

Department of Transportation's

INTELLIGENT
TRANSPORTATION
SYSTEMS (ITS)
PROJECTS BOOK

Compiled by:

U.S. Department of Transportation
Intelligent Transportation Systems (ITS) Joint Program Office

Federal Highway Administration
Office of Travel Management
Office of Safety Research and Development
Office of Motor Carrier Safety and Technology

Federal Transit Administration
Office of Mobility Innovation

National Highway Traffic Safety Administration
Office of Vehicle Safety Research

TABLE OF CONTENTS

I. INTRODUCTION	2
------------------------------	----------

II. METROPOLITAN ITS INFRASTRUCTURE	9
--	----------

Traffic Signal Control

ARIZONA CENTER FOR TRAFFIC AND LOGISTICS ALGORITHMS & SOFTWARE (ATLAS)	16
INTEGRATED RAMP METERING/ADAPTIVE SIGNAL CONTROL, Orange Co., CA	17
NORTH SEATTLE ADVANCED TRAFFIC MANAGEMENT SYSTEM, Seattle, WA.....	18
BROOKLYN-BRONX-QUEENS SIGNALIZATION.....	19
HUNTINGTON BEACH, CA I-405 MULTI-JURISDICTIONAL SMART CORRIDOR AND CALTRANS DISTRICT 12 INTERTIE PROJECT	20
JACKSON, MISSISSIPPI INTELLIGENT TRANSPORTATION SYSTEM IMPLEMENTATION.....	21
SYRACUSE CONGESTION MANAGEMENT SYSTEM.....	22
TEMECULA, CALIFORNIA I-15 TRAFFIC SURVEILLANCE AND SIGNAL SYSTEM INTEGRATION PROJECT...	23
TUCSON, ARIZONA INTEGRATION OF REAL-TIME TRAFFIC INFORMATION FOR ADAPTIVE SIGNAL CONTROL, TRAVELER INFORMATION AND MANAGEMENT OF TRANSIT AND EMERGENCY SERVICES	24
WHITE PLAINS-WESTCHESTER COUNTY, NEW YORK INTEROPERABLE COORDINATED SIGNAL SYSTEM.	25

Freeway Management Systems

ATMS RESEARCH ANALYSIS DATABASE SYSTEM	27
BETA TESTING OF SOFTWARE	28
DATABASES FOR ASSESSMENT OF OPERATIONAL TESTS AND TRAFFIC MODELS.....	29
HUMAN FACTORS COMPUTER - AIDED DESIGN TOOL FOR TRAFFIC MANAGEMENT CENTERS	30
HUMAN FACTORS IN ADVANCED TRAFFIC MANAGEMENT SYSTEMS (ATMS) DESIGN EVOLUTION	31
INTEGRATION OF TRAFFIC OPERATIONS AND TRAFFIC DATA COLLECTIONS	32
BRONX/NORTHERN MANHATTAN ATMS.....	33
CARAT	34
FAIRBORN, OHIO ADVANCED TRAFFIC MANAGEMENT SYSTEM.....	35
I-90 CONNECTOR, RENSSELAER COUNTY, NEW YORK.....	36
I-275, ST. PETERSBURG, FLORIDA	37
I-287 SURVEILLANCE SYSTEM	38
KANSAS CITY REGION INTEGRATED AUTOMATION SYSTEM DEVICES	39
LOUISIANA INTERSTATE 55, 10 AND 610, INTELLIGENT TRANSPORTATION SYSTEMS	40
LOWER HUDSON VALLEY	41
MAGIC (METROPOLITAN AREA GUIDANCE INFORMATION & CONTROL)	42
MOBILE, ALABAMA ITS INTEGRATION	43
MONITOR.....	44
NEW JERSEY TURNPIKE PROJECT	45
NASHVILLE, TENNESSEE AREA INTELLIGENT TRANSPORTATION SYSTEM.....	46
NEVADA ARCHIVED DATA SUBSYSTEM COMPONENT OF LAS VEGAS AREA FREEWAY AND ARTERIAL SYSTEM OF TRANSPORTATION.....	47
SPRINGFIELD, VIRGINIA INTERSTATE INTERCHANGE.....	48
STATE OF TEXAS STATEWIDE SOFTWARE AND SYSTEMS INTEGRATION CENTER-TO-CENTER COMMUNICATIONS PROJECT	49
SYRACUSE, NEW YORK ADVANCED TRANSPORTATION MANAGEMENT SYSTEM.....	50

