RESPONSIBILITIES FOR MAINTAINING THE DATA SYSTEM FOR PAVEMENT DESCRIPTIVE INFORMATION

by

Marion F. Creech
Highway Materials Research Analyst
and
Stephen N. Runkle
Highway Research Analyst

INTRODUCTION

Since March of 1971 the Research Council has had under way a project entitled "Systematizing Pavement Information for the Highways of Virginia". One of the purposes of this project was to develop a computer based data system for the collection, storage, and retrieval of pavement information which would allow efficient usage of the data, including the ability to coordinate the data with other data bases such as the ones for skid data, volume data, and accident data.

The system to handle pavement information has now been developed to the point that it is possible to turn the responsibility for maintaining it over to operating personnel.

PURPOSE

The purpose of this report is to outline the responsibilities of each division and the districts and the residencies in maintaining the Pavement Data System.

RESPONSIBILITIES

Everyone involved with the Pavement Data System has the responsibility to make a continual assessment of the system to determine if it operates as efficiently as possible and if it provides data for as many uses as possible. For instance, the Materials Division has the responsibility to consult with field personnel on matters such as design and inclusion of new mixes, special mixes, and grooving, and to help determine how these things should be included in the system. Assessment of the system would include the suggestion of revisions where they may improve it. The Maintenance Division will have the responsibility of coordinating the inclusion of beneficial revisions with the Data Processing Division.

Specific responsibilities for maintaining the system are outlined below. Figure 1 (pages 5 and 6) illustrates the flow of data in the system and thus the sequence in which the various responsibilities will occur.

Residency

1. Submit coded data with finals for maintenance and new construction, and ensure that the correct numbers of forms are submitted.
2. Review the computer printout of the latest year's data and submit corrections and/or omissions to the Maintenance Division.

District Computer

1. Furnish field personnel data forms DP20, DP20A, and DP20B, with valid four digit sequence numbers stamped in upper right-hand corner of form DP20. A supply of forms will be obtained from the printing section in the Central Office by the district computer, and his office will stamp the sequence numbers. Care should be exercised to see that the sequence numbers do not repeat during the year, since they tie the information together in the computer. The first digit of the sequence number identifies the district and the last three digits may be 001 to 999.
2. Maintain a sufficient stock of "Pavement Descriptive Information Data System Code Manuals" to keep the district personnel supplied.
3. Check to ascertain that the correct number of forms has been filed for each final estimate for construction or maintenance.
4. Answer field personnel's questions about filling out form.

District Materials Engineer

1. Check completed data code forms for accuracy of job mixes and return to district computer for mailing to the Central Office with final estimate. The primary check at this point will be for the accuracy of the job mix.
2. Check the computer printout of the latest year's data against in-place pavement for location and correctness of data and submit corrections and/or omissions to the Maintenance Division.
3. In conjunction with the Materials and Maintenance Divisions, conduct refresher schools in coding when necessary. These should be held after major revisions in the system and whenever for other reasons they are deemed necessary.

Maintenance Division

1. As mentioned previously, maintain a close assessment of the system to determine if it is functioning properly and make decisions, after

correspondence with other engineers, about revising system to make it more useable. A formal assessment of the system should be made every two years. It is anticipated that usage of the system will indicate that certain important data may have been omitted while some data not as important have been included.

2. Check the final estimates of all maintenance surfacing for inclusion of the completed data code forms and their correctness, and transfer the forms to the Data Processing Division.
3. Assign new codes as needed to complete forms and notify Data Processing Division of the new codes.
4. Revise on a yearly basis the "Pavement Descriptive Information Data System Code Manual." The manual will be revised by page and in any one year it is not anticipated that over 3 or 4 pages will need revision. One of the major revisions will be the inclusion of new quarry locations.
5. Review the latest year's data computer printout for omissions and/or corrections. Summarize all omissions and/or corrections and submit these to the Data Processing Division.
6. Assist the Data Processing Division in editing data as required.
7. Schedule schools as necessary, in conjunction with Materials Division and district materials engineer.

