TECHNICAL REPORT STANDARD TITLE PAGE

1. Report No. DOT/HS-800 700	2. Government Accession No.	3. Recipient's Catalog No.	
4. Title and Subtitle Drinking Driver and Traffic Safety Project, Vol. II, Probabilities for Drinking Drivers.		5. Report Date October, 1973	6. Performing Organization Code
7. Author(s) A. W. McEachern		8. Performing Organization Report No.	
9. Performing Organization Name and Address University of Southern California Public Systems Research Institute Los Angeles, California 90007		10. Work Unit No.	11. Contract or Grant No. FH-11-7099
12. Sponsoring Agency Name and Address U. S. Department of Transportation National Highway Traffic Safety Administration Washington, D.C. 20590		13. Type of Report and Period Covered Final Report 1968-1972	
		14. Sponsoring Agency Code 43-40	
15. Supplementary Notes			
16. Abstract This is the second volume of a final report of a four-year study of drinking drivers. It includes a brief description of a prediction model developed from over 4000 cases, including drinking drivers, recidivist drinking drivers and drivers license applicants who had never been convicted of drunk driving. Tables of probabilities of being a drunk driver (as opposed to not being a drunk driver) and of being a recidivist drunk driver (as opposed to a one-time drunk driver) are presented. The five variables used in the prediction model are: education, total number of minor traffic violations, age, number of accidents, and total number of non-traffic arrests. The probabilities associated with all possible combinations of characteristics on these five variables are presented, along with a brief description of how they might be used as aids to administrative or judicial decisions.			
17. Key Words Alcohol Safety, Alcohol Prediction Tests Prediction of DWI, Prediction of Recidivism, Tests for Court Use		18. Distribution Statement Unlimited available through the National Technical Information Service, Springfield, Virginia 22151

PROBABILITY ESTIMATES FOR DRINKING DRIVERS

EXPLANATORY NOTES

This second volume of the final report of the Drinking Driver and Traffic Safety Project includes probability estimates for drunk-driving, and for recidivist drunk-driving, for all possible combinations of the characteristics of five variables used in the prediction models. A complete description of the development and components of the model is included on pages 41 through 54 of the first volume of this report. This brief introduction to the tables of probabilities describes how they might be used by administrative or judicial decision makers.

The tables consist of lists of five digit index numbers, and for each of these, two probability estimates. The first probability of each pair refers to the likelihood or chances that an individual with characteristics represented by the index numbers would fall into the class of individuals who have been convicted of drunk-driving (as opposed to the class of individuals who have not been convicted of drunk-driving). The second probability of each pair refers to the likelihood or chances that an individual with characteristics represented by the index number would fall into the class of drunk drivers who will repeat a drunk driving offense (as opposed to those who will commit only one drunk driving offense). More briefly, the first number is the probability that an individual is a drunk-driver, and the second, the probability that he is a recidivist drunk-driver.

The second probability is most likely to be useful for judicial decision makers, and the first for administrators responsible for issuing drivers' licenses. Both should be interpreted with caution, however, and with awareness of the source of these probability estimates. Everyone who

might make use of the information in these tables is therefore urged to read that section of Volume I of this report which describes in detail how this prediction model was developed (pages 41-54).

The index numbers are obtained by combining the digits for the coding categories on the following five items of information: education, number of minor traffic violations during the past three years, age, number of traffic accidents during the past three years, and total number of non-traffic arrests (lifetime record). A simple form such as the following, can be used to generate index numbers.

Characteristics Used to Develop Index Numbers
for Probability Estimates

a. Education:

- 0=no information available
- 1=grades 1-6
- 2=grades 7-9
- 3=grades 10-12
- 4=high school diploma
- 5=some college
- 6=Bachelor's degree
- 7=graduate work or professional degree

b. Number of minor Traffic Violations
(past three years)

- 0=no information available
- 1=none
- 2=one
- 3=two
- 4=three
- 5=four
- 6=five
- 7=six to nine
- 8=ten or more

c. Age

- 0=no information available
- 1=21 or under
- 2=22-23
- 3=24-26
- 4=27-29
- 5=30-35
- 6=36-40
- 7=41-45
- 8=46-50
- 9=over 50

d. Number of Traffic Accidents (past 3 yr.)