Transit Management Systems

COMPUTER INTEGRATED TRANSIT MAINTENANCE AND ENVIRONMENT (CITME)	52
CHICAGO SMART INTERMODAL SYSTEM, Chicago, IL.....	53

DALLAS AREA RAPID TRANSIT PERSONALIZED PUBLIC TRANSIT, Dallas, TX.....	54
SMART FLEXROUTE INTEGRATED REAL-TIME ENHANCEMENT SYSTEM (SAFIRES), Northern Virginia	55
SUBURBAN MOBILITY AUTHORITY FOR REGIONAL TRANSPORTATION (SMART) PROJECT, Detroit, MI	57
WINSTON-SALEM MOBILITY MANAGEMENT - PHASE II, Winston-Salem, NC.....	58
ARLINGTON, VIRGINIA TRANSIT PRIORITY AND EMERGENCY VEHICLE PREEMPTION.....	59
CLEVELAND, OHIO TRANSPORTATION MANAGEMENT AND INTEGRATED COMMUNICATIONS CENTER..	60
COLUMBUS, OHIO ITS INTEGRATION - PHASE I	61
RIVERSIDE COUNTY TRANSIT ITS DEMONSTRATION	62
WESTCHESTER/PUTNAM COUNTIES, NEW YORK REGIONAL TRANSIT OPERATIONS INFORMATION INTEGRATION	63
Incident Management Systems	
LAW ENFORCEMENT INTELLIGENT NETWORK SYSTEMS	65
NEW JERSEY POLICE COMMUNICATION CENTER	66
Electronic Toll Collection	
DADE COUNTY EXPRESSWAY, FLORIDA TOLL COLLECTION SYSTEM.....	68
NEW JERSEY ELECTRONIC TOLL AND TRAFFIC MANAGEMENT.....	69
NEW YORK CITY TOLL PLAZA SCANNERS.....	70
Electronic Fare Payment Programs	
MULTI-USE SMART CARD SPECIFICATIONS AND GUIDELINES DEVELOPMENT.....	72
NORTHERN VIRGINIA REGIONAL FARE SYSTEM.....	73
WILMINGTON, DELAWARE SMART DART	74
Railroad Crossings	
RAILROAD CROSSING VEHICLE PROXIMITY ALERT SYSTEM, Pueblo, CO	76
RAILROAD HIGHWAY CROSSING - LONG ISLAND, NY, Long Island, NY	77
Regional Multimodal Traveler Information	
ANALYSIS OF TRAVELERS' PREFERENCES FOR ROUTING	80
DYNAMIC TRAFFIC ASSIGNMENT AND SYNTHETIC ORIGIN AND DESTINATION MATRICES	81
WASHINGTON METROPOLITAN TRAVELER INFORMATION SERVICES PROJECT: REGIONAL IMPACTS MODELING	83
HOUSTON SMART COMMUTER, Houston, TX.....	84
LYNX PASSENGER TRAVEL PLANNING SYSTEM, FL.....	85
MIAMI REAL-TIME PASSENGER INFORMATION SYSTEM, Dade Co., FL.....	86
NEW YORK CITY METROPOLITAN TRANSPORTATION AUTHORITY TRAVEL INFORMATION SYSTEM, New York City metro area.....	87
TRAVINFO, San Francisco, CA	88
ADVANCE CORRIDOR TRANSPORTATION INFORMATION CENTER	89
INGLEWOOD, CALIFORNIA ATMS PROJECT	90
INTEGRATED CORRIDOR MANAGEMENT	91
KANSAS CITY, MISSOURI INTERMODAL COMMON COMMUNICATIONS TECHNOLOGY	92
MARKET STREET AND PENNSYLVANIA CONVENTION CENTER PASSENGER INFORMATION CENTER	93
NATIONAL CAPITAL REGION CONGESTION MITIGATION	94
PENNSYLVANIA TURNPIKE TRAVELER INFORMATION SYSTEM	95
WASHINGTON, D.C. - PARTNERS IN MOTION (TRAVELER INFORMATION PROJECT).....	96
SPRINGFIELD, MISSOURI REGION ITS PLANNING DOCUMENT	97
RALEIGH, WAKE CO., NORTH CAROLINA ITS INTEGRATION	98
Integrated Systems – Priority Corridors	
HOUSTON ITS PRIORITY CORRIDOR.....	100

