16. Abstract

This report presents a description of a vehicle simulation program, which can determine the fuel economy and performance of a specified motor vehicle over a defined route as it executes a given driving schedule. Vehicle input accommodated by HEVSIM include accessories, engine, rear axle, converter, transmission, tires, aerodynamic drag coefficient, and shift logic. The report consists of three volumes. Volume I presents a description of the numerical approach and equations, Volume II is a user's manual, and Volume III contains the program listings.

PREFACE

Volume III is the third and last volume of a three volume document describing the computer program HEVSIM. This volume includes appendicies which list the HEVSIM program, sample part data, some typical outputs and updated nonmenclature.

METRIC CONVERSION FACTORS

Approximate Conversions to Metric Measures

Lengend - FOR20

NAME - name of routine (see below) where data originates

NUM - location in routine where data originates

I - segment type

M - engine map location

T - time (sec)

TOLD - time (sec) during previous time step

DT - time step size (sec)

D - incremental distance (miles)

V - vehicle velocity (miles/hour)

ACCEL - vehicle acceleration (ft/sec^2)

TORQE - engine torque (lb-ft)

RPME - engine speed (rev/min)

TORQA - accessory torque (lb-ft)

TORQ1 - torque at input to torque converter

RPM1 - Speed at input to torque converter

TORQP - propshaft torque (lb-ft)

RPMP - propshaft speed (rev/min)

BRAKES - Brake force (lb)

Routine "Name" abbreviations

GOBAK - GOBACK

ITERA - ITERAT

SIMCT - SIMCTR

SHIFT - SHIFTS

LEGEND-FOR21

RPMC - input speed to gears (rev/min)

SR - speed ratio-torque converter

TR - torque ratio

TORQW - torque at the wheels (lb-ft)

RPMW - speed at the wheels (rev/min)

TRR - torque at the rear end (lb-ft)

TORQF - torque at the front end (lb-ft)

TORQ - torque from the engine map (lb-ft)

FWHEEL - wheel force (lbs)

FAERO - aerodynamic force (lbs)

FACCEL - acceleration force (lbs)

FROLL - rolling resistance force (lbs)

RPM2 - torque converter output speed (rev/min)

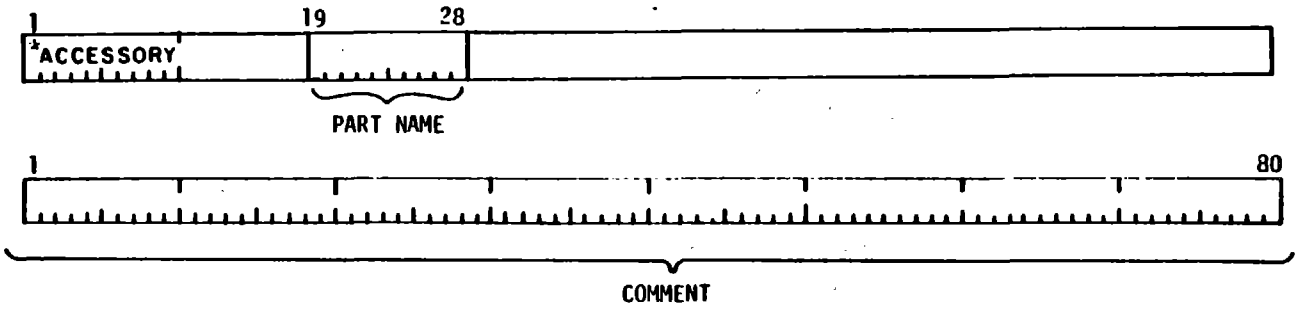
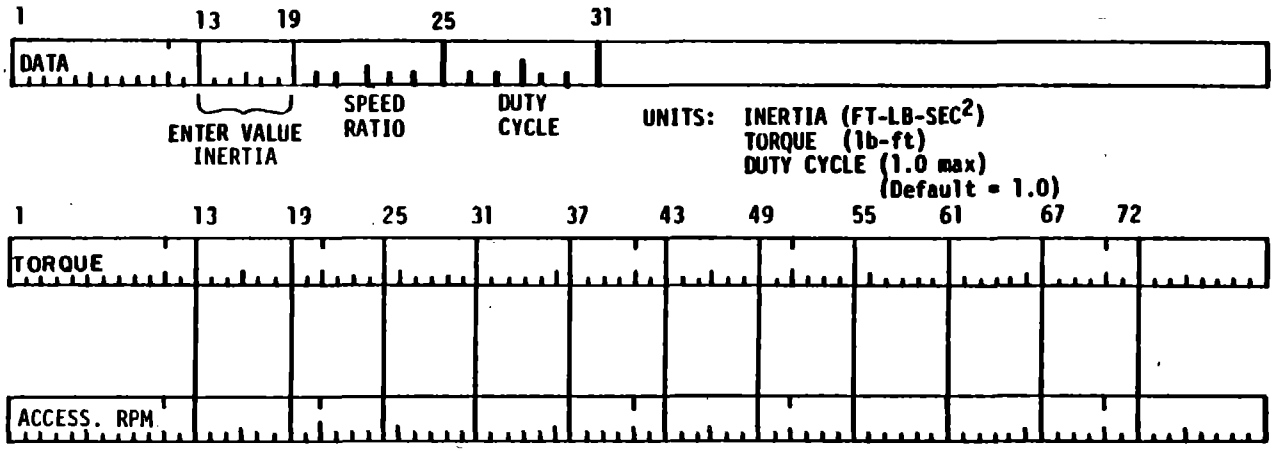
APPENDIX B

Updated Data Sheets

DATA SHEET 1. ACCESSORY

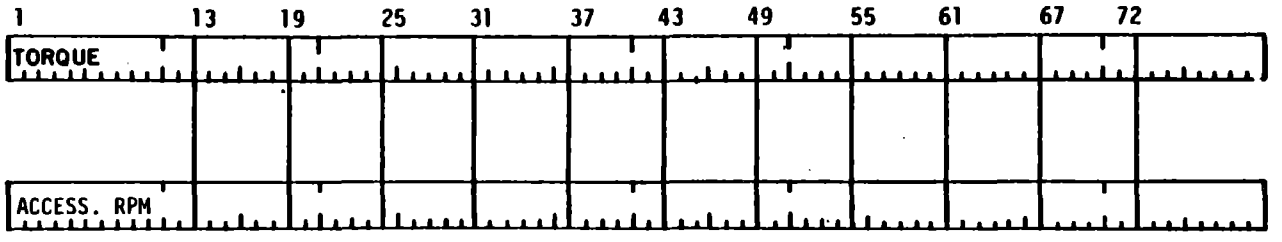


NOTE: ENTER ALL DATA WITH A DECIMAL POINT

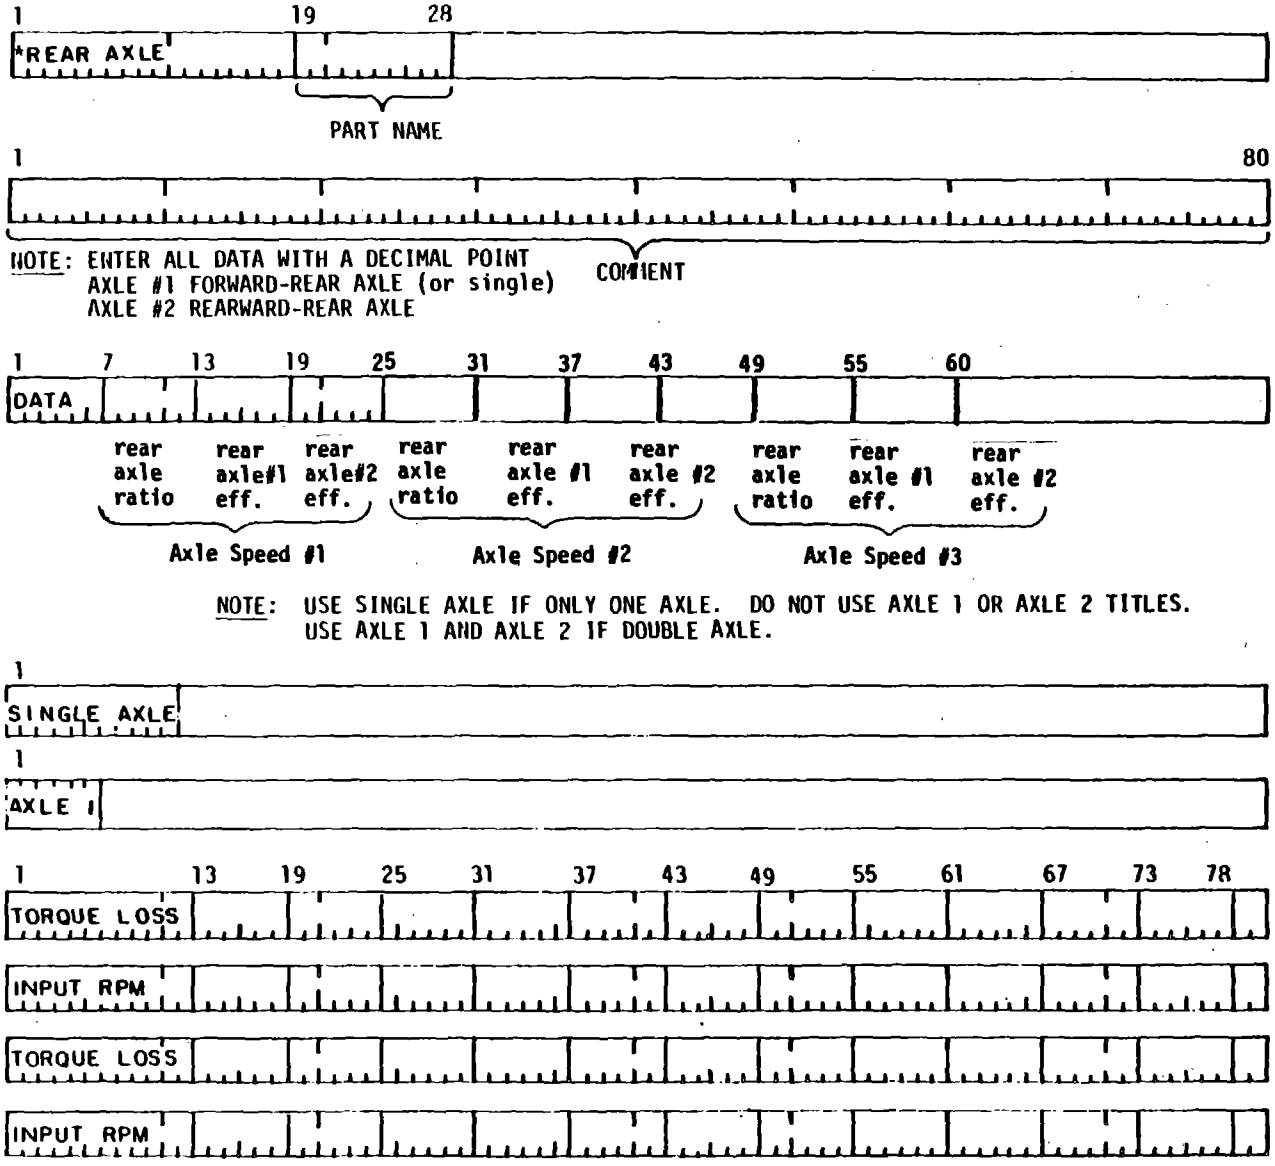


→ INCREASING RPM, FILL SPACES WITH DATA POINTS AS NEEDED UP TO 20 POINTS MAXIMUM

USE ONLY WHEN MORE THAN 10 DATA POINTS TO BE ENTERED

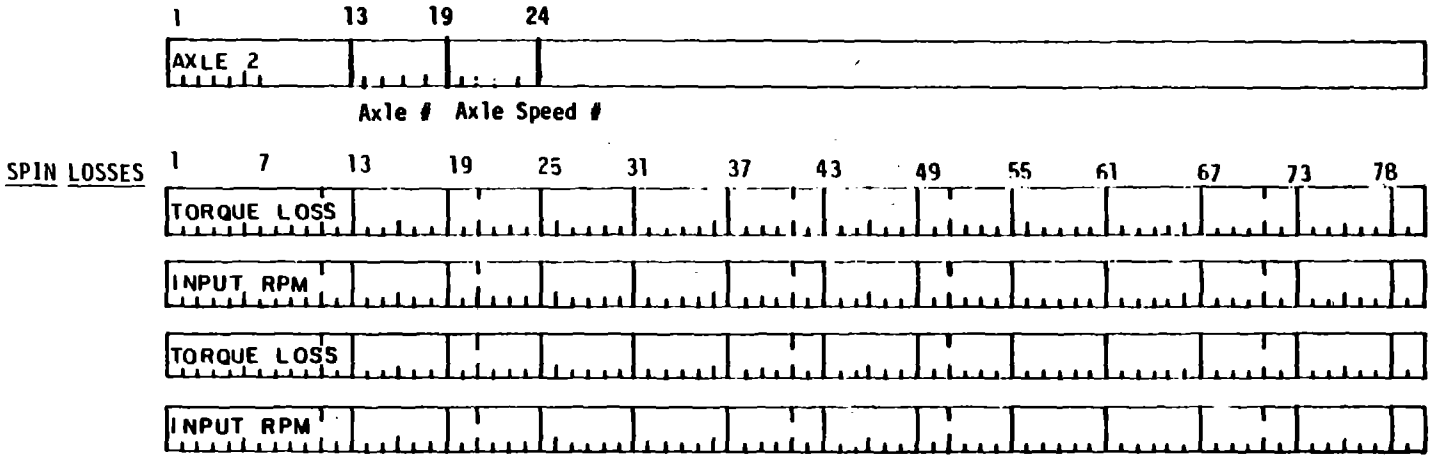


DATA SHEET 2. REAR AXLE (Sheet 1 of 2)

