## Executive Summary

In this study we analyze the effectiveness of an experimental Dynamic Speed Monitoring (DSM) system that was developed and installed in the summer of 2007 at the southbound entry loop ramp at the US 27/ US 192 trumpet interchange in Polk County, Florida. The analysis aimed at assessing the effect of installing the DSM system, both on the long and short terms, on vehicles' approach speed, at a point 250 feet in advance of the southbound entry ramp curve (also the detection zone of the DSM system radar). Vehicular speeds were recorded at different time intervals, including before and after the DSM installation.

Short term results showed that after the DSM installation there was a significant average speed reduction of 3.58 mph and an increase in speed compliance of $22.27 \%$.

The long term data (insufficient period) has shown a continued average speed reduction of 2.31 mph , and, perhaps more importantly a continued reduction in the number of vehicles traveling well past the cautionary speed limit (6.8\%).

It is important to note that the district has made some improvements to the curve during the long term evaluation period which upsets the analysis, as it makes it impossible to isolate the contributions of those improvements on the DSM system performance. Such may render the results inconclusive and warrant further additional long term studies. Hence, it is strongly recommended that a long term study for much longer duration (9 months at least) be conducted. Such study would render higher confidence in measuring the long term effect.

## Chapter 1: Introduction

In this study we analyze the effectiveness of a Solar-based Dynamic Speed Monitoring (DSM) systems that was developed and installed in the summer of 2007 at the southbound entry loop ramp at the US 27/ US 192 trumpet interchange in Polk County, Florida. There has been a relatively high incidence of accidents at that site. The geometry of the southbound entry ramp coupled with high approach speeds are two of the contributing factors.

It is believed that the DSM system may lead to an overall reduction in approach speed and increase in percentage of speed limit compliance, which can possibly lower the frequency of vehicular offtracking.

The analysis, which is aimed at assessing the effect of installing the DSM, included the collection of approach speed data, at a point 250 feet in advance of the southbound entry ramp curve (also the detection zone of the DSM system radar). The approach speed data was gathered at different points in time. Such data was to be compared with the first set of data that was collected during the months of May and June 2007, before the use of the DSM system. The second set of data was collected in July 2007, after the DSM system has been put in use. A third set of data was collected 6 months later, in January 2008, to monitor the long term effect of the DSM system.

In this report we are analyzing all speed data sets: before and after installing the DSM system for the short term, and the long term. To have a more accurate indication of a possible change in vehicular behavior detailed analyses were performed that consider daytime/nighttime, weekdays/weekends, rain effect, and others. For each analysis, hypothesis tests were performed that include significant differences in the mean speed, variance, percentage of vehicles obeying the advisory sign, percentage of vehicles obeying 5 miles above the advisory sign, and the percentage of vehicles obeying 10 miles above the advisory sign.

## Chapter 2: Approach Speed Analysis for the Entire Data Set

Table 1 presents before and after long term data and statistical parameters for the approach speeds for the entire data set. Table 3 and Table 4 present the summary of the hypothesis test results.

The data reveal that the average speed decreased by 3.58 mph , the variance by 3.34 and the speed limit compliance increased by 22.27 \% after installing the DSM system. The long term data show that, 6 months following the use of DSM system, the average speed went down by a further 2.31 mph and the speed limit compliance increased by a further $6.80 \%$. However, the variance seems to have significantly increased. Figure 1 provides a frequency graph for different speed bins and Figure 2 provides the cumulative frequency. The $85^{\text {th }}$ percentile speed has been reduced by 4 mph after the use of the DSM system and has been reduced by another 4 mph on the long term.

In order to mitigate the effect of external factors, for before and after data analysis, days including rainfall have been isolated and replaced by other similar days of the week with no rainfall. Historical rainfall data was used by accessing the Weather Underground (1) website to identify the days with high precipitation. For the long term data no signific0ant precipitation has been documented except for the morning of January $23^{\text {rd }} 2008$. Table 2 shows that by removing that day from the calculations the results yielded no signification difference.

Figure 1: Before - After - Long Term Approach Speeds - Entire Data Set Graph

Figure 2: Before - After - Long Term Approach Speeds - Entire Data Set Cumulative Distributions
As illustrated in Figure 2, after using the DSM system there was a general shift in the proportion for vehicles from higher to lower speed bins (speed ranges). The long term data show a further general shift to even lower speed bins.