I-95 NORTHEAST CORRIDOR	104
MIDWEST (GARY-CHICAGO-MILWAUKEE) ITS PRIORITY CORRIDOR.....	107
SOUTHERN CALIFORNIA CORRIDOR	109
Integrated Systems – Metropolitan Model Deployment Initiatives	
NEW YORK-NEW JERSEY-CONNECTICUT (TRANSCOM) ITS INFRASTRUCTURE MODEL DEPLOYMENT	112
PHOENIX, ARIZONA AZTECH MODEL DEPLOYMENT INITIATIVE	113
SAN ANTONIO, TEXAS TRANSGUIDE METROPOLITAN MODEL DEPLOYMENT	115
SEATTLE, WASHINGTON SMART TREK MODEL DEPLOYMENT	116
Integrated Systems – Statewide/Regional Integration Programs	
MINNESOTA GUIDESTAR PROGRAM.....	118
SOUTHERN STATE PARKWAY	124
TRANSCOM CONGESTION MANAGEMENT PROGRAM.....	126
UTAH ITS INTEGRATION	127
STATE OF NEW MEXICO STATEWIDE ITS ARCHITECTURE.....	128
WASHINGTON, DC METROPOLITAN REGION ITS INTEGRATION	130
Integrated Systems – Individual Projects	
NORTH DAKOTA STATE UNIVERSITY ADVANCED TRAFFIC ANALYSIS CENTER	134
RESEARCH AND ANALYSIS SUPPORT FOR THE ITS PROGRAM	135
SUPPORT SERVICES FOR THE FHWA HUMAN FACTORS PROGRAMS	136
FAST-TRAC, Oakland Co., MI	137
MONTGOMERY COUNTY ADVANCED TRANSPORTATION MANAGEMENT SYSTEM, Montgomery Co., MD ..	138
ATLANTA, GEORGIA ITS COMPONENT INTEGRATION - PHASE I.....	139
COLORADO I-25 TRUCK SAFETY IMPROVEMENTS.....	140
CORPUS CHRISTI, TEXAS, INTEGRATION OF INTELLIGENT TRANSPORTATION SYSTEMS.....	141
DEL RIO, TEXAS INTEGRATION OF INTELLIGENT TRANSPORTATION SYSTEMS.....	142
GREAT LAKES IMPLEMENTATION	143
I-880/SR 17 SMART CORRIDOR IMPROVEMENTS-SILICON VALLEY, CALIFORNIA	144
INTELLIGENT TRANSPORTATION SYSTEMS INTEGRATION PROJECT FOR TRANSPORTATION OPERATORS IN SOLANO COUNTY	145
ITS IMPROVEMENT PROJECT FOR NIAGARA INTERNATIONAL TRANSPORTATION TECHNOLOGY COALITION (NITTEC) AND WESTERN NEW YORK INCIDENT MANAGEMENT.....	146
LAREDO, TEXAS, INTEGRATION OF INTELLIGENT TRANSPORTATION SYSTEMS	147
MOBILE, ALABAMA FOG DETECTION SYSTEM.....	149
MONTGOMERY, ALABAMA INTELLIGENT TRANSPORTATION SYSTEM	150
NEW YORK CITY MULTI-OPERATING AGENCY INTEGRATED TRANSPORTATION MANAGEMENT SYSTEM (ITMS).....	151
NEW YORK CITY/LONG ISLAND TRANSPORTATION MANAGEMENT CENTER (TMC) INTEGRATION	152
ROCHESTER, NEW YORK CONGESTION MANAGEMENT	153
SALT LAKE VALLEY ATMS SYSTEMS INTEGRATION	154
SAN FRANCISCO, CALIFORNIA INTEGRATED TRANSPORTATION MANAGEMENT SYSTEM PROJECT	155
ST. LOUIS REGION SMART INTEGRATED METROPOLITAN AREA MAP	156
STATE OF MISSISSIPPI ITS INTEGRATION PROJECT	158
STATE OF NEW JERSEY	159
SUTTER COUNTY, CALIFORNIA	160
TUSCALOOSA, AL, TRAFFIC INTEGRATION AND FLOW CONTROL	161
Special Purpose	
TRANSLINK.....	163
NASHVILLE, TENNESSEE TRAFFIC AND PARKING GUIDANCE SYSTEM	164