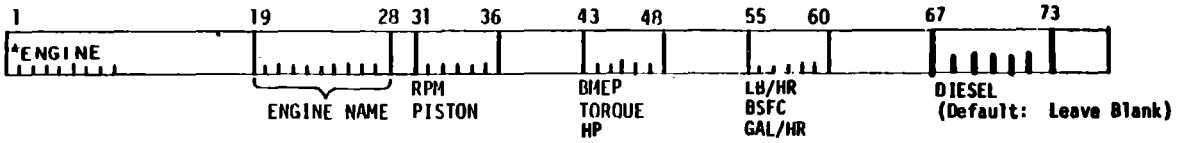


DATA SHEET 2. REAR AXLE (Sheet 2 of 2)

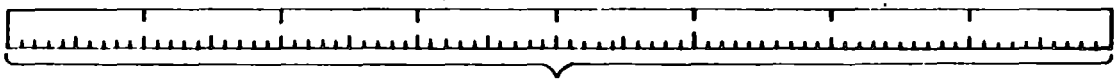
NOTE: ENTER ALL DATA WITH A DECIMAL POINT
TORQUE LOSS IN UNITS OF: LB-FT



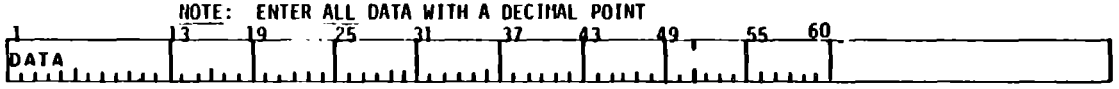
DATA SHEET 3. ENGINE (Sheet 1 of 2)



(ENTER ONE OF ABOVE FOR EACH SET OF UNITS)

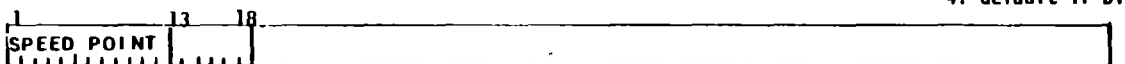


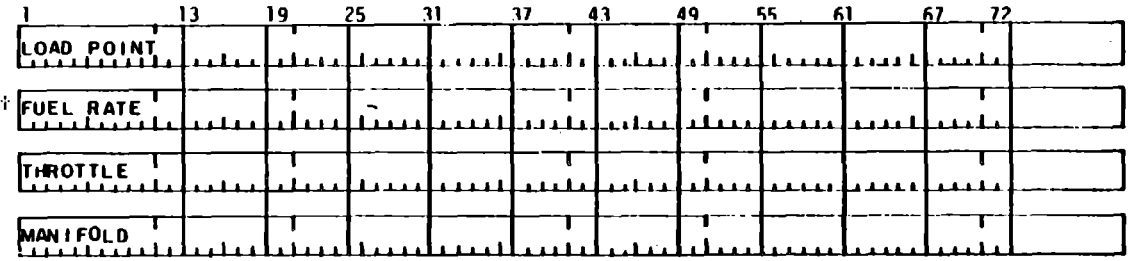
NOTE: ENTER ALL DATA WITH A DECIMAL POINT



*0.764 default if blank
*Use 0.1198 for emissions
**4. default if blank

REPEAT SPEED POINT SETS AS NEEDED UP TO 20 SPEED PTS.





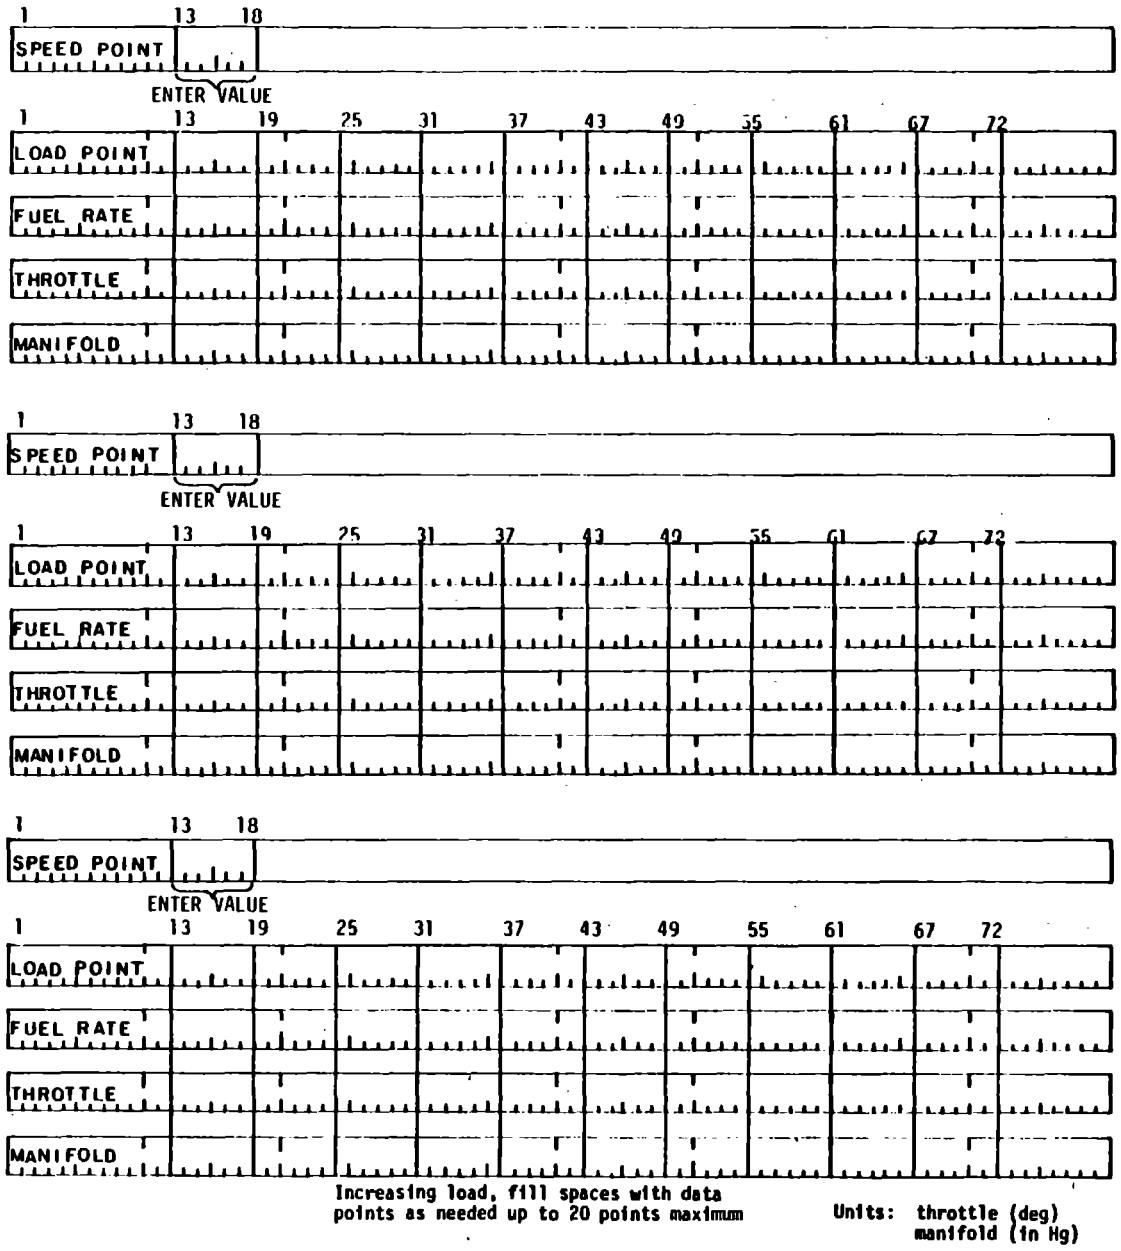
→ INCREASING LOAD, FILL SPACES WITH DATA POINTS AS NEEDED UP TO 20 POINTS MAXIMUM

UNITS: THROTTLE (DEGREE)
MANIFOLD (in. Hg.)

USE ONLY WHEN MORE THAN 10 DATA POINTS TO BE ENTERED

†Emission rate (gm/hr) may be entered in FUEL RATE data field. See also *notes.

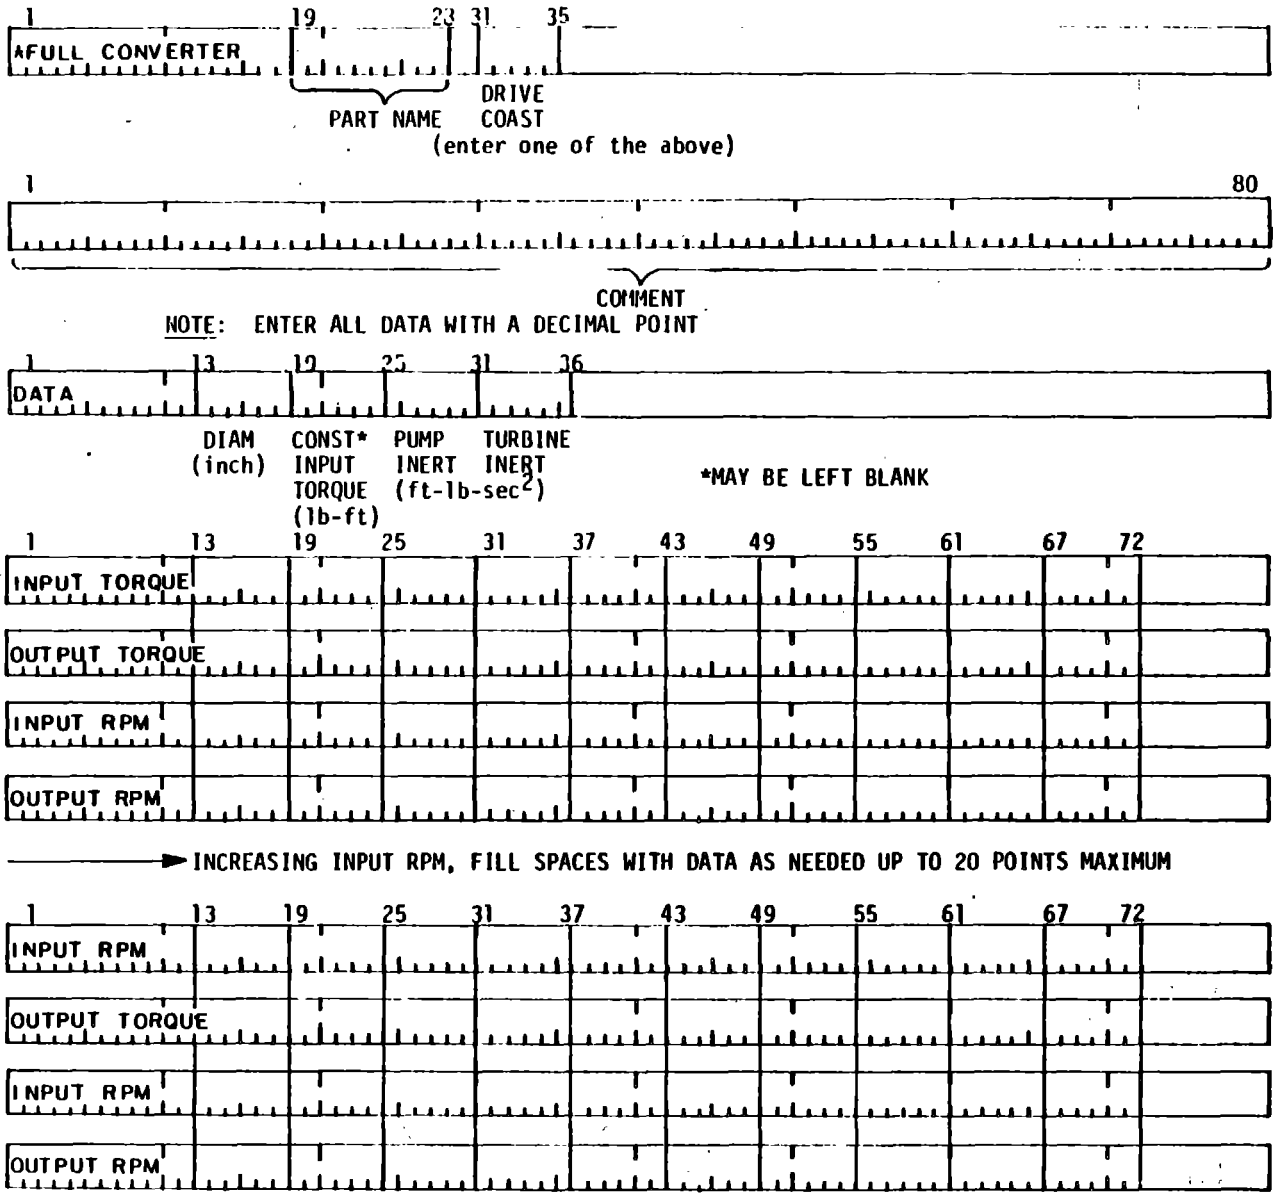
DATA SHEET 3. ENGINE (Sheet 2 of 2)