## Chapter 3: Approach Speed Analysis for Daytime and Nighttime Data

Similar analysis was performed but by differentiating the daylight conditions and night effect on the data. Table 5 presents before, after and long term data and statistical parameters for the approach speeds including separate daytime and nighttime data sets. Table 6 and Table 7 present the summary of the hypothesis tests results. The data reveal that the average speed decreased by 3.56 mph during daytime and 3.64 mph during nighttime, while the speed limit compliance increased by $23.60 \%$ and $19.67 \%$ after for daytime and nighttime respectively after installing the DSM system. The long term data show that, 6 months following the use of DSM system, the average speed went down by 1.00 mph during daytime and 2.32 mph during the nighttime, while the speed limit compliance increased by $3.79 \%$ for the daytime and $5.38 \%$ for the nighttime. The long term drop in compliance was less on the long term. However, there is no evidence that the compliance level is reverting back to initial conditions. The variance seems to have significantly decreased immediately after the use of the DSM system but it increased again on the long term. Figure 3 provides a frequency graph for different speed bins and Figure 4 provides the cumulative frequency during daylight conditions, and Figures 5 and 6 are the same but for the night. The $85^{\text {th }}$ percentile speed has been consistently reduced during daylight conditions and nighttime after the use of the DSM system and on the long term.

Table 5: Before - After - Long Term Daytime and Nighttime Data Set Summary

Figure 4: Before - After - Long Term Approach Speeds - Daytime Data Set Cumulative Distributions

Figure 5: Before - After - Long Term Approach Speeds - Nighttime Data Set Graph

Figure 6: Before - After - Long Term Approach Speeds - Nighttime Data Set Cumulative Distributions
As illustrated in Figure 4 and Figure 6, after using the DSM system there was a general shift in the proportion for vehicles from higher to lower speed bins. The long term data show a further general shift to even lower speed bins, however it appears to be more significant during the nighttime.

## Chapter 4: Approach Speed Analysis for Weekdays and Weekends Data

The same analysis was performed but by differentiating the Weekdays and Weekends effect on the data. Table 1-8 presents before, after and long term data and statistical parameters for the approach speeds for the weekdays data sets and Table 9 for the weekend data sets. Table 1-10 shows that there was no major difference between the general behavior of the data between weekdays and weekends. The average speeds, speed limit compliances, and $85^{\text {th }}$ speed percentile appear to be diminishing, for both weekdays and weekends, after the use of the DSM system and decreases further more on the long term. However, similar to the prior data analysis for the entire set, the variance decreases after the use of the DSM system and increases back again on the long term (after 6 months).

Figure 7 provides a frequency graph for different speed bins and Figure 8 provides the cumulative frequency during weekdays, and Figures 9 and 10 are the same but for the weekends. There is no apparent difference in the behavior of the curves between weekdays and weekends.

Table 8: Before - After - Long Term for Weekdays Data Set Summary

## Chapter 5: Average speed for every hour of the day

As shown in Tables 11 and 12, the average speeds for every hour of the day have been analyzed for the entire long term data set. The data analysis has been considered for weekdays and weekends. The plots illustrated in Figure 10 show that the average speeds were at a peak during the hours of 2pm to 4 pm and at their lowest during the hours of 7 pm to 8 pm . Figure 11 shows that the overall average speeds on weekends tend to be higher then the general data, whereas on the Weekdays they tend to be lower.

Table 11: Average Speed for Each Hour of the Day for Long Term Data Set (a)

|  | Hours of the Day | hr-0 | $\mathrm{hr}-1$ | hr-2 | hr-3 | hr-4 | hr-5 | hr-6 | hr-7 | hr-8 | hr-9 | hr-10 | hr -11 | hr-12 |

Figure 11: Average Speed for Each Hour of the Day for Long Term Data Set

Figure 12: Average Speed for Each Hour of the Day for Long Term Data Set Including Weekdays and Weekends

## Chapter 6: Conclusion

The analyses for the approach speeds before, after and on the long term have been performed for various data sets including the entire data set, daytime/nighttime and weekdays/weekends. Most of the results show that the average speeds, speed limit compliances, and $85^{\text {th }}$ speed percentile diminish after the use of the DSM system and decrease further more on the long term. However, the variances appeared to decrease after the use of the DSM system and increase back again on the long term (after 6 months). The root cause for that may be the fact that only 10 days worth of data where available for long term analysis. In addition, construction/maintenance work may have taken place during some of those days. From the data analyses we can say that, in general, there is no evidence that the average speeds, speed limit compliances, or the $85^{\text {th }}$ speed percentile have increased or returned to the original status before installing the DSM system.