Construction Division

1. Check the final estimates of all construction projects for inclusion of completed data code forms and detach and transmit forms to Data Processing Division.
2. Obtain new codes as needed and complete forms prior to sending them to the Data Processing Division.
3. Review the latest year's data computer printout and submit any corrections and/or omissions to the Maintenance Division.

Data Processing Division

1. Assemble and keypunch data.
2. Edit latest year's data.
3. Provide printouts of latest year's data.
4. Update master file of pavement data.

5. Annually provide updated printouts of complete pavement information file.
6. Alter programs as required by the inclusion of new codes in the system.
7. Make revisions in the system as deemed necessary by the users to make the system more beneficial.

Also shown in Figure 1, under completion date, are the dates various tasks in the system should be completed each year. It is planned to have the system updated annually and include data for all paving work completed prior to December 1 of each year. All data should be submitted to the Data Processing Division by January 1. The data Processing Division will provide printouts of the latest year's data by February 1, and corrections and/or omissions as determined from the printouts should be submitted back to the Data Processing Division by March 1. The updated printout of the complete pavement data file will be available by April 1 of each year.

INTRODUCTION

The purpose of the data system for which this manual was prepared is to provide descriptive information about the highway system, including data describing materials used in the surface and subsurface. Information on subsurface mixes will be developed only for new construction, and not for maintenance resurfacing.

Basically the system is designed for new construction and scheduled maintenance. In the event that unscheduled maintenance which is at least one lane wide and .25 mile long should occur, a data sheet should be submitted.

The basic unit in the system will be designated as a surface mix section and will normally begin and end where a particular surface mix begins and ends. The section will be located by beginning and ending mileposts, as well as descriptive beginning and ending points. All descriptive information about a surface mix section should, of course, remain the same for the entire section. Therefore, at times, it will be necessary to break surface mix sections into smaller sections because of changes in some of the descriptive data such as highway type, special features, etc. The method of subdividing surface mix sections will be dealt with in more detail later in this manual.

In instances there may be pieces of descriptive data to be included in the system for which there is no code in the manual. For instance, a new source of aggregate may occur for which no code has been developed. When no code exists, the person recording the data should attach a note indicating what the data are, and that no code exists. The Maintenance Division will then be responsible for assigning a code for the data in question and updating the manual.

Code the district, residency, and county as indicated below.

District (card 1, column 1)

<u>District</u>	<u>Code</u>
Bristol	1
Salem	2
Lynchburg	3
Richmond	4
Suffolk	5
Fredericksburg	6
Culpeper	7
Staunton	8

Residency (card 1, columns 2-3)

<u>District</u>	<u>Residency</u>	<u>Code</u>

County (continued)

<u>County</u>	<u>Code</u>	<u>County</u>	<u>Code</u>
Richmond	79	Stafford	89
Roanoke	80	Surry	90
Rockbridge	81	Sussex	91
Rockingham	82	Tazewell	92
Russell	83	Warren	93
Scott	84	Washington	95
Shenandoah	85	Westmoreland	96
Smyth	86	Wise	97
Southampton	87	Wythe	98
Spotsylvania	88	York	99

Note: For the cities shown below use the county codes indicated.

<u>City</u>	<u>County Code</u>
Virginia Beach	75
Hampton	27
Newport News	94

Note: If a section is divided by a county line, then the section should be considered as two sections, one within each of the counties.

Route Number (card 1, columns 6-9)

Record the standard route number as shown in the graphic log. When two routes are in the same physical location, i. e., overlapping routes, record the predominate route as shown in the graphic log. The predominate route is the one for which the information is recorded in the graphic log, with blank spaces appearing in the log for the other routes.

Prefixes for special routes, such as alternate routes, should be coded in column six as shown below.

<u>Route Type</u>	<u>Code</u>
Alternate	A
Bypass	B
Commercial (business)	C
Alternate Y	Y
Z	Z

Record service roads and ramps by the main route number.