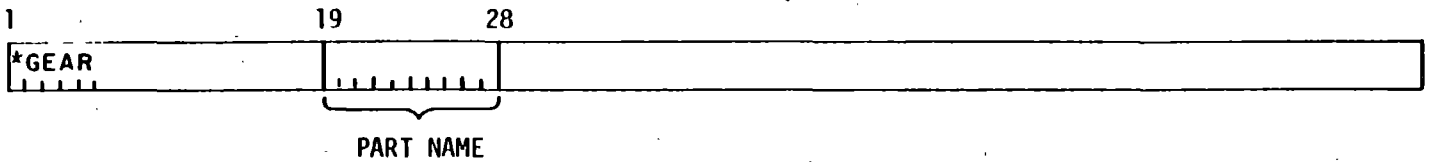
Increasing load, fill spaces with data points as needed up to 20 points maximum

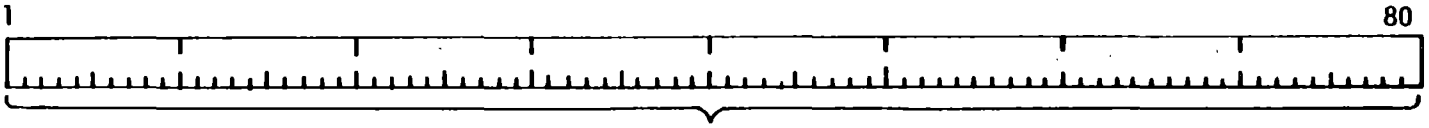
Units: throttle (deg)
manifold (in Hg)

DATA SHEET 4. FULL CONVERTER

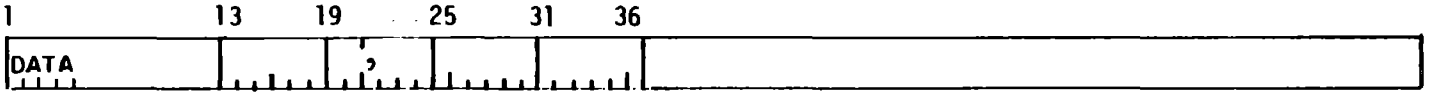


DATA SHEET 5. GEAR





NOTE: ENTER ALL DATA WITH A DECIMAL POINT
TORQUE LOSS IN UNITS OF: LB-FT



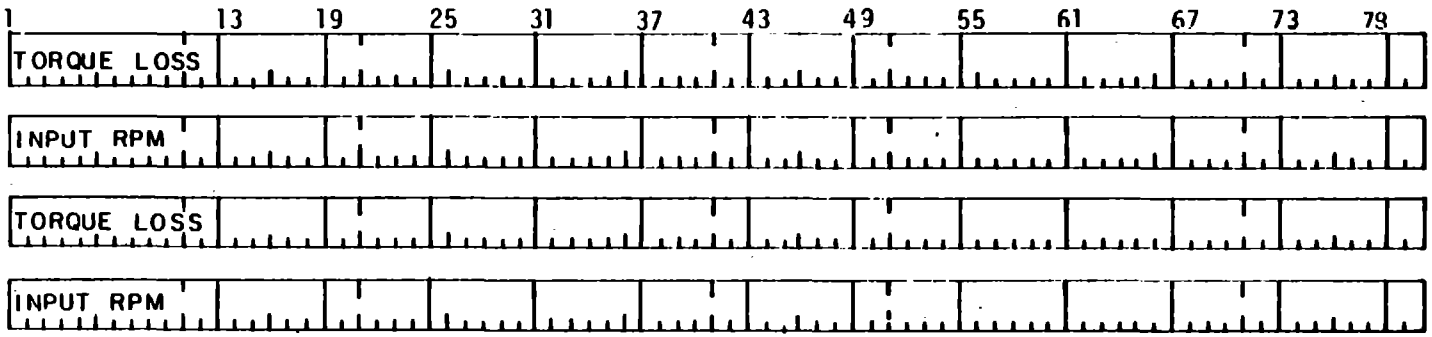
GEAR INPUT INERTIA (ft-lb-sec^2)

GEAR OUTPUT INERTIA

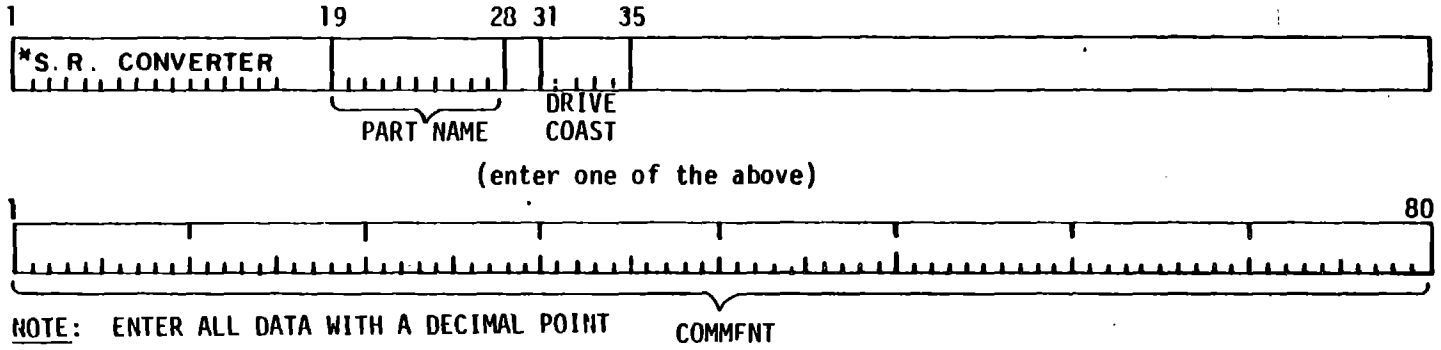
GEAR RATIO

GEAR LOAD EFFICIENCY (1. max)