For reasons cited above - short duration (10 days data) and improvements introduced, it is strongly recommended that a long term study for much longer duration (9 months at least) be conducted. Such study would render higher confidence in measuring the long term effect. If proven effective, such solar powered systems can be propagated throughout the State for similar operational characteristics.

If a longer-term study is approved as proposed in the paragraph above, the researchers propose that data collection proceed as follows:

1. Collect and analyze speed data while sign is bagged to determine if average and approach speeds are affected when the sign is not operational.
2. Collect and analyze long term speed data to confirm earlier findings under consistent operational conditions.
3. Select and deploy equipment that is on the State's approved APL list. This will enable the FDOT the immediate deployment of the DSM system once results proved valuable.

## APPENDIX

## Detailed Hypothesis Analysis

## HYPOTHESIS TEST FOR A DIFFERENCE IN MEANS - APPROACH SPEED DATA

To determine if the mean speed decreased after DSM installation (short term).

$$
\text { Ho: } \operatorname{Mean}_{(\text {before })}-\operatorname{Mean}_{(\text {after })}=0 \quad \text { Ha: } \operatorname{Mean}_{(\text {before })}-\operatorname{Mean}_{(\text {after })}>0
$$

Reject Ho if $t$ test statistic > Critical statistic; 95\% significance level

## 1. Difference in Means - Entire Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 38,515 | $\mathrm{N}_{\text {(After) }}=\quad 40,820$ |  |
| :---: | :---: | :---: | :---: |
| Mean Before = | 54.631 | Mean After = | 51.049 |
| Variance Before = | 41.286 | Variance After = | 37.949 |
| t test Statistic = | 80.066 | Deg. of Free, ט = | 78545 |
| Critical Statistic = | 1.645 |  |  |

Hence: Reject Ho - Conclude Mean Speed Reduction is Significant

## 2. Difference in Means - Daytime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 25,860 | $\mathrm{N}_{\text {(After) }}=$ | 27,636 |  |
| :---: | :---: | :---: | :---: | :---: |
| Mean Before = | 55.060 | Mean After |  | 51.496 |
| Variance Before = | 41.406 | Variance After |  | 36.534 |
| t test Statistic | 65.924 | Deg. of Free, ט | $=$ | 52621 |
| Critical Statistic = | 1.645 |  |  |  |

Hence: Reject Ho - Conclude Mean Speed Reduction is Significant

## 3. Difference in Means - Nighttime Approach Data Set

| $\mathrm{N}_{(\text {Before })}=$ |  | $\mathrm{N}_{(\text {After })}=$ | 13,184 |
| :--- | :--- | :--- | :--- |
| Mean Before $=$ | 53.753 | Mean After $=$ | 50.11 |
| Variance Before $=$ | 39.895 | Variance After $=$ | 39.62 |
|  |  |  |  |
| test Statistic $=$ | 46.416 | Deg. of Free, v $=$ | 25786 |
| Critical Statistic $=$ | 1.645 |  |  |

Hence: Reject Ho - Conclude Mean Speed Reduction is Significant

To determine if the mean speed decreased after DSM installation in the (long term).

$$
\text { Ho: } \operatorname{Mean}_{\text {(before) }}-\operatorname{Mean}_{(\text {after })}=0 \quad \text { Ha: } \operatorname{Mean}_{(\text {before })}-\operatorname{Mean}_{\text {(after) }}>0
$$

Reject Ho if $t$ test statistic > Critical statistic; 95\% significance level

## 1. Difference in Means - Entire Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 40,820 | $\mathrm{N}_{\text {(After) }}=\quad 7,018$ |  |
| :---: | :---: | :---: | :---: |
| Mean Before = | 51.049 | Mean After = | 48.740 |
| Variance Before $=$ | 37.949 | Variance After = | 51.620 |
| t test Statistic = | 25.363 | Deg. of Free, ט = | 8879 |
| Critical Statistic = | 1.645 |  |  |