City/Town/County (card 1, columns 10-12)

If the work occurs in a city or town, record the city or town three digit code. If the work does not occur in a city or town, record the appropriate two digit county code (shown above) in the last two columns, and record zero in the first column.

<u>City/Town</u>	<u>Code</u>	<u>City/Town</u>	<u>Code</u>

Stanley	303	Williamsburg	137
Staunton	132	Winchester	138
Stephens City	304	Windsor	328
Stony Creek	305	Wise	329
Strasburg	306	Woodstock	330
Stuart	307	Wytheville	139

Note: If a section should occur both within and outside of a town, then the recording of data should be on the basis of two sections, one within the town and the other outside the town, or three sections (two outside the town) if the work begins outside one side of the town limits and ends outside the other side of the town limits. The same procedure should be used if the section is entirely within a town, but divided by a county line. The one section would then be handled as two, one within each county.

Beginning Milepost (card 1, columns 13-16)

Record the beginning milepost correct to the nearest one-hundredth as taken directly from the graphic log. Recording of the decimal point is not required.

Examples:	<u>Milepost</u>	<u>Coded Milepost</u>
	17.31	1731
	5.20	0520

Ending Milepost (card 1, columns 17-20)

Record the ending milepost as explained above for the beginning milepost.

Direction (card 1, column 21)

Direction refers to the direction of the lane or lanes for which data are being recorded.

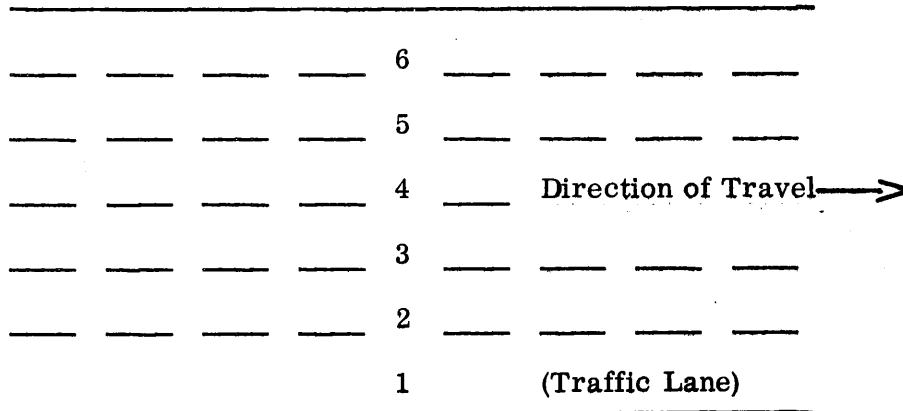

<u>Direction</u>	<u>Code</u>
North-South or East-West	0
North	1
South	2
East	3
West	4

Codes 1-4 will be used only when all lanes in both directions are not involved. See the examples shown below under Lane for the proper coding techniques for various situations.

The direction coded should refer to the normal direction for the route throughout the state which would either be a north-south route, or east-west route. The direction is indicated in the graphic log.

Lane (card 1, column 22)

When there is more than one lane of travel in any given direction, and data pertain to one of those lanes only, then code that lane as shown in the diagram below.

Code 0 if all lanes in one or both directions are described by the same information.

For express lanes code a 5 in the Direction column and the appropriate lane number in the Lane column facing away from the zero milepost (see examples 9 and 10 below).

Note: When data are different for the lanes going in opposite directions, a data sheet is required for each direction. When data are different for one lane in a given direction, a data sheet is required for each lane in that given direction for which data are recorded, even if several of the lanes are described by identical information.