Completed Projects

ADA COUNTY TRAVEL DEMAND MANAGEMENT EMISSIONS DETECTION, Ada Co., Boise, ID.....	166
ADDITIONAL PROTOTYPE DEVELOPMENT (RT-TRACS).....	167
ADVANCE, Chicago, IL	168
ALTERNATE BUS ROUTING, NJ.....	170
ANN ARBOR SMART INTERMODAL, Ann Arbor, MI.....	171
APTS TECHNOLOGY RESEARCH	172
ATLANTA ATIS-KIOSK PROJECT, Atlanta, GA	173
ATLANTA DRIVER ADVISORY SYSTEM (ADAS), Atlanta, GA	174
ATLANTA TRAVELER INFORMATION SHOWCASE	175
BALTIMORE-WASHINGTON CORRIDOR: SURVEILLANCE INFRASTRUCTURE IMPLEMENTATION	176
BARBOURSVILLE-ONA, WEST VIRGINIA TRAFFIC MANAGEMENT	177
BORMAN EXPRESSWAY ADVANCED TRAFFIC MANAGEMENT SYSTEM (ATMS) PHASE I.....	178
BOSTON SMARTRAVELER, Boston, MA	179
BUFFALO/NIAGARA FALLS ATMS.....	180
CALIFORNIA SMART TRAVELER, Los Angeles & Orange Co., CA.....	181
CAPITAL: WASHINGTON, D.C. AREA OPERATIONAL TEST, Washington, D.C. metro area	182
CHART STRATEGIC PLAN - MARYLAND.....	183
CONNECTICUT FREEWAY ADVANCED TRAFFIC MANAGEMENT SYSTEMS (ATMS), Hartford, CT.....	184
DELAWARE COUNTY RIDETRACKING, Delaware Co., PA	185
DENVER, COLORADO RAPID TRANSIT DISTRICT (RTD) PASSENGER INFORMATION DISPLAY SYSTEM, Denver, CO.....	186
DETECTION TECHNOLOGY FOR ITS.....	187
DETROIT, MICHIGAN AREA WIDE DEPLOYMENT OF ATMS/ATIS	188
DETROIT TRANSPORTATION CENTER TRANSIT INFORMATION, Detroit, MI	189
DIRECT, Detroit, MI	190
EVALUATING ENVIRONMENTAL IMPACTS OF ITS USING LIDAR, Minneapolis-St. Paul, MN	191
EVALUATION OF REAL-TIME TRAFFIC ADAPTIVE SIGNAL CONTROL PROTOTYPES	192
FM/SCA PROTOTYPE FOR TRAFFIC INFORMATION BROADCAST	193
FUEL CONSUMPTION AND EMISSION VALUES FOR TRAFFIC MODELS	194
GENESIS, Minneapolis-St. Paul, MN	195
GIS APPLICATIONS AND TECHNICAL SUPPORT	196
GOLDEN GLADES INTERCHANGE	197
HUMAN FACTORS PROGRAMS: ADMINISTRATIVE AND TECHNICAL SUPPORT.....	198
INCIDENT DETECTION ISSUES - PART I : FREEWAYS.....	199
INTELLIGENT CORRIDOR SYSTEM.....	200
INTELLIGENT TRANSPORTATION SYSTEMS - POLICY, OPERATIONS AND SYSTEMS RESEARCH CENTER	201
ITS FOR VOLUNTARY EMISSIONS REDUCTION, Denver, CO.....	202
ITS MODELS AND SIMULATION SYSTEMS PROGRAM.....	203
JOHNSON CITY, TN	204
KANSAS CITY - INTELLIGENT TRANSPORTATION SYSTEM DEPLOYMENT.....	205
MOBILE COMMUNICATIONS SYSTEM, Orange Co., CA.....	206
MONTGOMERY ADVANCED TRAFFIC MANAGEMENT SYSTEM	207
MULTI-JURISDICTIONAL LIVE AERIAL VIDEO SURVEILLANCE SYSTEM, I, Fairfax Co., VA.....	208
MULTI-JURISDICTIONAL LIVE AERIAL VIDEO SURVEILLANCE SYSTEM, II, Montgomery Co., MD	209
NETWORK-WIDE OPTIMIZATION OF MODELS.....	210
NEW JERSEY SIGNAL COMPUTERIZATION	211
NEW YORK THRUWAY AUTHORITY ALBANY TRAFFIC OPERATIONS CENTER	212
NEW YORK THRUWAY ELECTRONIC TOLL COLLECTION AND TRAFFIC MANAGEMENT.....	213
NORFOLK MOBILITY MANAGER, Norfolk, VA.....	214
NORTHERN VIRGINIA TRAFFIC SIGNAL MANAGEMENT SYSTEM.....	215
PORTLAND SMART BUS, Portland, OR.....	216
REAL-TIME TRAFFIC ADAPTIVE SIGNAL CONTROL FOR ITS.....	217