Hence: Reject Ho - Conclude Mean Speed Reduction is Significant

## 2. Difference in Means - Daytime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 27,636 | $\mathrm{~N}_{(\text {After })}=$ | 2,461 |
| :--- | :--- | :--- | :--- |
| Mean Before $=$ | 51.496 | Mean After $=$ | 50.500 |
| Variance Before $=$ | 36.534 | Variance After $=$ | 41.650 |
|  |  |  |  |
| t test Statistic $=$ | 7.374 | Deg. of Free, $v=$ | 2858 |
| Critical Statistic $=$ | 1.645 |  |  |

Hence: Reject Ho - Conclude Mean Speed Reduction is Significant

## 3. Difference in Means - Nighttime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 13,184 | $\mathrm{N}_{(\text {After })}=\quad 4,557$ |  |
| :---: | :---: | :---: | :---: |
| Mean Before = | 50.111 | Mean After = | 47.79 |
| Variance Before = | 39.618 | Variance After = | 54.95 |
| t test Statistic = | 18.908 | Deg. of Free, ט = | 6960 |
| Critical Statistic = | 1.645 |  |  |

Hence: Reject Ho - Conclude Mean Speed Reduction is Significant

## HYPOTHESIS TEST FOR A DIFFERENCE IN VARIANCE - APPROACH SPEED DATA

To determine if the speed variance decreased after DSM installation (short term).

Ho: Variance $_{(\text {before })}-$ Variance $_{(\text {after }}=0 \quad H a:$ Variance $_{(\text {before })}-$ Variance $_{(\text {after }}>0$
Reject Ho if Fstatistic > Critical statistic; 95\% significance level

## 1. Difference in Variance - Entire Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 38,515 | 41.286 | $\mathrm{N}_{(\text {After })}$ <br> Variance After $=$ |
| :--- | :--- | :--- | :--- |
| Variance Before $=$ | 1.088 | Deg. of Free 1, ${ }_{1} \mathrm{O}=$ | 37.949 |
| F Statistic $=$ | 1.00 | Deg. of Free 2, ${ }_{2} \mathrm{O}=$ | 38514 |
| Critical Statistic $=$ |  | 40819 |  |

Hence: Reject Ho - Conclude Speed Variance Reduction is Significant

## 2. Difference in Variance - Daytime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 25,860 |  | $\mathrm{N}_{\text {(After) }}=\quad 27,63$ |  |
| :---: | :---: | :---: | :---: | :---: |
| Variance Before |  | 41.406 | Variance After $=$ | 36.534 |
| F Statistic | $=$ | 1.133 | Deg. of Free 1, $0=$ | 25859 |
| Critical Statistic | $=$ | 1.00 | Deg. of Free 2, $20=$ | 27635 |

Hence: Reject Ho - Conclude Speed Variance Reduction is Significant

## 3. Difference in Variance - Nighttime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 12,655 |  | $\mathrm{N}_{\text {(After) }}=13$ |  |
| :---: | :---: | :---: | :---: | :---: |
| Variance Before |  | 39.895 | Variance After $=$ | 39.618 |
| F Statistic | $=$ | 1.007 | Deg. of Free 1, $10=$ | 12654 |
| Critical Statistic | $=$ | 1.00 | Deg. of Free 2, $20=$ | 13183 |

To determine if the speed variance decreased after DSM installation (long term).

Ho: Variance $_{(\text {before })}-$ Variance $_{(\text {after })}=0 \quad$ Ha: Variance $_{(\text {before })}-$ Variance $_{(\text {after }}>0$
Reject Ho if Fstatistic > Critical statistic; 95\% significance level

## 1. Difference in Variance - Entire Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=1040,820$ |  | $\mathrm{N}_{\text {(After) }}=\quad 7,018$ |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Variance Before $=$ | 37.949 | Variance After = | 51.620 | Variance actually increased |