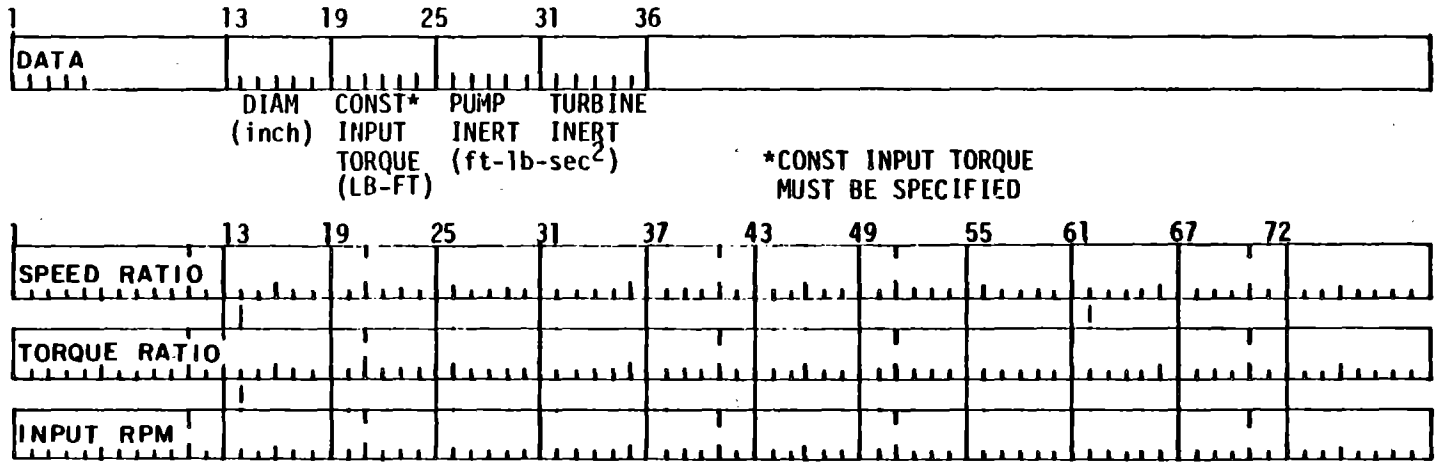
SPIN LOSS



DATA SHEET 6. SPEED RATIO CONVERTER

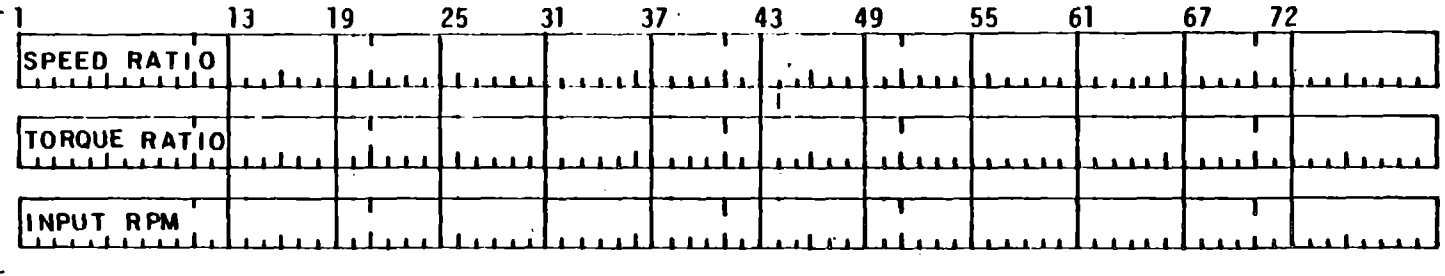


NOTE: ENTER ALL DATA WITH A DECIMAL POINT

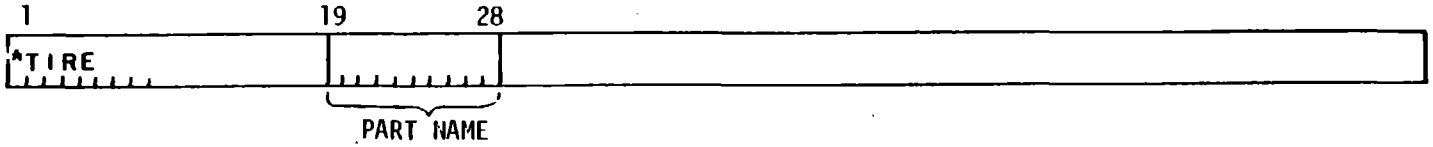


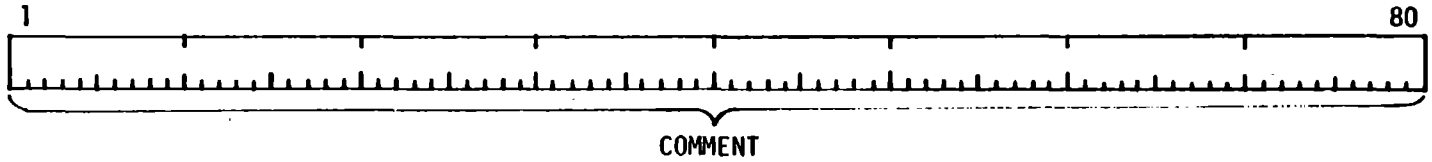
→ INCREASING RPM, FILL SPACES WITH DATA AS NEEDED UP TO 20 POINTS MAXIMUM

USE ONLY WHEN MORE THAN 10 DATA POINTS TO BE ENTERED

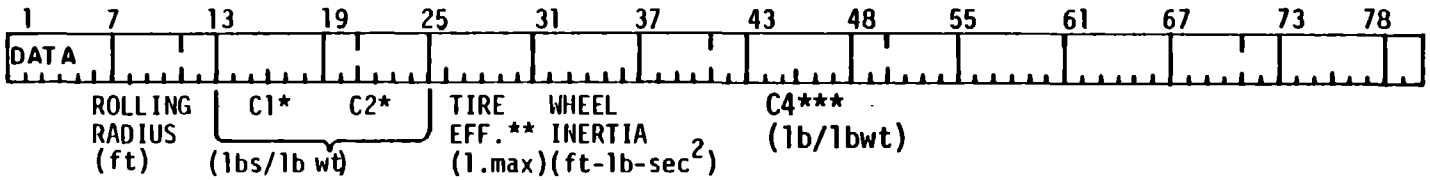


DATA SHEET 7. TIRE





NOTE: ENTER ALL DATA WITH A DECIMAL POINT

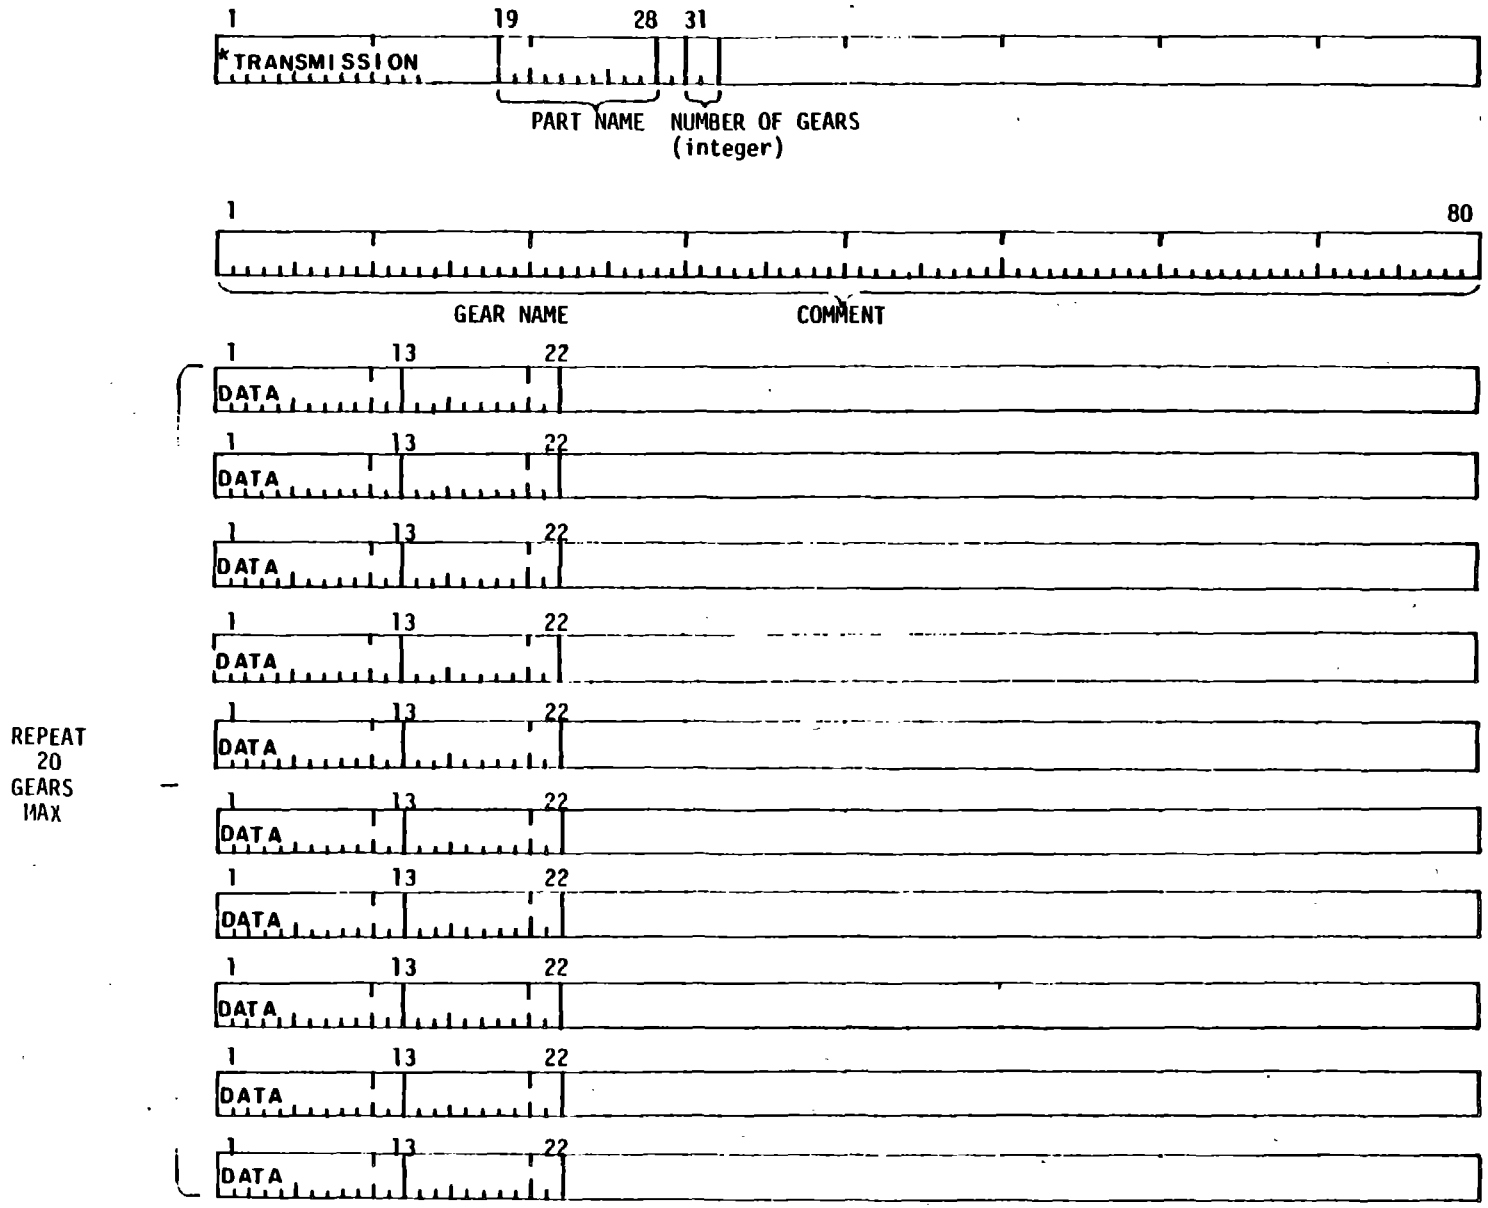


*Rolling resistance coefficients. Make C2 zero for linear approximation.

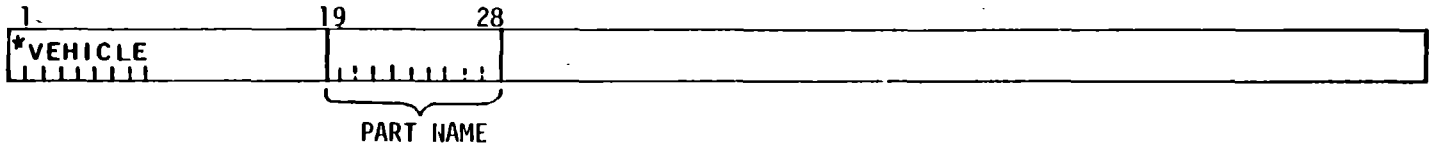
**Tire slip effect due primarily to road surface

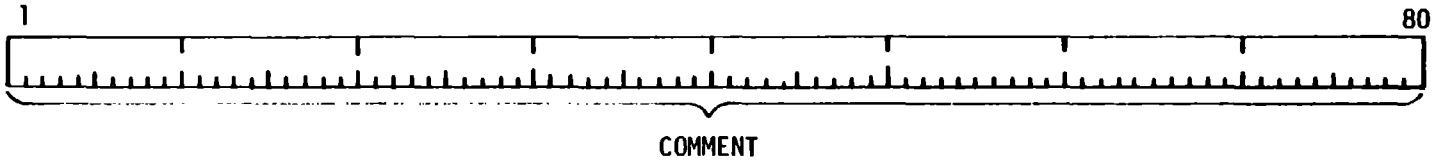
***Bearing Loss Coefficient, default value of 0.0004