SACRAMENTO RIDESHARE, Sacramento, CA.....	218
SALT LAKE CITY INTERIM TRAFFIC OPERATIONS CENTER	219
SAN ANTONIO TRANSGUIDE, San Antonio, TX.....	220
SANTA CLARA COUNTY SMART VEHICLE, Santa Clara, CA.....	222
SATELLITE COMMUNICATIONS FEASIBILITY, Philadelphia, PA	223
SCOOT ADAPTIVE TRAFFIC CONTROL SYSTEM, Anaheim, CA	224
SEATTLE SMART TRAVELER, Seattle, WA metro area.....	225
SEATTLE WIDE-AREA INFORMATION FOR TRAVELERS (SWIFT), Seattle, WA	226
SMART CALL BOX, San Diego, CA	227
SPREAD SPECTRUM RADIO TRAFFIC INTERCONNECT, Los Angeles, CA.....	228
TRAFFIC RESEARCH LABORATORY (TREL)	229
TRAFFIC SURVEILLANCE AND DETECTION TECHNOLOGY DEVELOPMENT.....	230
TRANSIT COMPUTER TOOLS	231
TRANSIT NETWORK ROUTE DECISION AID	232
TRANSIT TECHNOLOGY RESEARCH.....	233
TRANSLINK RESEARCH AND DEVELOPMENT PROGRAM	234
TRANSMIT, Rockland & Bergen Co., NJ.....	235
TRAVLINK, Minneapolis, MN.....	236
TRAVTEK, Orlando, FL	237
TRILOGY, Minneapolis-St. Paul, MN	238
WASHINGTON, D.C. ADVANCED FARE MEDIA, Washington, D.C. metro area.....	239
WINSTON-SALEM MOBILITY MANAGEMENT, Winston-Salem, NC.....	240

III. INTELLIGENT RURAL INFRASTRUCTURE.....242

Surface Transportation Weather and Winter Mobility

ADVANCED TRANSPORTATION WEATHER INFORMATION SYSTEM, ND, SD.....	246
FORETELL - INTEGRATING ITS WITH ADVANCED WEATHER PREDICTION, IA, WI, MO, MN, IL.....	247
IDAHO STORM WARNING SYSTEM, ID.....	248
SPOKANE, WASHINGTON STATE ROUTE 395 TRAVELER INFORMATION PROJECT.....	249
SULLIVAN COUNTY, NEW YORK EMERGENCY WEATHER SYSTEM	250
WASHINGTON STATE ROADWAY WEATHER INFORMATION SYSTEM	251

Statewide/Regional Traveler Information Infrastructure

DEVELOPMENT OF RURAL ITS.....	253
RURAL APPLICATIONS OF ADVANCED TRAVELER INFORMATION SYSTEMS	254
ACADIA NATIONAL PARK FIELD OPERATIONAL TEST, Acadia National Park, ME.....	255
ARIZONA I-40 TRAVELER AND TOURIST INFORMATION SYSTEM, AZ.....	256
ADVANCED RURAL TRANSPORTATION INFORMATION AND COORDINATION, Itasca & St. Louis Co., MN.....	257
BRANSON, MISSOURI TRIP (TRAVEL AND RECREATIONAL INFORMATION PROJECT), MO	258
CAPE COD RURAL ADVANCED INTERMODAL TRANSPORTATION SYSTEM, MA.....	259
FRANKLIN COUNTY, MASSACHUSETTS TRAVEL INFORMATION SYSTEM.....	260
GREATER YELLOWSTONE RURAL ITS PROJECT, ID, MT.....	261
HERALD EN-ROUTE DRIVER ADVISORY SYSTEM VIA AM SUBCARRIER, CO, IA	262
BRANDON, VERMONT.....	263
CUMBERLAND GAP TUNNEL AND REGIONAL DEPLOYMENT (MIDDLESBORO, KENTUCKY).....	264
I-90/I-94 RURAL WISCONSIN ITS CORRIDOR.....	265
MONROE COUNTY, NEW YORK INTEGRATION PROJECT	266
PORT ANGELES, WASHINGTON.....	267
STATE OF IDAHO ITS INTEGRATION.....	268
STATE OF WASHINGTON ITS DEPLOYMENT AND INTEGRATION.....	269
STATE OF WISCONSIN ITS INTEGRATION	271
WARREN COUNTY, VIRGINIA	272