Hence: Accept Ho - Conclude Speed Variance Reduction is not Significant

## HYPOTHESIS TEST FOR A DIFFERENCE IN PROPORTIONS - APPROACH SPEED DATA COMPLIANCE WITH SPEED LIMIT - 55 MPH

To determine if the proportion of drivers complying with the speed limit of 55 mph increased after DSM Installation (short term).

```
Ho: Proportion(before) - Proportion
Ha: Proportion(before)}\mp@subsup{|}{\mathrm{ - Proportion (atter)}}{<0
```

Reject Ho if Z statistic test < Critical statistic; 95\% significance level

## 1. Difference in Proportions - Entire Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 38,515 | $\mathrm{N}_{\text {(After) }}=$ | 40,820 |
| :---: | :---: | :---: | :---: |
| Proportion Before $=$ | 0.559 | Proportion After $=$ | 0.782 |
| Z test Statistic = | -66.87 | p(pooled) | 0.674 |
| Critical Statistic = | -1.645 | q(pooled) | 0.326 |

Hence: Reject Ho - Conclude 55 mph Advisory Speed Compliance is increased

## 2. Difference in Proportions - Daytime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 25,860 | $\mathrm{N}_{\text {(After) }}=$ | 27,636 |
| :---: | :---: | :---: | :---: |
| Proportion Before $=$ | 0.527 | Proportion After $=$ | 0.763 |
| Z test Statistic = | -57.11 | p(pooled) | 0.649 |
| Critical Statistic = | -1.645 | q(pooled) | 0.351 |

Hence: Reject Ho - Conclude 55 mph Advisory Speed Compliance is increased

## 3. Difference in Proportions - Nighttime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 12,655 | $\mathrm{N}_{\text {(After) }}=$ | 13,184 |
| :---: | :---: | :---: | :---: |
| Proportion Before $=$ | 0.627 | Proportion After = | 0.823 |
| Z test Statistic = | -35.47 | p(pooled) | 0.727 |
| Critical Statistic = | -1.645 | q(pooled) | 0.273 |

Hence: Reject Ho - Conclude 55 mph Advisory Speed Compliance is increased

To determine if the proportion of drivers complying with the speed limit of 55 mph increased after DSM Installation (long term).

Ho: Proportion $_{(\text {before })}-$ Proportion $_{(\text {after })}=0$
Ha: Proportion $_{\text {(before) }}-$ Proportion $_{(\text {after })}<0$
Reject Ho if $Z$ statistic test < Critical statistic; 95\% significance level

## 1. Difference in Proportions - Entire Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 40,820 | $\mathrm{N}_{\text {(After) }}=$ | 7,018 |
| :---: | :---: | :---: | :---: |
| Proportion Before $=$ | 0.782 | Proportion After $=$ | 0.850 |
| Z test Statistic = | -12.97 | p(pooled) | 0.792 |
| Critical Statistic = | -1.645 | q(pooled) | 0.208 |

Hence: Reject Ho - Conclude 55 mph Advisory Speed Compliance is increased

## 2. Difference in Proportions - Daytime Approach Data Set

| $\mathrm{N}_{(\text {Before })}=$ | 27,636 | $\mathrm{~N}_{\text {(After) }}=$ |  | 2,461 |
| :--- | :--- | :--- | :--- | :--- |
| Proportion Before $=$ | 0.763 | Proportion After | $=$ |  |
| Z test Statistic $=$ | -4.26 | p(pooled) | $=$ | 0.800 |
| Critical Statistic $=$ | -1.645 | $q($ pooled $)$ | $=$ | 0.766 |
|  |  |  | 0.234 |  |

Hence: Reject Ho - Conclude 55 mph Advisory Speed Compliance is increased

## 3. Difference in Proportions - Nighttime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 13,184 | $\mathrm{N}_{\text {(After) }}=$ | 4,557 |
| :---: | :---: | :---: | :---: |
| Proportion Before $=$ | 0.823 | Proportion After $=$ | 0.877 |
| Z test Statistic = | -8.48 | p(pooled) | 0.837 |
| Critical Statistic = | -1.645 | q(pooled) | 0.163 |

Hence: Reject Ho - Conclude 55 mph Advisory Speed Compliance is increased

## HYPOTHESIS TEST FOR A DIFFERENCE IN PROPORTIONS - APPROACH SPEED DATA COMPLIANCE WITH SPEED LIMIT + 5 MPH

To determine if the proportion of drivers complying with the speed limit of $55 \mathrm{mph}+5 \mathrm{mph}$ increased after DSM installation (short term).

```
Ho: Proportion \(_{\text {(before) }}-\) Proportion \(_{(\text {after })}=0\)
Ha: Proportion \(_{\text {(before) }}-\) Proportion \(_{(\text {after })}<0\)
```