	Examples	Direction	Lane(s)
1.	Dual lane, north-south highway — data pertain to both lanes. Code	0	0
2.	Four lane divided, north-south highway — data pertain to all lanes in both directions. Code	0	0
3.	Dual lane, north-south highway - data pertain to northbound lane only. Code northbound lane	1	0
4.	Four lane divided, north-south highway — data pertain to northbound lanes only. Code northbound lanes	1	0
5.	Four lane divided, north-south highway — data pertain to northbound traffic lane only. Code northbound traffic lane	1	1
6.	Four lane divided, north-south highway — data pertain to northbound traffic lane and both southbound lanes. Code northbound traffic lane Code southbound lanes	1 2	1 0
7.	Three lane, north-south highway — data pertain to all three lanes. Code	0	0
8.	Three lane, north-south highway — data pertain to northbound and center lanes only. Code northbound traffic lane Code center lane	1 0	1 2
9.	Eight lane highway with two express lanes separate in center such as Rt. 95 in Fairfax — data pertain to northbound and express lanes. Code northbound lanes Code express lanes	1 5	0 0
10.	Eight lane highway with two express lanes separate in center such as Rt. 95 in Fairfax. The zero milepost occurs at the southern county line — data pertain to southbound lanes and express lane nearest the southbound lanes. Different data pertain to the express lane nearest the northbound lanes. Code express lane nearest the three southbound lanes Code southbound lanes Code express lane nearest the three northbound lanes	5 2 5	5 0 4

Nineteen columns of space are allowed for an explanation of where a section begins. No particular format is required for this input, except that it should be referenced to the nearest intersection, corporate limits, or county line.

The list of abbreviations shown below should be used as needed. It is not necessary to include Route or its abbreviation prior to the route number.

<u>Item</u>	<u>Abbreviation</u>
North	N
South	S
East	E
West	W
North Corporate Limits	NCL
South Corporate Limits	SCL
East Corporate Limits	ECL
West Corporate Limits	WCL
County Line	CL
Miles	MI
North Intersection	NINT
South Intersection	SINT
East Intersection	EINT
West Intersection	WINT

The abbreviations NINT, SINT, EINT, and WINT will be used only if the route referenced to intersects the route the section is on more than once as shown in the diagram below.

It is not necessary to use the abbreviation for intersections when the routes in question intersect only once.

Examples: (1) Code

1	.	5		M	I		N		N	I	N	T		6	9	2		
---	---	---	--	---	---	--	---	--	---	---	---	---	--	---	---	---	--	--

for 1.5 miles north of the north intersection with Route 692.

(2) Code

3	.	8	2		M	I		N		N	C	L		C	H	A	R	L
---	---	---	---	--	---	---	--	---	--	---	---	---	--	---	---	---	---	---

for 3.82 miles north of the north corporate limits of Charlottesville.

The mileages shown in the descriptive locations should be consistent with those shown in the graphic log.

Descriptive Ending of Section (card 1, columns 42-60)

Record the descriptive ending of the section as described above for the descriptive beginning of the section.

Highway System (card 1, column 61)

Code the correct highway system as indicated below.

<u>System</u>	<u>Code</u>
Interstate	1
Arterial	2
Primary	3
Secondary	4

Highway Type Information (card 1, columns 62-63)

<u>Kind of Highway</u>	<u>Code</u>
One Way	10
Two Lane	20
Three Lane	30
Four Lane Undivided	40
Four Lane Divided -- No Control of Access	41
Four Lane Divided -- Partial Control of Access	42
Four Lane Divided -- Full Control of Access	43
Four Lane Divided -- Full Control of Access -- Two Express Lanes	45
Six Lane Undivided	60
Six Lane Divided -- No Control of Access	61
Six Lane Divided -- Partial Control of Access	62
Six Lane Divided -- Full Control of Access	63
Six Lane Divided -- Full Control of Access -- Two Express Lanes	65
Transition from a two lane (20) highway to a higher kind of highway, 30-40 etc., or transition from a higher kind of highway to a two lane (20) highway	72
Transition from a three lane (30) highway to a higher kind of highway, 40-60 etc., or transition from a higher kind of highway to a three lane (30) highway	73
Transition from a four lane (40-41-42-43) highway to a higher kind of highway, 60-61-62-63, or transition from a higher kind of highway to a four lane highway	74
(Reserved for 8 lanes)	80
Service Road Right	98
Service Road Left	99

Note: The appropriate code for any section of highway is shown in the graphic log.