WAUSAU/STEVENS POINT, WISCONSIN	273
Emergency Services	
AUTOMATED COLLISION NOTIFICATION (ACN) OPERATIONAL FIELD TEST, Erie Co., NY	275
WASHINGTON STATE RADIO COMMUNICATION EMERGENCY CALL BOXES	276
Rural Crash Prevention	
TRAVEL - AID, WA	278
Rural Transit Mobility	
NORTH FLORIDA RURAL TRANSIT INTELLIGENT TRANSPORTATION SYSTEMS, FL	280
FITCHBURG, MASSACHUSETTS-MONTACHUSETT REGIONAL TRANSIT AUTHORITY ITS INTEGRATON	281
Rural Traffic Management	
RURAL ITS SWISS ARMY KNIFE TRAILER	283
Highway Operations and Maintenance	
AN AUTOMATED VEHICLE LOCATION PILOT SYSTEM IN A MAINTENANCE OPERATIONS SETTING	285
ALASKA COLD WEATHER ITS SENSING	286
OAKLAND COUNTY, MICHIGAN – SOUTHEAST MICHIGAN SNOW AND ICE MANAGEMENT (SEMSIM)	287
Completed Projects	
BLACKSBURG RURAL TRAVELER INFORMATION SYSTEM, Blacksburg, VA.....	290
COLORADO MAYDAY SYSTEM, CO.....	291
EVALUATION OF RADIO AND MICROWAVE TECHNOLOGY FOR MOTOR VEHICLE SAFETY WARNING SYSTEMS	292
IDENTIFICATION OF SIMPLE SOLUTIONS FOR THE RURAL TRANSPORTATION SYSTEM.....	293
ROGUE VALLEY MOBILITY MANAGEMENT, Medford, OR.....	294
TRANSCAL, CA, NV.....	295
IV. COMMERCIAL VEHICLE ITS INFRASTRUCTURE	297
Safety Assurance	
DYNAMIC TRUCK SPEED WARNING FOR LONG DOWNGRADES, CO.....	300
ROUTE 236/I-495 NORTHERN VIRGINIA INTELLIGENT TRANSPORTATION SYSTEM	301
Electronic Screening	
ELECTRONIC CLEARANCE FOR INTERNATIONAL BORDERS, MI, NY, CA, AZ, TX	303
ITS/CVO GREENLIGHT PROJECT, OR	304
COUTTS/SWEET GRASS AUTOMATED BORDER CROSSING PROPOSAL.....	305
Carrier Operations	
NATIONAL INSTITUTE FOR ENVIRONMENTAL RENEWAL (NIER), PA, CA	307
OPERATION RESPOND, TX, CT, MI, CO, MN, CA, WA, OR.....	308
Integrated Systems	
CVISN - MODEL DEPLOYMENT (COMMERCIAL VEHICLE INFORMATION SYSTEMS & NETWORKS), KY, CT, MI, CO, MN, CA, WA, OR.....	310
Completed Projects	
ADVANTAGE CVO, FL, GA, TN, KY, OH, MI, Ontario	312