DATA SHEET 8. TRANSMISSION

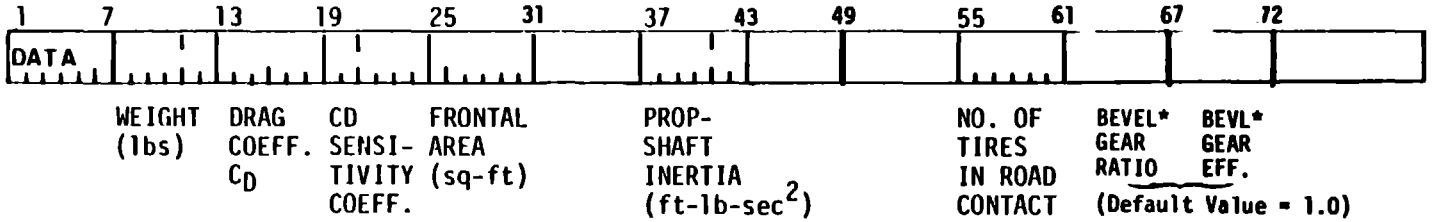


DATA SHEET 9. VEHICLE

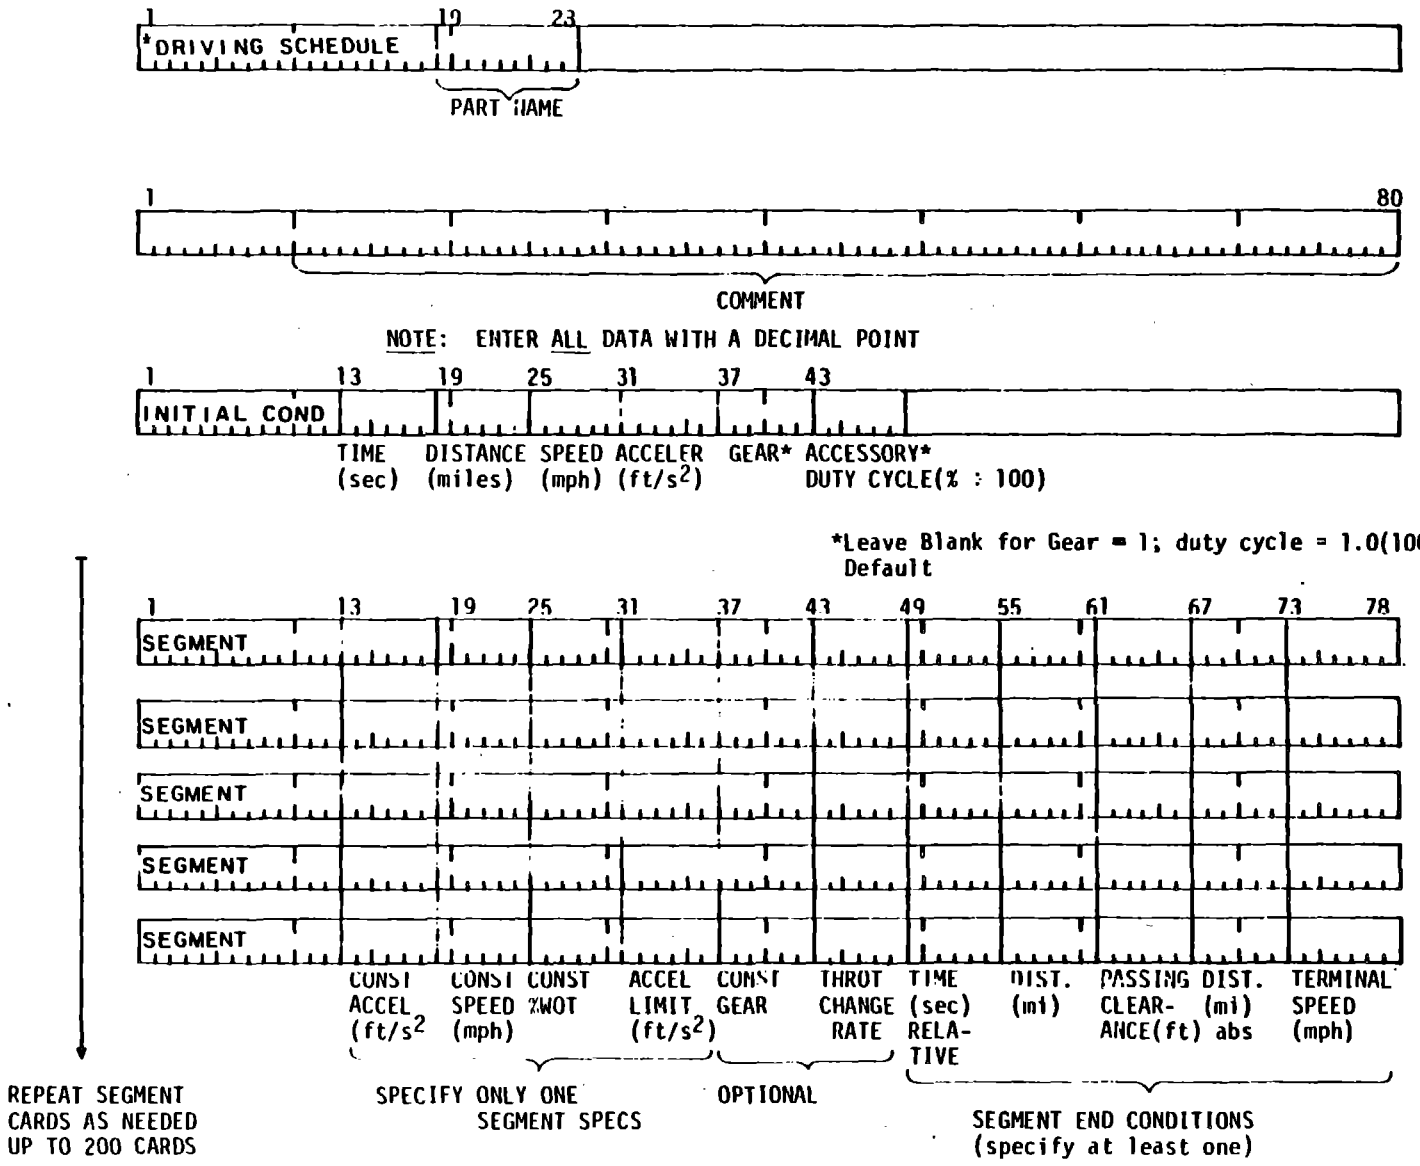




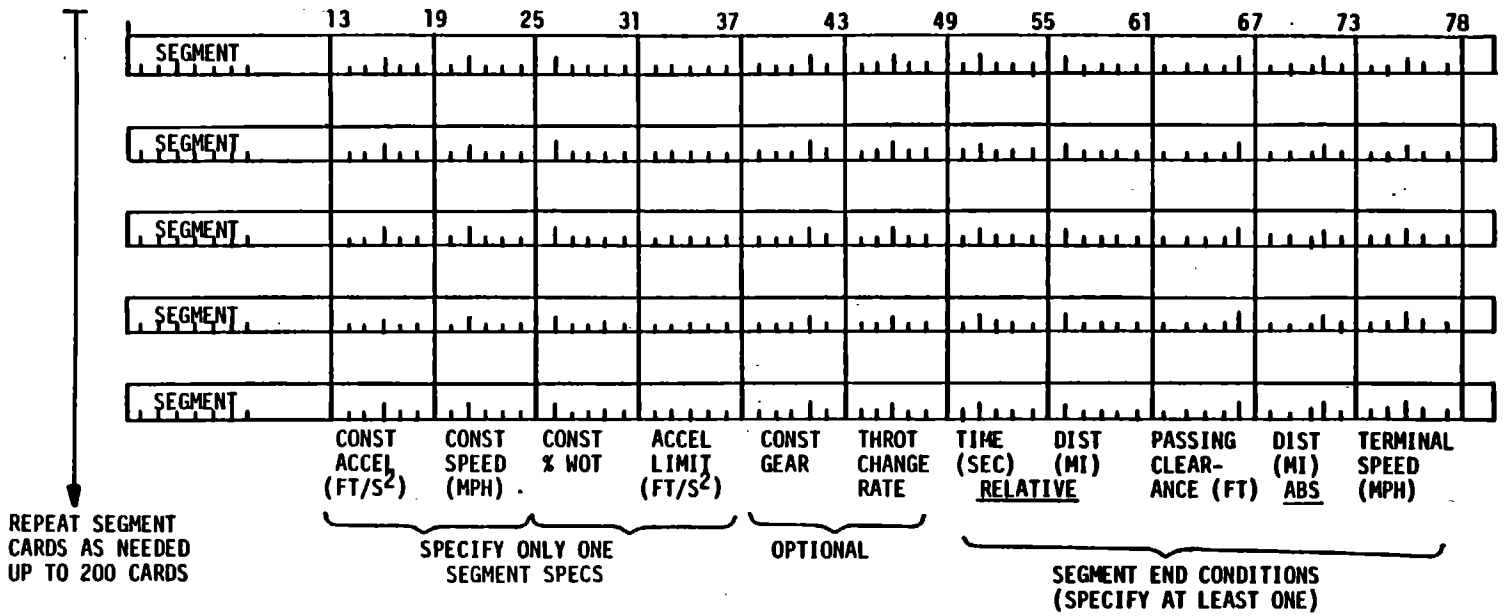
NOTE: ENTER ALL DATA WITH A DECIMAL POINT

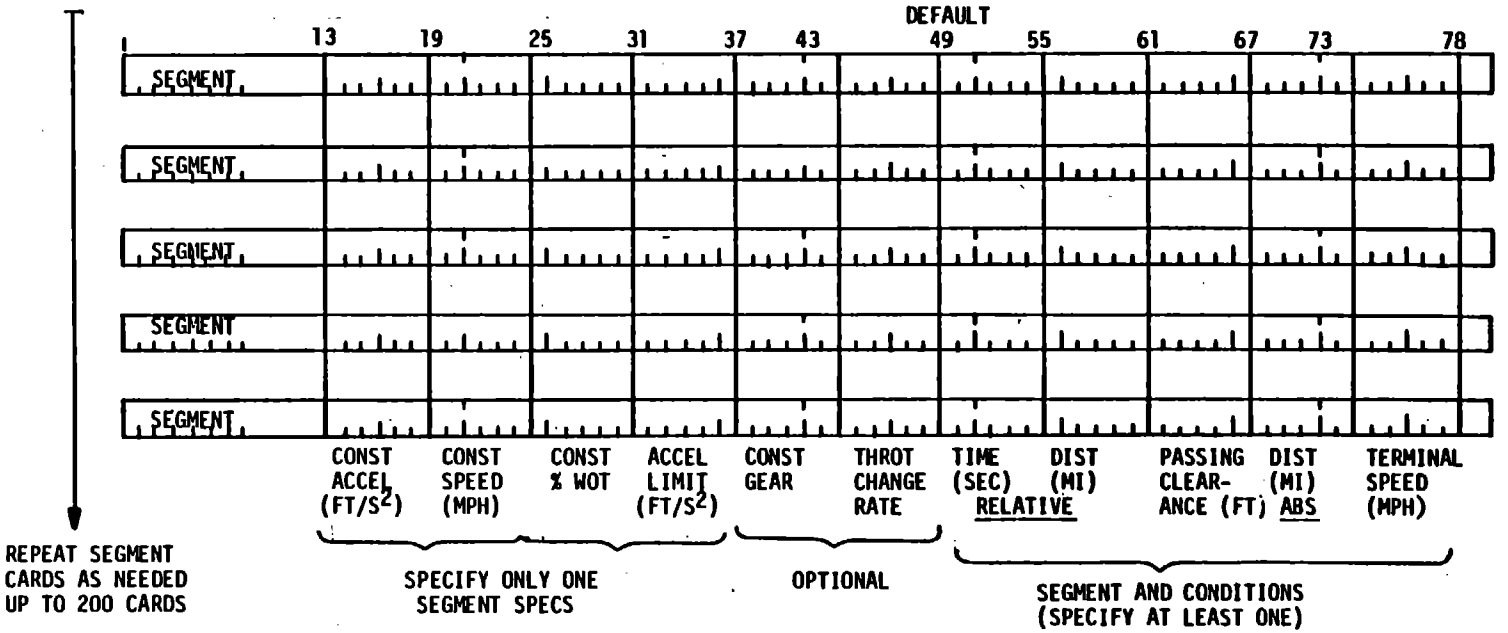


DATA SHEET 10. DRIVING SCHEDULE (Sheet 1 of 2)

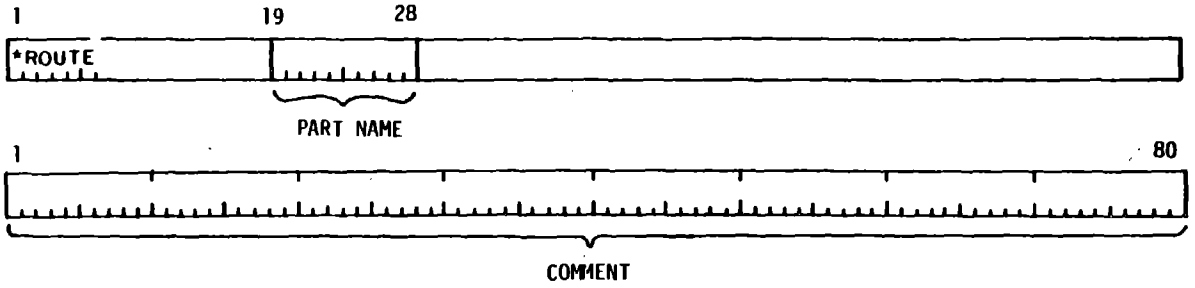


DATA SHEET 10. DRIVING SCHEDULE (Sheet 2 of 2)