Note: Whether a service road is right or left is determined by facing away from the zero milepost point for the route in question (in graphic log a right service road would be below the center of the log and a left service road would be above the center).

Note: If the highway type changes within the section defined by surface mix type, then the section as defined by surface mix type should be divided into smaller sections equal to the number of highway types within the original section.

New Construction or Maintenance (card 1, column 64)

<u>Type</u>	<u>Code</u>
New Construction	1
Maintenance	2

Maintenance construction projects should be coded as new construction.

Date of Completion (card 1, columns 65-68)

The first two columns should contain the month of completion coded as shown below. The last two columns should contain the last two digits of the year of completion.

<u>Month</u>	<u>Code</u>
January	01
February	02
March	03
April	04
May	05
June	06
July	07
August	08
September	09
October	10
November	11
December	12

Examples: <u>Date of Completion</u>	<u>Coded</u>
May 1972	0572
November 1972	1172

Specification Year (card 1, columns 69-70)

The last two digits of the specification year under which a project on schedule was let should be coded direct.

Surface Mix Type (card 1, columns 71-72)

As explained in the introduction, a section will always consist of the same surface mix type. The codes for the various mix types are shown below.

<u>Mix Type</u>	<u>Code</u>
S-1	01
S-2	02
S-3	03
S-4	04
S-5	05
S-6	06
MS-4	10
MS-5	11
MS-7	12
MS-8	13
MS-9	14
MS-10	15
I-1	20
I-2	21
I-3	22
Popcorn Mix	23
MI-2	30
MI-3	31
Portland Cement Concrete	40
Surface Treatment	41
Slurry Seal — Type A	42
Slurry Seal — Type B	43
Slurry Seal — Type C	44
Mix-in-Place	45

Special Features (card 1, columns 73-74)

When a special feature occurs which does not correspond to the beginning or ending of a section, the section should be subdivided into two or more sections.

Examples: Two sections as defined by mix type occur between mileposts 0.00 and 5.00 and 5.00 and 10.00. A special feature exists between mileposts 4.00 and 9.00. The two sections should be subdivided into four sections between mileposts 0.00 and 4.00, 4.00 and 5.00, 5.00 and 9.00, and 9.00 and 10.00.

A section as defined by mix type occurs between mileposts 10.31 and 12.52. A special feature exists between mileposts 11.00 and 11.50. The one section should be subdivided into three sections between mileposts, 10.31 and 11.00, 11.00 and 11.50, and 11.50 and 12.52.

<u>Special Feature</u>	<u>Code</u>
None	00
Grooved Pavement	01
Limestone Blend — Bituminous Concrete	02
Sprinkle Mix — Bituminous Concrete	03
Lightweight Aggregate Mix	04
Grooved Pavement — Type 2	05
Popcorn Mix	06
Petromat	07

Note: Any mix which contains a limestone aggregate will be considered a limestone blend. A Sprinkle mix obviously would contain limestone aggregates, but should be coded as a sprinkle mix (03).

Sequence Number (card 1, columns 75-78)

The sequence number, which is printed on the top right-hand corner of form DP-20, should be coded direct in columns 75 through 78 on card one.

Project Number (card 2, columns 1-15, 16-30, 31-45, 46-60)

Space is provided for the inclusion of many project sections and jobs. However, it is important to remember that all the information collected on forms DP-20 and DP-20-A must be identical for all the project sections and jobs listed. A change in any of the information recorded on DP-20 or DP-20-A, such as route number, beginning milepost, ending milepost, direction, or lane would require submission of a separate data form.