ASSESSMENT OF STATE BENEFITS AND COSTS FROM ITS/CVO SERVICES	313
AUTOMATED SAFETY ASSESSMENT PROGRAM	314
AUTOMATED SAFETY ASSESSMENT PROGRAM (ASAP) PILOT ON HAZARDOUS MATERIAL CARRIERS.....	315
BLACK BOX DEVELOPMENT	316
COMMERCIAL VEHICLE CREDENTIAL SYSTEM ARCHITECTURE.....	317
COMMERCIAL VEHICLE FLEET MANAGEMENT AND INFORMATION SYSTEMS.....	318
CVISN - DESIGN OF A COMMERCIAL VEHICLE INFORMATION SYSTEM NETWORK.....	319
CVISN - PROTOTYPE OF A COMMERCIAL VEHICLE INFORMATION SYSTEM NETWORK	320
DEVELOPMENT, EVALUATION, AND APPLICATION OF BRAKE TESTING DEVICES-BATTELLE MEMORIAL INSTITUTE	321
ELECTRONIC ONE-STOP SHOPPING OPERATIONAL TESTS, CA, AZ, NM, IA, MN, NE, WI, KS, MD, IL, SD, CO, AR, TX.....	322
INTER-REGIONAL INSTITUTIONAL STUDY PROJECT	323
ITS/CVO COMMUNICATIONS-OUTREACH PLAN.....	324
ITS/CVO LEGAL & PRIVACY STUDY	325
MODIFICATIONS TO SAFETYNET	326
ON-BOARD BRAKE RESEARCH AND TESTING.....	327
ON-BOARD DRIVER MONITORING/FITNESS-FOR-DUTY TESTING, OR.....	328
OUT-OF-SERVICE VERIFICATION OPERATIONAL TESTS, MN, WI, ID	329
PASS, OR	330
ROADSIDE MCSAP COMPUTER SYSTEM (200 SITES)), 45 states.....	331
SAFETY AND FITNESS ELECTRONIC RECORDS SYSTEM (SAFER)	333
SMART CARD DEVELOPMENT.....	334
SYSTEMS PLANNING FOR AUTOMATED COMMERCIAL VEHICLE LICENSING AND PERMITTING SYSTEMS	335
V. INTERMODAL FREIGHT.....	337
Intermodal Freight	
DEPLOYMENT OF ITS TECHNOLOGY TO FACILITATE MOVEMENTS OF INTERMODAL FREIGHT, Seattle,WA.....	340
AN INTEGRATED CARGO INFORMATION & SECURITY SYSTEM FOR INTERMODAL DISTRIBUTION CHANNELS, Chicago, IL.....	341
VI. INTELLIGENT VEHICLE INITIATIVE (IVI)	343
Driver Assistance – Safety Systems	
ADVANCED VEHICLE CONTROL SYSTEMS INFRASTRUCTURE AND TRAFFIC IMPACTS	347
BENEFIT ASSESSMENT OF INTELLIGENT VEHICLE SYSTEMS	348
DEVELOPMENT AND EVALUATION OF THE DRIVER INTERFACE FOR A REAR OBJECT WARNING SYSTEM	349
DEVELOPMENT, EVALUATION, AND DEPLOYMENT OF FORWARD CRASH AVOIDANCE SYSTEMS (FOCAS)	350
(DRIVER PERFORMANCE, OLDER DRIVER) THE EFFECT OF FALSE ALARMS ON OLDER DRIVER RESPONSE TO FORWARD COLLISION WARNINGS	351
HAPTIC DISPLAYS FOR FORWARD COLLISION WARNING SYSTEMS	352
PERFORMANCE SPECIFICATIONS: COUNTERMEASURES AGAINST LANE CHANGE, MERGING, AND BACKING COLLISIONS, PHASE III	353
SYSTEM FOR ASSESSMENT OF VEHICLE MOTION ENVIRONMENT (SAVME).....	354
Driver Assistance – Information Systems	
FEASIBILITY OF SENSOR-FRIENDLY VEHICLES AND ROADWAYS TO SUPPORT INTELLIGENT VEHICLE SERVICES	356