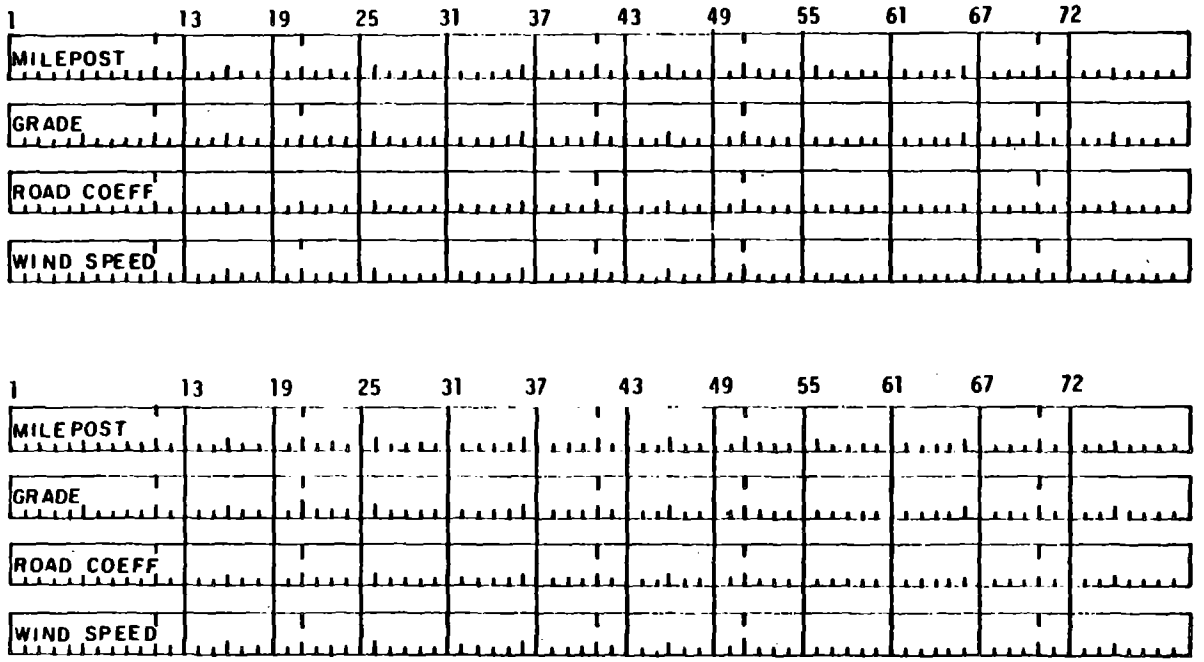


DATA SHEET 11. ROUTE



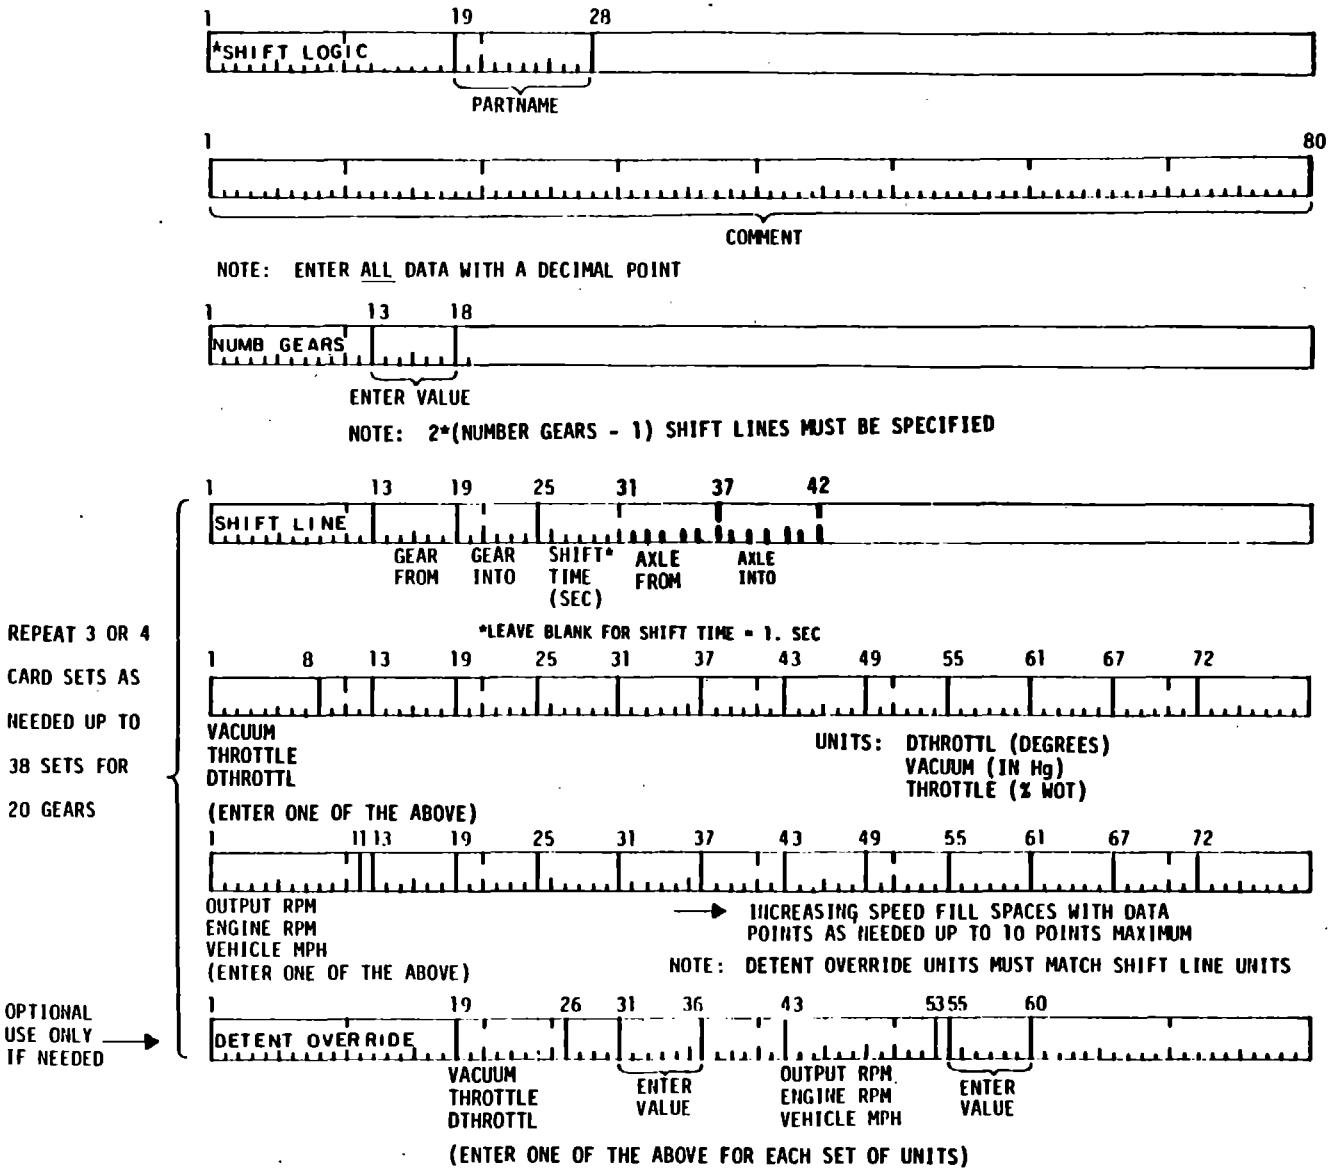
NOTE: ENTER ALL DATA WITH A DECIMAL POINT
SPECIFY GRADE AND ROAD COEFF FOR
UP TO THE DATA POINT MILEPOST

UNITS: MILEPOST (absolute miles)
GRADE (%)
ROAD COEFF (1.0 max)
WIND SPEED (mph)

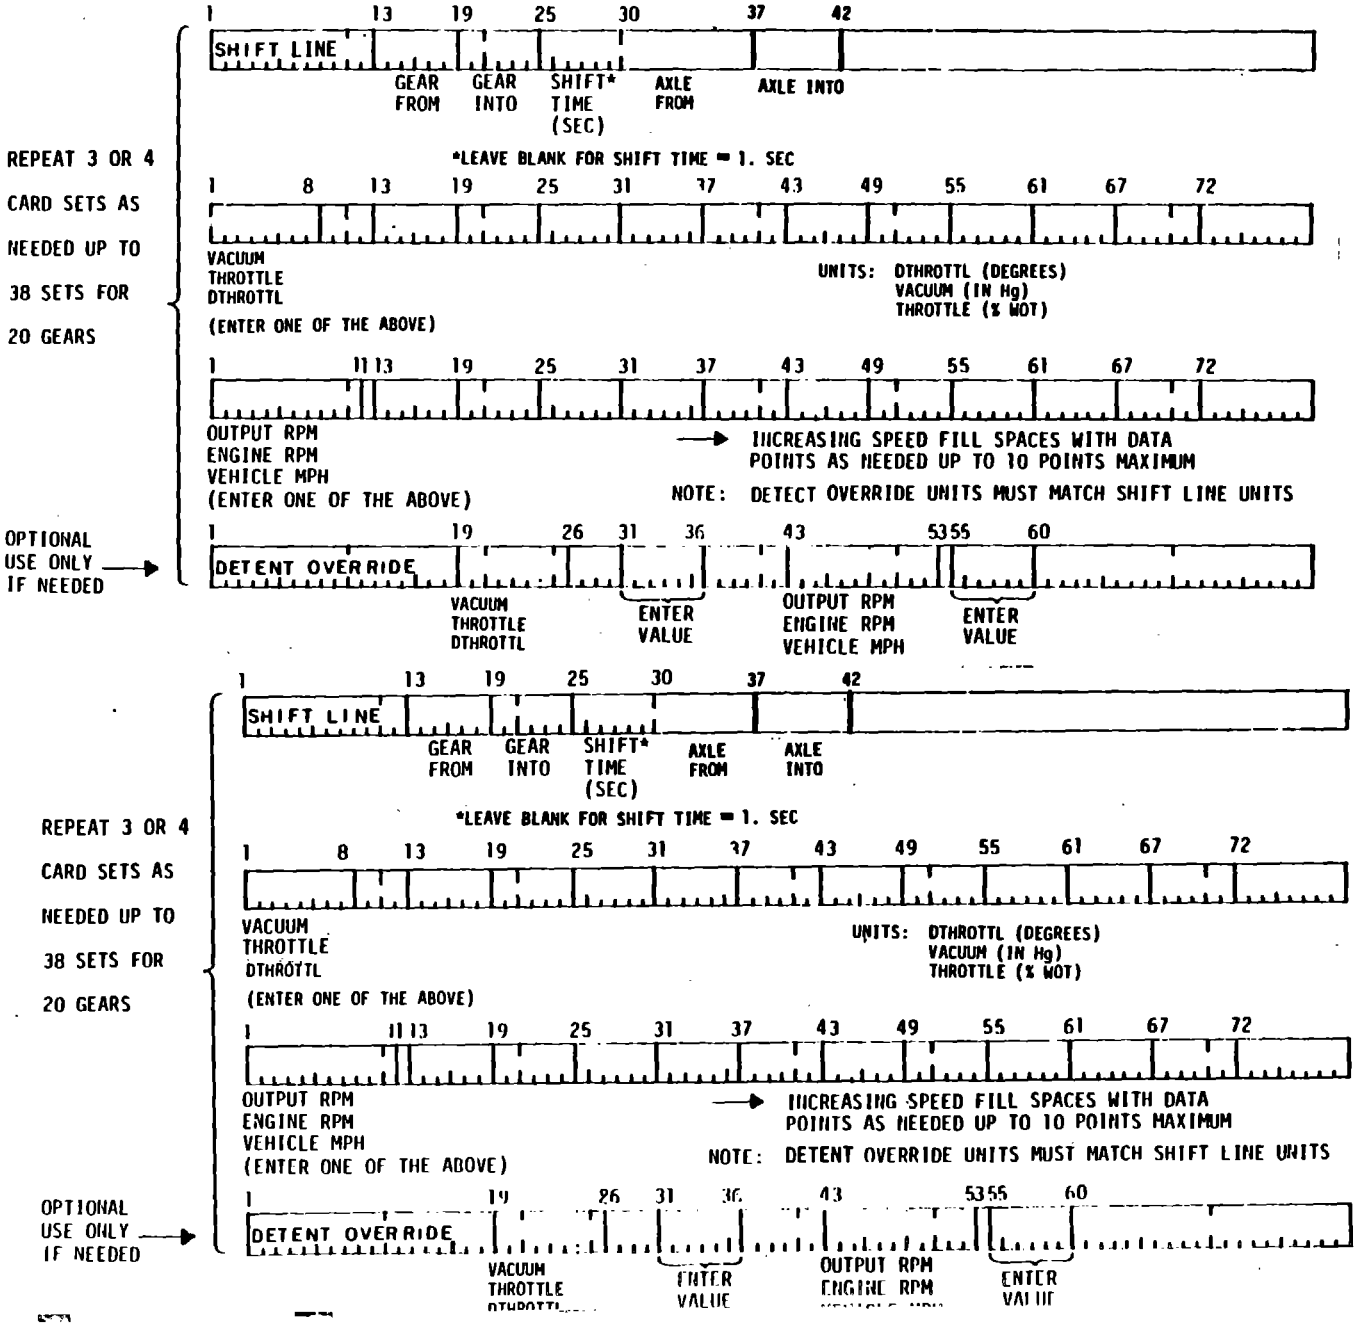


REPEAT 4-CARD SETS AS NEEDED UP TO 10 SETS (100 points maximum)

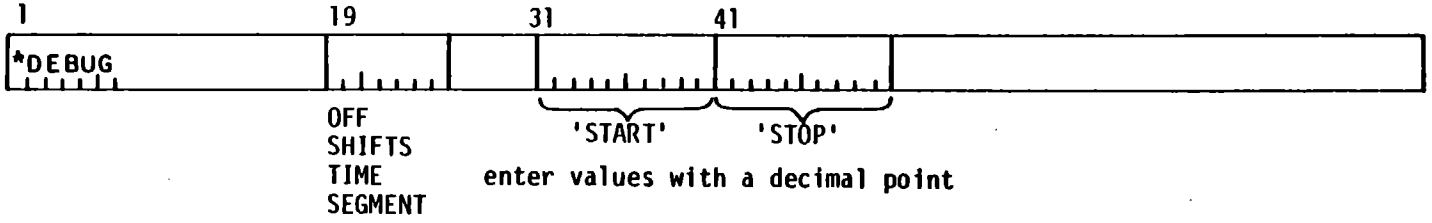
DATA SHEET 12. SHIFT LOGIC (Sheet 1 of 2)



DATA SHEET 12. SHIFT LOGIC (Sheet 2 of 2)

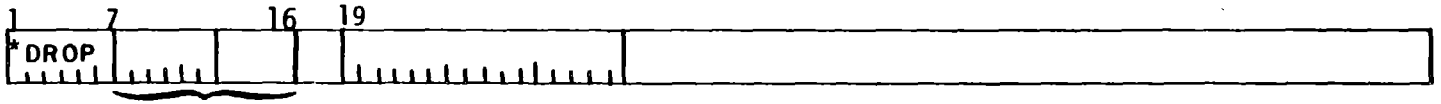


DATA SHEET 13. DEBUG



NOTES: FOR SHIFTS AND SEGMENT, ENTER SEGMENT NUMBERS
FOR TIME, ENTER VALUES IN SECONDS
IF NO 'START' SPECIFIED, DEBUG PRINTOUT STARTS AT BEGINNING OF RUN
IF NO 'STOP' SPECIFIED, DEBUG PRINTOUT CONTINUES TO END OF RUN

DATA SHEET 14. DROP

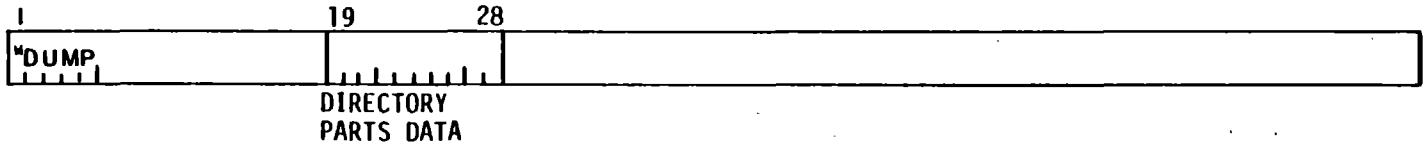


PART NAME

ACCESSORY
CONVERTER
DRIVING SCHEDULE
ENGINE
GEAR
ROUTE
SHIFT LOGIC
VEHICLE

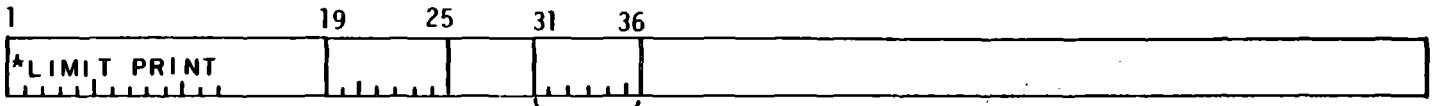
(enter one of the above)

DATA SHEET 15. DUMP



(enter one of the above)

DATA SHEET 16. LIMIT PRINT



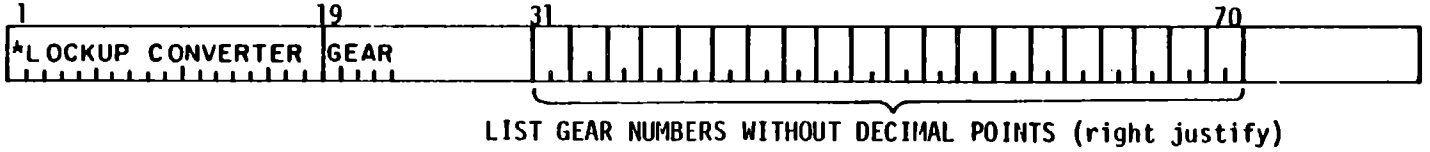
MILE
SEC
SEGMENT
OFF - FOR DETAILED PRINTOUT (including parts used data)
SUMMARY