Example: For project number 0033-082-101, C501, code

PROJECT NUMBER													
Section			Job				Job				Job		
1	0	1	C	5	0	1							
1-3			4-7				8-11				12-15		

Example: For project number 0033-082-101, C501, 502, 503, code

PROJECT NUMBER														
Section			Job				Job				Job			
1	0	1	C	5	0	1	C	5	0	2	C	5	0	3
1-3			4-7				8-11				12-15			

Example: For project numbers 0033-082-101, C501
 0033-082-102, C501, 502
 0033-082-104, G501, 502
 0033-082-104, P501, 502, code

PROJECT NUMBER													
Section			Job				Job				Job		
1	0	1	C	5	0	1							
1-3			4-7				8-11				12-15		

PROJECT NUMBER													
Section			Job				Job				Job		
1	0	2	C	5	0	1	C	5	0	2			
16-18			19-22				23-26				27-30		

PROJECT NUMBER													
Section			Job				Job				Job		
1	0	4	G	5	0	1	G	5	0	2			
31-33			34-37				38-41				42-45		

PROJECT NUMBER													
Section			Job				Job				Job		
1	0	4	P	5	0	1	P	5	0	2			
46-48			49-52				53-56				57-60		

Schedule Number (card 2, columns 61-65)

For bituminous plant mix schedules, code the **five digit** schedule number direct. For instance, for schedule 801-72, code 801-72.

For surface treatment and slurry seal schedules use the following rules:

1. Code the district in column 61.
2. Code the schedule type in column 62 where
 - surface treatment schedule A = 1
 - surface treatment schedule B = 2
 - surface treatment schedule C = 3,
 - and slurry seal schedule = 4,
3. Code the schedule number for the year in column 63. For instance, the first slurry seal schedule would be coded as 1, and the second as 2.
4. Code the last two digits of the schedule year in columns 64 and 65.

Examples:	<u>Schedule</u>	<u>Code</u>
	801-72	801
	SS-1-72	141
	C-81-72	831
	C-82-72	832

For unscheduled maintenance code 000.

Sequence Number (card 2, columns 75-78)

The sequence number, which is printed on the top right-hand corner of form DP-20, should be coded direct in columns 75 through 78 on card two.

Surface Information

The next group of items refer to surface mixes only. The data input for the surface mix will change depending on whether the surface is portland cement concrete, bituminous concrete, or bituminous surface treatment.

Bituminous Concrete MixesAsphalt Type (card 3, columns 1-2)

<u>Type</u>	<u>Code</u>
AP-00	01
AP-1	02
AP-3	04
AP-5	06
CAE-2	10
AE-2	11
CAE-3	12
AE-3	13
AE-4	14
RC-2	20
RC-250	21
RC-0	22
AC-5	30
AC-10	40
AC-20	50
AC-40	60

Pounds/Square Yard of Mix Placed (card 3, columns 3-5)

The pounds per square yard of bituminous concrete placed should be recorded correct to the nearest pound as shown in the examples below:

<u>Examples:</u>	<u>Pound/Sq. Yd. Placed</u>	<u>Code</u>
	80 pounds/sq. yd.	080
	150 pounds/sq. yd.	150

Design Asphalt Content (card 3, columns 6-9)

The Job Mix design asphalt content (percent asphalt) should be recorded correct to the nearest one-hundredth as shown in the examples below. The decimal point should not be included.

Examples:	<u>Design Asphalt Content</u>	<u>Code</u>
	5.5 %	0550
	6.25%	0625
	10.0 %	1000

If the Job Mix design asphalt content changes during a project or schedule, then the average design asphalt content should be coded. For instance, if the Job Mix initially required 6.0 percent asphalt, and was changed to 6.2 percent, then 6.1 percent asphalt should be coded as 0610.

Change in Design Asphalt Content (card 3, column 10)

If the design asphalt content changes during a project or schedule, then code 1. If no change occurs code 0.