- 0=no information
- 1=none
- 2=one
- 3=two or more

e. Total number of Arrests
(lifetime-non-traffic)

- 0=no information
- 1=none
- 2=one
- 3=two-three
- 4=four-five
- 5=six or more

INDEX NUMBERS=

a	b	c	d	e

The following index number

a	b	c	d	e
2	5	2	0	3

, for example, is for an individual who has completed grades 7-9 (a 2 is entered in the 'a' position), has had four traffic violations during the past three years (a 5 is entered in the 'b' position), is 22-23 years of age (a 2 is entered in the 'c' position), for whom no information is available about the number of traffic accidents during the past three years (a 0 is entered in the 'd' position), and who has had two or three arrests for non-traffic and non-drunk-driving offenses during his lifetime (a 3 is entered in the 'e' position). The probabilities associated with these characteristics are .614 for drunk driving and .518 for recidivist drunk driving, given that an individual with these characteristics has already committed one drunk-driving offense.

An individual who differed from this one with respect to the number of traffic accidents he had had during the past three years (he had two or more) and the number of arrests during his lifetime (six or more) so that his index number is

a	b	c	d	e
2	5	2	3	5

 would have probabilities of .783 for drunk driving, and of .802 for recidivist drunk driving.

Interpreting Probabilities

Certainly it is offensive to any sense of justice that an individual should be treated or punished solely on the basis of probabilities derived from the behavior of other individuals with whom he shares certain characteristics. The probabilities do not explain the cause of drunk-driving, nor do they tell us what to do about it. But they do provide an intelligent indication of where we can most profitably look for a solution. They can most appropriately be used in the way we would use a traffic engineer's report which identifies those intersections in a city where most accidents occur. We still have to determine whether a given intersection requires

stop-lights, cross-walks, or road-widening, but at least we have a better idea of where to focus our resources in attempting to solve the problem.

Probabilities are numerical ways of expressing uncertainty. Sometimes these numbers are based on historical data (as in the case of the probability estimates included in these tables), sometimes they are based on subjective judgments or the combination of subjective judgments (as in the case of odds at the race track), and sometimes they are based on theory (another form of subject judgment) combined with historical data (as in the case of odds that certain combinations of dice will occur). No matter where the numbers come from, their meaning is a matter of individual judgment: the same numbers can mean quite different things to two different individuals, and to the same individual at different times or under different circumstances. If the probability or odds of 1 to 4 applied to your being killed on a particularly dangerous roadway, you would not only hesitate, you would probably avoid it at all costs. Just as the circumstances would influence the meaning these numbers have for your behavior, so would the source of the probability estimates. If you knew that a local police department had provided these estimates based on careful records you would have more confidence in them than if you knew they came from a timorous elderly lady from Pasadena who had not ventured beyond her corner store for many years, and on foot at that.

The meaning of probabilities therefore is conditioned by what is to be done (what decision will be influenced by them) and where they came from. For example, when these index numbers were developed for each member of the samples on which the prediction models are based, it was found that the resulting probabilities corresponded very closely to the number of cases for which correct predictions were made. That is, of all those whose index number was associated with a probability of being a drunk driver of .80, 80% actually were drunk drivers. Similarly, only 10% of those with a probability of .10 were drunk drivers. The same degree of correspondence holds for the recidivist probabilities. Fifty percent of those who have a probability of .50 were in fact recidivist drunk drivers, and 50% were not. This finding, which was consistent across the range of probabilities for both prediction models, provides one basis for interpreting the probabilities of this report. If an individual who has been convicted of drunk driving had the index number given in the last example (25235) the probability that he would be a recidivist drunk driver given in the tables is .802. This could be interpreted to mean that eighty percent of the individuals who have index numbers like this one are in fact recidivist drunk drivers.

The decisions that will be influenced by these tables is a matter of individual, official or judicial judgment, for which the present data can provide no guidance. It seems intuitively reasonable, nevertheless, that knowing a convicted drunk driver has characteristics which result in a probability of .80 of being a recidivist, and that in the sample on which the model is based 80% of the individuals who received such a probability actually were recidivists, should influence recommendations or dispositions for that individual. But it should be kept in mind that if everyone with

such a probability is treated as if he is a recidivist, then in 20% of those cases, an error will have been made. The amount of error a system, a judge, or an individual can tolerate is a matter of personal judgment.

A. W. McEachern