ENTER VALUE FOR MILE, SEC WITH A DECIMAL POINT
(.1 mile, 10. sec defaults if no value entered)

(enter one of the above)

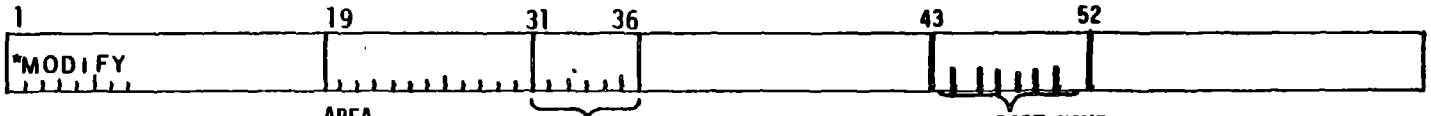
NOTE: IF NO LIMIT PRINT COMMANDED,
PRINTOUT IS SUMMARY ONLY

DATA SHEET 17. LOCKUP CONVERTER GEAR



NOTE: GEAR NUMBERS RANGE FROM 1 to 20

DATA SHEET 18. MODIFY



AREA
C1
C2
C4
CD
CYLINDERS
DIESEL
DISPLACEMENT
DUTY CYCLE
FUEL DENSITY
DYNAMOMETER
REAR AXLE R
STROKE
TIRE EFF
WEIGHT
WHEEL
WIND
IDLE
STEP
UPSHIFT
DOWNSHIFT
TRR
PHI

(enter one of the above)

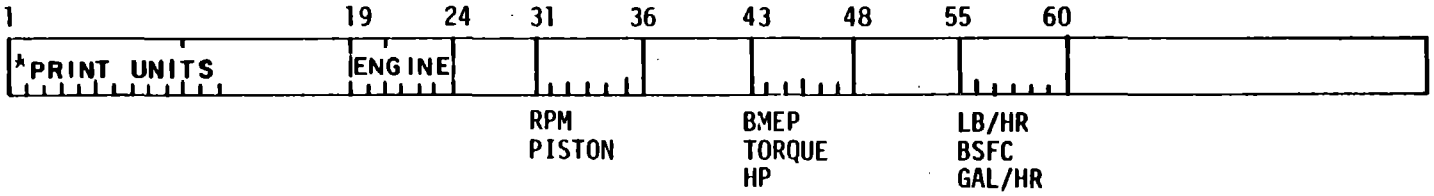
enter value with decimal point

PART NAME
OPTIMAL
(MUST USE WITH DUTY CYCLE)

Units:
AREA (sq. ft.)
DISPLACEMENT (cu in)
FUEL DENSITY (sp gr)
STROKE (in)
TIRE EFF (1. max)
WEIGHT (lbs)
WIND (mph)
IDLE (RPM)
STEP (sec) - default is .05 sec
UPSHIFT (+ % change in vac/throt)
DOWNSHIFT (+ % change in vac/throt)
PHI (Radians)
C_1, C_2, C_4 (lbs/lbwt)

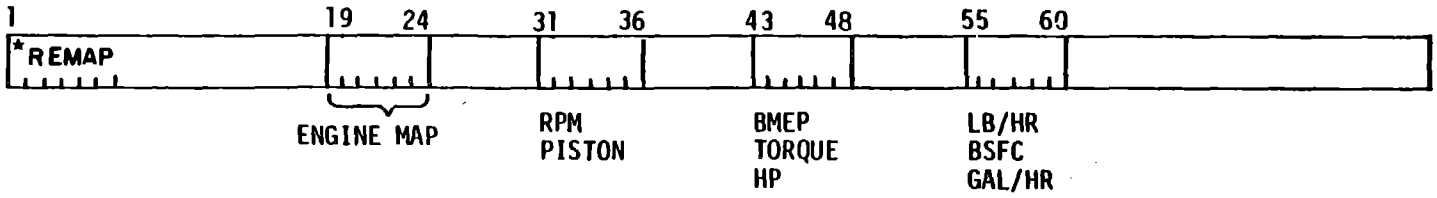
Enter Value with decimal point
(Note: Must specify accessory to be modified

DATA SHEET 19. PRINT UNITS



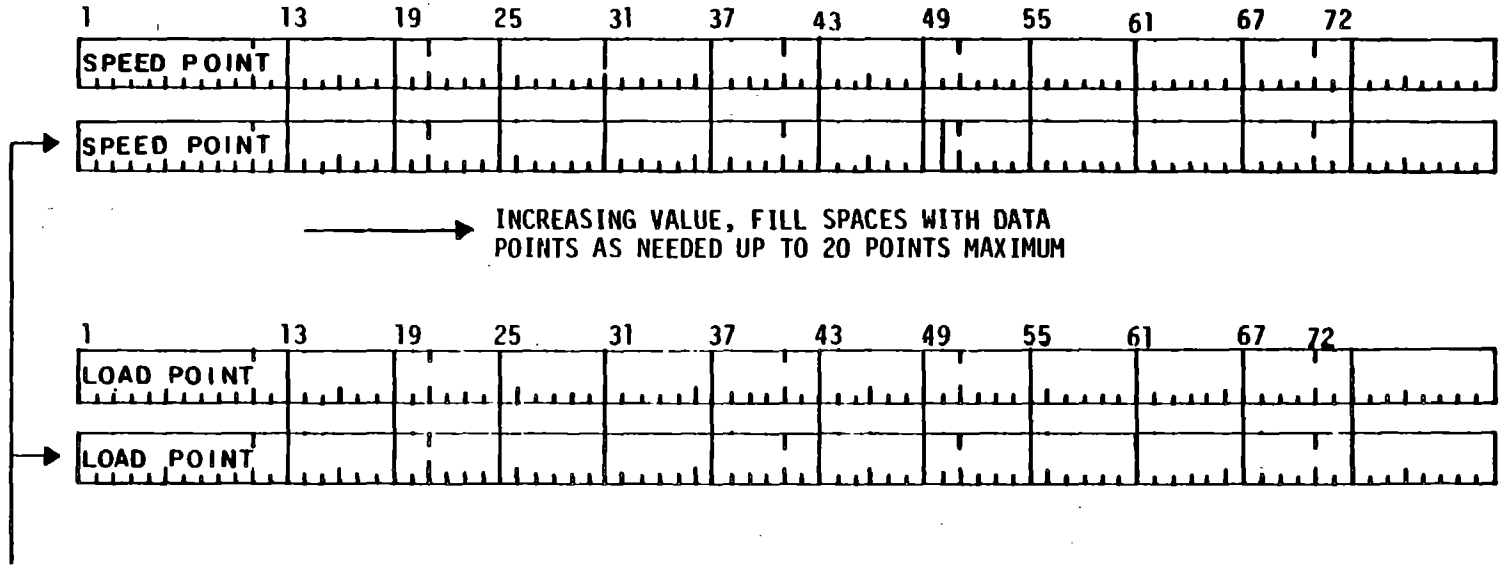
(enter one of the above for each set of units)

DATA SHEET 20. REMAP



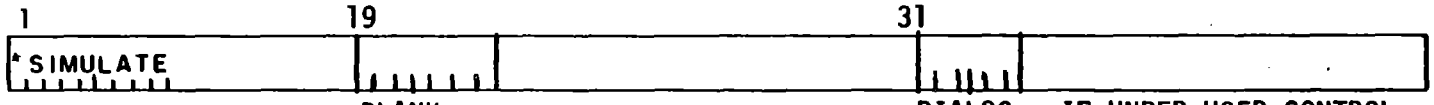
(enter one of the above for each set of units)

NOTE: ENTER ALL DATA WITH A DECIMAL POINT



USE ONLY
WHEN MORE
THAN 10
DATA POINTS
TO BE ENTERED
FOR EACH

DATA SHEET 21. SIMULATE

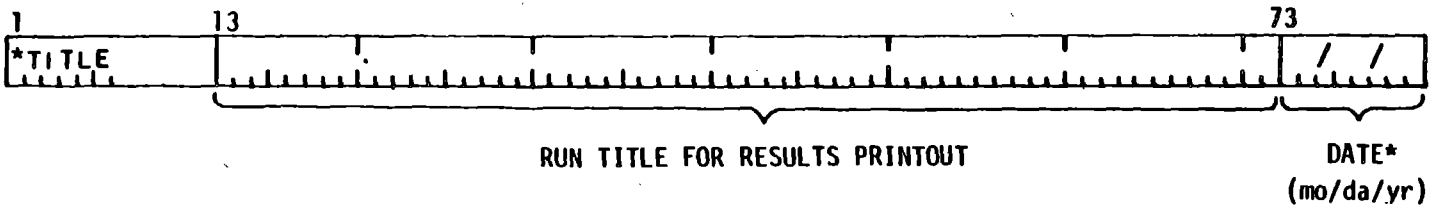


BLANK
TRUCK
BUS

(Default, Truck)

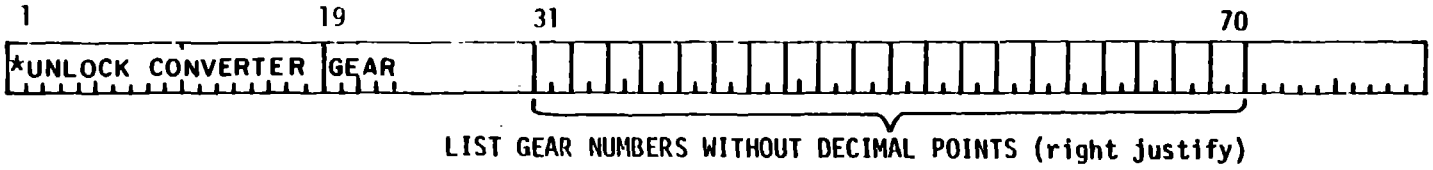
DIALOG - IF UNDER USER CONTROL,
BATCH GO TO COMMAND LEVEL
CONTI BEFORE SIMULATING

DATA SHEET 22. TITLE



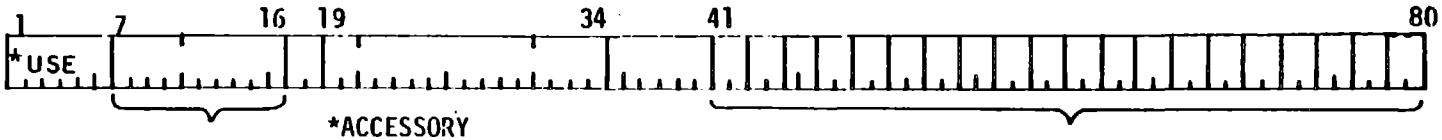
*Optional - insert to override actual date

DATA SHEET 23. UNLOCK CONVERTER GEAR



NOTE: GEAR NUMBERS RANGE FROM 1 TO 20

DATA SHEET 24. USE



PART NAME

*ACCESSORY
*CONVERTER
*DRIVING SCHEDULE
*ENGINE - LIST ALL GEARS TO BE USED WITH THE ENGINE
*GEAR - SPECIFY THE GEAR NUMBER THE GEAR IS TO BE USED FOR
*ROUTE
*SHIFT LOGIC
*VEHICLE

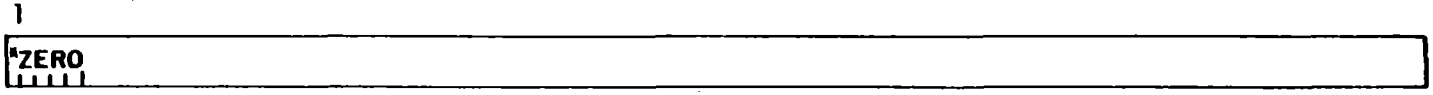
LIST GEAR NUMBERS WHEN REQUIRED WITHOUT DECIMAL POINTS
(right justified), gear numbers range from 1 to 20

(enter one of the above)

NOTE: ONE OF EACH PART ABOVE MUST BE DEFINED BY
A USE COMMAND IN ORDER TO RUN A SIMULATION
WITH THE FOLLOWING EXPECTIONS:
1. ACCESSORIES ARE NOT REQUIRED.
2. TWO CONVERTERS (drive and coast) must be specified.

*More than one of these parts may be defined.