Portland Cement Concrete MixesCuring Method (card 3, column 11)

<u>Method</u>	<u>Code</u>
Liquid Membrane	1
Polyethylene	2
Curing Paper	3

Texturing Method (card 3, columns 12-13)

<u>Method</u>	<u>Code</u>
Burlap Drag - single layer, single application	01
Burlap Drag - multiple layers, multiple applications	02
Broom - natural bristle	03
Broom - wire bristle	04
Metal Tines	05

Bags Cubic Yard (card 3, columns 14-16)

Record the number of bags of cement used per cubic yard in the mix to the nearest one hundredth. Inclusion of the decimal point is not required.

<u>Examples:</u>	<u>Number of Bags Used</u>	<u>Code</u>
	3 bags cu. yd.	300
	$3\frac{1}{2}$ bags/cu yd.	350
	$3\frac{1}{4}$ bags cu yd.	325

Source of Cement (2 columns)

<u>Supplier</u>	<u>Plant Location</u>	<u>Code</u>
Alpha	Lime Kiln, Md.	01
Atlantic	Baltimore, Md.	02
	Norfolk, Va.	03

Asphalt Gallons Per Square Yard (card 3, columns 29-30)

Record the gallons per square yard of asphalt intended correct to the nearest one-hundredth gallon. Do not record the decimal point.

Examples:	<u>Gallons Per Square Yard</u>	<u>Code</u>
	0.33 gallons per square yd.	33
	0.25 gallons per square yd.	25

Stone Pounds Per Square Yard (card 3, columns 31-32)

Record the pounds per square yard of stone intended correct to the nearest pound.

Example:	<u>Pounds Per Square Yard</u>	<u>Code</u>
	25 pounds per square yd.	25

Aggregate Information for Surface Mixes

Record the aggregate information as outlined below for the number of aggregates used in the mix. The aggregate information should always be recorded, regardless of the surface mix type.

1984

Aggregate Size (card 3, columns 33-34, 43, 44, 53-54, 63-64)

Aggregate Percent (card 3, columns 40-42, 50-52, 60-62, 70-72)

The percent of the total mix represented by each aggregate should be recorded correct to the nearest percent as shown in the examples below.

<u>Examples:</u>	<u>Percent of Total Mix</u>	<u>Code</u>
	10 percent	010
	50 percent	050
	100 percent	100

Note: The sprinkle material used in sprinkle mixes should be shown in the aggregate information and recorded as zero percent.

Sequence Number (card 3, columns 75-78)

The sequence number printed in the top right hand corner of form DP-20 should be recorded in columns 75-78 on card 3.

Subsurface Information

The next group of items refer to subsurface courses only. As noted in the introduction, data for subsurface courses will be recorded only for new construction, and should be recorded on form DP-20-A, and submitted as a supplement to form DP-20.

In recording subsurface information, begin at the top of the form for the layer immediately under the surface and work down through the subgrade.

Subgrade — Native — lime stabilized	92
Subgrade — Native — asphalt stabilized	93
Subgrade — Select Borrow — unstabilized	94
Subgrade — Select Borrow — cement stabilized	95
Subgrade — Select Borrow — lime stabilized	96
Subgrade — Select Borrow — asphalt stabilized	97

Depth (card 4, columns 25-27, 34-36, 43-45, 52-54, 61-63)

Record the depth correct to the nearest one-tenth inch. Do not record the decimal point.

<u>Examples:</u>	<u>Depth</u>	<u>Code</u>
	6.0 inches	060
	7.5 inches	075
	12.5 inches	125

Percent Cement/Lime/Asphalt (card 4, columns 28-31, 37-40, 46-49, 55-58, 64-67)

For bituminous concrete mixes record the percent asphalt correct to the nearest one-hundredth. For lime, cement, or asphalt stabilized materials, record the percent of the stabilizing material correct to the nearest one-hundredth. Do not record the decimal point.

- Examples: (1) B-3 mix with 6.0% asphalt, code 0600.
 (2) Cement treated subgrade (5% cement), code 0500.

Sequence Number (card 4, columns 75-78)

The sequence number printed in the top right-hand corner of form DP-20 should be recorded in columns 75-78 on card four.