Reject Ho if Z test statistic < Critical statistic; 95\% significance level

## 1. Difference in Proportions - Entire Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 38,515 | $\mathrm{N}_{\text {(After) }}=$ | 40,820 |  |
| :---: | :---: | :---: | :---: | :---: |
| Proportion Before $=$ | 0.837 | Proportion |  | 0.944 |
| Z test Statistic | -48.61 | p(pooled) | = | 0.892 |
| Critical Statistic = | -1.645 | q(pooled) | = | 0.108 |

Hence: Reject Ho - Conclude $55+5 \mathrm{mph}$ Speed Compliance is increased

## 2. Difference in Proportions - Daytime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=\quad 25,860$ | 25,860 | $\mathrm{N}_{\text {(After) }}=$ | 27,636 |  |
| :---: | :---: | :---: | :---: | :---: |
| Proportion Before $=$ | 0.819 | Proportion |  | 0.939 |
| Z test Statistic = | -42.91 | p(pooled) | = | 0.881 |
| Critical Statistic = | -1.645 | q(pooled) | = | 0.119 |

Hence: Reject Ho - Conclude $55+5 \mathrm{mph}$ Speed Compliance is increased

## 3. Difference in Proportions - Nighttime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 12,655 | $\mathrm{N}_{\text {(After) }}=$ | 13,184 |  |
| :---: | :---: | :---: | :---: | :---: |
| Proportion Before $=$ | 0.876 | Proportion |  | 0.956 |
| Z test Statistic | -23.27 | p(pooled) | = | 0.917 |
| Critical Statistic | -1.645 | q(pooled) | = | 0.083 |

Hence: Reject Ho - Conclude $55+5 \mathrm{mph}$ Speed Compliance is increased

To determine if the proportion of drivers complying with the speed limit of $55 \mathrm{mph}+5 \mathrm{mph}$ increased after DSM installation (long term).

Ho: Proportion $_{\text {(before) }}-$ Proportion $_{(\text {after })}=0 \quad$ Ha: Proportion $_{(\text {before })}-$ Proportion $_{(\text {after })}<0$
Reject Ho if Z test statistic < Critical statistic; 95\% significance level

## 1. Difference in Proportions - Entire Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=\quad 40,820$ | 40,820 | $\mathrm{N}_{\text {(After) }}=$ | 7,018 |  |
| :---: | :---: | :---: | :---: | :---: |
| Proportion Before $=$ | 0.944 | Proportion After | $=$ | 0.964 |
| Z test Statistic = | -6.72 | p(pooled) | = | 0.947 |
| Critical Statistic = | -1.645 | q(pooled) |  | 0.053 |

Hence: Reject Ho - Conclude 55 + 5 mph Speed Compliance is increased

## 2. Difference in Proportions - Daytime Approach Data Set

$\left.\begin{array}{lllll}\mathrm{N}_{(\text {Before })}= & 27,636 & 0.939 & \begin{array}{l}\mathrm{N}_{(\text {After })}= \\ \text { Proportion After }\end{array} & =2,461\end{array}\right)$

Hence: Reject Ho - Conclude $55+5 \mathrm{mph}$ Speed Compliance is increased

## 3. Difference in Proportions - Nighttime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 13,184 | 0.956 | $\mathrm{~N}_{\text {(After) }}=$ | 4,557 |
| :--- | :--- | :--- | :--- | :--- |
| Proportion Before $=$ |  | Proportion After | $=$ | 0.972 |
| Z test Statistic $=$ | -4.75 | $\mathrm{p}($ pooled $)$ | $=$ | 0.960 |
| Critical Statistic $=$ | -1.645 | $\mathrm{q}($ pooled $)$ | $=$ | 0.040 |

Hence: Reject Ho - Conclude 55 + 5 mph Speed Compliance is increased

# HYPOTHESIS TEST FOR A DIFFERENCE IN PROPORTIONS - APPROACH SPEED DATA COMPLIANCE WITH SPEED LIMIT + 10 MPH 

To determine if the proportion of drivers complying with the speed limit of $55 \mathrm{mph}+10 \mathrm{mph}$ increased after DSM installation in the short term.