DATA SHEET 25. ZERO



NOTE: THIS COMMAND RESETS THE ENTIRE PROGRAM TO ITS' INITIAL STATE AND ERASES ALL PARTS LOADED WITH THE USE COMMAND

APPENDIX C

```
        TITLE SIXSEV

;       WRITTEN BY J.GOODRIDGE DOT/TSC/KHL

;       CALL SIXBIT ( SIX , SEV , NBYTES )

;       CALL SIXBIT ( SIX , IBSIX , SEV , IBSEV , NBYTES )

;       CALL SEVBIT ( SIX , SEV , NBYTES )

;       CALL SEVBIT ( SIX , IBSIX , SEV , IBSEV , NBYTES )

;               SIX - STARTING ADDRESS(FIRST WORD) OF ARRAY CONTAINING
;                     SIXBIT WORD(S).

;               SEV - STARTING ADDRESS(FIRST WORD) OF ARRAY CONTAINING
;                     SEVEN BIT(ASCII) WORD(S).

;               IBSIX & IBSEV - STARTING BYTE NUMBER OF STRING TO BE
;                               USED FOR INPUT/OUTPUT. WHEN CALL HAS 3
;                               ARGUMENTS 1 IS ASSUMED FOR IBSIX & IBSEV.

;               NBYTES - NUMBER OF BYTES(CHARACTERS) IN THE INPUT ARRAY.

;       CALLING THE SIXBIT ENTRY POINT TELLS SIXSEV TO CONVERT ASCII TO
;               SIXBIT, AND THAT SEV IS THE INPUT ADDRESS AND SIX THE
;               OUTPUT ADDRESS. CALLING THE SEVBIT ENTRY POINT TELLS
;               SIXSEV THE OPPISITE.

;       THE USER SHOULD KEEP IN MIND THE FOLLOWING POINTS:

;               1) THE SIZE OF THE NEEDED OUTPUT ARRAY WHEN CALLING SEVBIT,
;                       AS MORE OUTPUT WORDS ARE GENERATED THEN INPUT WORDS
;                       DUE TO THE DIFFERENT NUMBER OF CHAR'S/WORD

;               2) THE INPUT ARRAY IS UNCHANGED.

;               3) IN THE OUTPUT ARRAY ONLY ENOUGH WORDS ARE CHANGED TO
;                       ACCOMADATE THE CONVERTED INPUT ARRAY. ANY UNUSED
;                       BYTES IN A WORD AND ANY UNUSED WORDS ARE UNCHANGED.

;               4) WHEN GOING FROM SEVEN TO SIX BITS THE SAME STRING CAN BE
;                       USED FOR OUTPUT AS INPUT, OR ANY SUCH ARRANGEMENT
;                       THAT DOES NOT CAUSE THE OUTPUT TO OVER WRITE THE INPUT
;                       BYTES.
;       ENTRY POINTS:   SEVBIT,SIXBIT

;       SUBROUTINES CALLED:     BYTPTR

;       CALLED BY:      CHKAC

APPENDIX D

Updated Nomenclature

Updated Nomenclature

AASE - required acceleration for a constant acceleration segment

ACCEL - the current acceleration at the wheels

ACCS - accessory speed table array

ACCSR - accessory array of speed ratios

ACOM - accessory comment array

ADSE - terminal distance specified as a relative segment end point

AIAS - accessory input inertia array

AIGIN - gear input inertia

AIGOUT - gear output inertia

AIP - propshaft inertia

AIW - wheel inertia

AI1 - torque converter pump inertia

AI2 - torque converter turbine inertia

AK - instantaneous torque converter capacity factor used in converter routine

AKC - coast converter input speed array

AKD - drive converter capacity factor array

ANAME - accessory name

APCS - passing clearance defining the current segment end

APOS - absolute milepost defining the current segment end

APWO - constant percent wide open throttle required for entire segment

AREA - vehicle frontal area

ARRIVE - logical flag indicating arrival at a request

ASEG - array of constant accelerations required by driving segments

ATHOLD - array of arrival accelerations for accelerate to and hold throttle driving segments

ATHR - maximum rate of change for throttle for current driving segment

ATSE - specified duration time limit for ending current driving segment

AVEL - constant velocity to be held for entire length of current driving segment

AVSE - terminal velocity defining the end of the current driving segment

AXCOM - array of axle comment

BORE - engine bore size

BPER - current slope in percent of grade being used

BVG - bevel gear ratio;

BVGEFF - bevel gear efficiency

CAC - accessory loss accumulator

CAE - aerodynamic drag loss accumulator

CBR - brake loss accumulator

CCOM - torque converter comment array

CD - vehicle drag coefficient

CDA - distance driven during acceleration

CDC - drag coefficient wind angle sensitivity factor

CDCR - distance driven during cruise

CDD - distance driven during deceleration

CDI - distance driven during idle

CDIAM - torque converter diameter

CEA - engine energy used during acceleration

CECR - engine energy used during cruise

CED - engine energy used during deceleration

CEI - engine energy used during idle

CFA - fuel consumed during acceleration

CFB - fuel consumed during braking

CFCR - fuel consumed during cruise

CFD - fuel consumed during deceleration

CFI - fuel consumed during idle

CNAME - converter name

COAST - logical flag indicating drive or coast condition to select converter

CONTOR - constant input torque - torque converter

CTA - time spent in acceleration

CTCR - time spent in cruise

CTD - time spent in deceleration

CTI - time spent in idle

CTR - torque converter loss accumulator

CUMD - cumulative distance travelled

CUMEN - cumulative engine energy expended

CUMENM - cumulative energy lost in return to engine during coast

CUMFE - cumulative fuel economy (MPG)

COMFU - cumulative weight of fuel consumed (LBS)

CUMG - cumulative gallons of fuel consumed

CUMT - cumulative time elapsed

CYL - number of cylinders in the engine (also, ICYL)

D - distance travelled in feet during current time step

DACC - variable used to alter acceleration of vehicle during an iteration

DCOM - driving schedule comment array

DDIS - distance travelled in miles during current time step

DEFDT - the default time step to be used

DEN - incremental engine energy produced during time step

DETPT - detent override shift point array

DETRPM - detent override shift speed point

DFU - incremental fuel consumed during time step

DHR - length of time step in hours

DISP - engine displacement (CID)

DNAME - driving schedule name

DNUMG - number of gears in shift logic

DRPMW - delta rpm wheels

DRPME - delta rpm engine

DSAVE - distance travelled during a gear shift step

DSEG - array of relative distance end prints for the driving segment

DSTART - start absolute distance at the beginning of a driving segment

DT - length of time step in seconds

ECOM - engine comment array

EINER - engine inertia

EMAP - engine map containing torques, fuel rates, manifold vacuums, and throttle settings for both engines

ENAME - engine name

ENDLIM - logical flag indicating print limited to last time step in each driving segment

ENDRSG - logical flag indicating the end of a route segment

ENDRTE - logical flag indicating the end of an entire route

ENDSEG - logical flag indicating the end of a driving cycle segment

ENMIN - minimum engine speed as input

ERAR - array of efficiencies of the rear axles.

ERAT - array of gear efficiencies

ERPM - engine map speed point array

FACCEL - force at the wheels dur to acceleration

FAERO - force at the wheels due to aerodynamic drag

FGRADE - force at the wheels due road grade

FRATE - fuel flow rate for current time step

FRC1
FRC2 - tire rolling resistance

FRC4 - wheel bearing friction

FROLL - force at the wheels due to rolling resistance

FSPGR - fuel specific gravity

FWHEEL - total force at wheels after tire slip accounted for

GCOM - gear comment array

GEANAM - array of gear names

GEANUM - array of gear numbers

GRAT - array of gear ratios

GRTORG - array of gear torque values for spin losses

HIPNAM - name tag of debug routine

HPA - horsepower lost to accessories

HPBR - horsepower lost to brakes

HPE - horsepower produced by engine

HPMI - total horsepower hours/mile for entire driving cycle

HPP - horsepower between differential and gear box

HPW - horsepower delivered at the wheel

HP1 - horsepower on bevel gear side of torque converter

HP2 - horsepower on gearbox side of torque converter

IAF - array of axle numbers to shift "from"

IAT - array of axle numbers to shift "to"

IENG - index indicating which engine being used

IERRE - error flag in engine routine

IGF - array of gear numbers to shift "from"

IGT - array of gear numbers to shift "to"

IPRNT - index indicating what component to print or use in disk routine

IMAX - maximum engine speeds on engine map

IMIN - minimum engine speeds on engine map

ISEG - the current segment number being executed

ITS - the current segment type being executed

ITYSEG - array of segment types for driving cycles

JENG - array of engine numbers, one assigned for each gear

LBRAKE - logical flag indicating whether or not brake is applied

LDIES - logical flag indicating diesel engine

LIMPRN - logical flag indicating whether or not limited print is desired

LLSH - logical flag indicating whether to hold a constant gear or examine shift logic during current driving segment

LRPM

LSCALE - logical flag indicating whether engine needs to be scaled

LSHFT - logical flag indicating whether or not a gear shift is required

LSTRTE - logical flag indicating last route segment

LWOT - logical flag indicating whether or not to return only maximum and minimum throttle settings from engine routine

MAPOX - integer flag indicating whether or not a gear shift is required

MILIM - logical flag indicating a limited printout every so many miles

NACC - number of accessories being used

NAXS - number of rear axle speeds

NCYCLE - number of cycles of the engine type being used

NGEAR - number of gear being used during current time step

NGOCAL - number of iterations through GOBACK routine

NGRLSS - array containing the number of points for gear spin losses for each gear.

NGSEG - array of constant gears used during driving cycle (if any)

NGT -

NGTR - number of gears

NNA - array containing the number of data prints for all accessories

NNGS - constant gear setting for a driving segment

NRAX - number of rear axles

NRDIST - total number of route segments in the route being used

NRPM - array containing number of speed points in each engine map

NRTSEG - current number of the route segment being executed

NSEG - total number of segments in the driving cycle

NSPTS - array containing number of data points in each shift line

NTBP - index of the data values where the torque converter break point exists

NTOR - array containing the number of torque points for each speed point on the engine map

NTORP -

NUMBSL - number of gear shift lines

NUMG - total number of gears being used by the transmission

PCSEG - array containing passing clearances (if any) for driving cycle segments

PCTHR - percent engine wide-open throttle

PCTWOT - percent wide-open throttle

POSTSEG - array of absolute distance mileposts (if any) for ending driving cycle segments

PPHPHR - total fuel lbs./HP-hr. used during the entire driving cycle

PWOT - array of constant parent WOT - driving schedule

RAR - array containing rear axle ratios

RCOEF - array of road coefficients for the route segments

RCOM - route comment array

RDIST - array of lengths for the route segments

RDLD - road load

RERAT - array of shift curve values

RGRADE - array of grades for the route segments

RNAME - route name

ROADC - current road coefficient used during time step

RPMAX - maximum engine speed given by map

RPME - engine speed during current time step

RPMED - engine speed during previous time step

RPMIN - minimum engine speed given by map

RPMP - propshaft speed

RPMW - wheel speed during current time step

RPMWO - wheel speed during previous time step

RPM1 - speed on engine side of torque converter

RPMW - wheel speed during current time step

RPMWO - wheel speed during previous time step

RPM1 - speed on engine side of torque converter

RPM2 - speed on gear box side of torque converter

RVWIND - array of wind values for route segment

SATH - arrival acceleration for an accelerate and hold throttle driving segment

SCOM - shift logic comment array

SECLIM - logical flag indicating that print is to be limited to every so many seconds

SHFTIME - array of shift times for shift lines

SHFTPT - array of shift points for shift lines

SHFTRPM - array of shift speeds for shift lines

SNAME - shift logic name

SOUT - array of output speeds for torque converter

SPIDLE - engine idle speed

SPIN - array of input speeds for torque converter

SR - speed ratio for current time step

SRC - array of speed ratios for the coast converter

SRD - array of speed ratios for the drive converter

STIME - shift time during the current shift being performed

STROKE - engine stroke size

T - end elapsed time in seconds of the current driving segment

TCOM - tire comment array

TEND - relative end time of current time step if a constant velocity driving segment is being executed

THR - throttle setting in degrees for this time step

THRATE - array of maximum rates of change of throttle settings for driving segments

THRMAX - maximum throttle setting on engine map

THRMIN - minimum throttle setting on engine map

TIN - array of input torques for torque converter

TIREFF - tire efficiency

TITLE - run title input by user

TMIN - minimum throttle setting for current time step engine speed

TNAME - transmission gear name

TOLD - elapsed time at beginning of current time step

TORBPK - the capacity factor value at the drive converter torque break point

TORQA - total torque needed by the accessories during current time step

TORQE - required engine torque during current time step

TORQF - torque of front end

TORQP - propshaft torque during current time step

TORQ1 - torque on engine side of torque converter during current time step

TORQ2 - torque on gear box side of torque converter during current time step

TOUT - array of output torques for torque converter

TR - torque ratio used during current time step

TRCOM - transmission data comment array

TRD - array of torque ratios for the drive converter

TRR - torque at rear end

TSAVE - time spent initializing current driving segment

TSEG - array of relative end point times for driving segments

TSTART - relative start time of current time step

TWOT - wide open throttle torque for current engine speed setting

TYPE - name of command read in input routine

UN - component name on input data card

UT - component type on input data card

V - vehicle velocity at end of current time step

VAC - engine manifold vacuum during current time step

VARNAME - name of single variable value to be modified without reading a new component from the disk

VAVG - average vehicle velocity over the entire driving cycle

VCOM - vehicle comment array

VELSEG - array of constant velocities to be used for driving segments

VNAME - vehicle name

VOLD - absolute velocity at the beginning of the current time step

VSEG - array of velocity end points for the driving segment

VSTART - relative velocity since beginning of current time step

VWIND - absolute wind velocity

WGT - vehicle weight (lbs)

WLSG - number of wheels

WRAD - wheel radius