Ho: Proportion $_{(\text {before })}-$ Proportion $_{(\text {after })}=0 \quad$ Ha: Proportion $_{(\text {before })}-$ Proportion $_{(\text {after })}<0$
Reject Ho if Z test statistic < Critical statistic; 95\% significance level

## 1. Difference in Proportions - Entire Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 38,515 |  | $\mathrm{N}_{\text {(After) }}=$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Proportion Before $=$ |  | 0.958 | Proportion |  | 0.988 |
| Z test Statistic |  | -26.53 | p(pooled) |  | 0.974 |
| Critical Statistic |  | -1.645 | q(pooled) | = | 0.026 |

Hence: Reject Ho - Conclude $55+10$ mph Speed Compliance is increased

## 2. Difference in Proportions - Daytime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=\quad 25,860$ |  | $\mathrm{N}_{\text {(After) }}=\quad 27,636$ |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Proportion Before $=$ | 0.952 | Proportion |  | 0.987 |
| Z test Statistic = | -23.81 | p(pooled) | = | 0.970 |
| Critical Statistic = | -1.645 | q(pooled) | = | 0.030 |

Hence: Reject Ho - Conclude $55+10$ mph Speed Compliance is increased

## 3. Difference in Proportions - Nighttime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 12,655 | $\mathrm{N}_{\text {(After) }}=$ | 13,184 |  |
| :---: | :---: | :---: | :---: | :---: |
| Proportion Before $=$ | 0.970 | Proportion |  | 0.991 |
| Z test Statistic = | -11.93 | p(pooled) | = | 0.980 |
| Critical Statistic = | -1.645 | q(pooled) | = | 0.020 |

Hence: Reject Ho - Conclude $55+10$ mph Speed Compliance is increased

To determine if the proportion of drivers complying with the speed limit of $55 \mathrm{mph}+10 \mathrm{mph}$ increased after DSM installation in the long term.

Ho: Proportion $_{(\text {before })}-\operatorname{Proportion}_{(\text {after })}=0 \quad$ Ha: Proportion $_{(\text {before })}-$ Proportion $_{(\text {after })}<0$
Reject Ho if $Z$ test statistic < Critical statistic; 95\% significance level

## 1. Difference in Proportions - Entire Approach Data Set

| $\mathrm{N}_{(\text {Before })}=40,820$ |  | $\mathrm{~N}_{(\text {After })}$ | 7,018 |  |
| :--- | :--- | :--- | :--- | :--- |
| Proportion Before $=$ | 0.988 | Proportion After | $=$ | 0.989 |
| Z test Statistic $=$ | -0.48 | $\mathrm{p}($ pooled $)$ | $=$ | 0.988 |
| Critical Statistic $=$ | -1.645 | $\mathrm{q}($ pooled $)$ | $=$ | 0.012 |

Hence: Accept Ho - Conclude $55+10 \mathrm{mph}$ Speed Compliance is not increased

## 2. Difference in Proportions - Daytime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=\quad 27,636$ | 27,636 | $\mathrm{N}_{(\text {After })}=$ | 2,461 |  |
| :---: | :---: | :---: | :---: | :---: |
| Proportion Before $=$ | 0.987 | Proportion After | $=$ | 0.995 |
| Z test Statistic | -3.42 | p(pooled) | = | 0.988 |
| Critical Statistic = | -1.645 | q(pooled) |  | 0.012 |

Hence: Reject Ho - Conclude $55+10$ mph Speed Compliance is increased

## 3. Difference in Proportions - Nighttime Approach Data Set

| $\mathrm{N}_{\text {(Before) }}=$ | 13,184 | $\mathrm{N}_{\text {(After) }}=$ | 4,557 |  |
| :---: | :---: | :---: | :---: | :---: |
| Proportion Before $=$ | 0.991 | Proportion |  | 0.993 |
| Z test Statistic = | -1.54 | p(pooled) |  | 0.991 |
| Critical Statistic = | -1.645 | q(pooled) |  | 0.009 |

Hence: Accept Ho - Conclude $55+10$ mph Speed Compliance is not increased