IN-VEHICLE DISPLAY ICONS AND OTHER INFORMATION ELEMENTS	357
IN-VEHICLE INFORMATION SYSTEMS BEHAVIORAL MODEL AND DESIGN SUPPORT	358
NIGHT DRIVER THERMAL IMAGING CAMERA AND HEAD UP DISPLAY DEVELOPMENT PROGRAM FOR CRASH AVOIDANCE	359
TECHNICAL SUPPORT FOR IVIS DEVELOPMENT AND OPERATIONAL TEST	360
 Platform Specific - Emergency Use and Specialty Use Vehicles	
OPERATIONAL REVIEW OF SPECIALTY VEHICLE	362
GENERATION 0 FIELD OPERATIONAL TEST - MINNESOTA DEPARTMENT OF TRANSPORTATION, MN	363
 Platform Specific - Commercial Vehicles	
GENERATION 0 FIELD OPERATIONAL TEST - FREIGHTLINER CORPORATION, IN	365
GENERATION 0 FIELD OPERATIONAL TEST - MACK TRUCKS, INC, FL, MD, VA	366
GENERATION 0 FIELD OPERATIONAL TEST - VOLVO TRUCKS NORTH AMERICA, INC, Nationwide	367
 Completed Projects	
ANALYTICAL SUPPORT/ANALYSIS OF ACCIDENT AND DRIVER PERFORMANCE DATABASES	369
ASSESSMENT OF POTENTIAL BIOLOGICAL EFFECTS FROM ELECTROMAGNETIC RADIATION IN MICROWAVE AND INFRARED REGIONS	370
AUTOMOTIVE COLLISION AVOIDANCE SYSTEM DEVELOPMENT	371
AUTONAV/DOT	372
BRAKING ANALYSIS FOR COLLISION AVOIDANCE: HEAVY COMMERCIAL VEHICLES	373
CHARACTERIZATION OF A FORWARD-LOOKING AUTOMOTIVE RADAR SENSOR	374
COMMERCIAL VEHICLE COMMUNICATION AND POWERING ENHANCEMENT SYSTEMS - I	375
COMMERCIAL VEHICLE COMMUNICATION AND POWERING ENHANCEMENT SYSTEMS - II	376
CRASH AVOIDANCE AND THE OLDER DRIVER	377
CRASH AVOIDANCE METRICS PARTNERSHIP (CAMP) - REAR-END COLLISION WARNING RESEARCH, TEST METRICS AND TEST METHODOLOGY DEVELOPMENT PROGRAM	378
CRASH AVOIDANCE RESEARCH TECHNOLOGY SUPPORT FOR COMMUNICATIONS, ELECTRONIC CONTROLS AND COMPUTERS - TASK ORDER 1	379
CRASH AVOIDANCE RESEARCH TECHNOLOGY SUPPORT FOR COMMUNICATIONS, ELECTRONIC CONTROLS AND COMPUTERS - TASK ORDER 2	380
CRASH AVOIDANCE RESEARCH TECHNOLOGY SUPPORT FOR COMMUNICATIONS, ELECTRONIC CONTROLS, AND COMPUTERS - TASK ORDER 3	381
CRASH AVOIDANCE RESEARCH TECHNOLOGY SUPPORT FOR COMMUNICATIONS, ELECTRONIC CONTROLS, AND COMPUTERS - TASK ORDER 4	382
DEVELOP AN ANALYTICAL MODELING FRAMEWORK/COLLISION AVOIDANCE SYSTEM	383
DIRECT PSYCHOPHYSIOLOGICAL MONITORING OF DRIVER ALERTNESS	384
DRIVER STATUS/PERFORMANCE MONITORING	385
EVALUATION OF ASSESSING POTENTIAL HEALTH HAZARDS FROM WIDE-SPREAD USAGE OF ANTI- COLLISION DEVICES USING ITS TECHNOLOGIES	386
HEAD UP DISPLAY (HUD): DRIVER AGE AND VISUAL INTERFERENCE CONCERNS	387
HEAVY VEHICLE INTELLIGENT DYNAMIC STABILITY ENHANCEMENT SYSTEMS	388
HUMAN FACTORS DESIGN OF AUTOMATED HIGHWAY SYSTEMS	389
HUMAN FACTORS IN ATIS AND CVO DESIGN EVOLUTION	390
HUMAN FACTORS REQUIREMENTS FOR SIDE OBJECT DETECTION WARNING SYSTEMS	391
HUMAN FACTORS STUDIES FOR THE EVALUATION, ANALYSIS, AND OPERATIONAL ASSESSMENT OF AN INTELLIGENT CRUISE CONTROL SYSTEM	392
INTELLIGENT CRUISE CONTROL FIELD OPERATIONAL TEST, MI	393
INTERSECTION COLLISION AVOIDANCE USING ITS COUNTERMEASURES	394
IN-VEHICLE CRASH AVOIDANCE WARNING SYSTEM - HUMAN FACTORS CONSIDERATIONS	395
IN-VEHICLE SAFETY ADVISORY AND WARNING SYSTEMS (IVSAWS)	396
NATIONAL AUTOMATED HIGHWAY SYSTEM CONSORTIUM	397

PATH COOPERATIVE AVCSS RESEARCH PROGRAM.....	398
PERFORMANCE SPECIFICATIONS: COUNTERMEASURES AGAINST LANE CHANGE, MERGING, AND BACKING COLLISIONS, PHASES I AND II.....	399
PERFORMANCE SPECIFICATIONS: COUNTERMEASURES AGAINST REAR-END COLLISIONS	400
PERFORMANCE SPECIFICATIONS: COUNTERMEASURES AGAINST ROADWAY DEPARTURE COLLISIONS.....	401
PORTABLE HUMAN FACTORS DATA ACQUISITION SYSTEM FOR CRASH AVOIDANCE RESEARCH (DASCAR)	402
PRELIMINARY HUMAN FACTORS REVIEW OF INTELLIGENT VEHICLE INITIATIVE (IVI).....	403
PROBLEM DEFINITION AND ANALYSIS OF TARGET CRASHES AND ITS COUNTERMEASURE ACTIONS	404
PROTOTYPE HEAVY VEHICLE DROWSY DRIVER DETECTION AND WARNING SYSTEM.....	405
PUGET SOUND HELP ME (PUSHME) MAYDAY SYSTEM, WA.....	406
RESEARCH AND TECHNOLOGY REVIEW FOR DRIVER VISION ENHANCEMENT SYSTEMS.....	407
REVIEW OF SOCIETAL AND INSTITUTIONAL FACTORS FOR THE INTELLIGENT VEHICLE INITIATIVE	408
SAFETY EVALUATION OF TRAVTEK OPERATIONAL TEST	409
STANDARDIZED DRIVING SIMULATION TASKS AND SCENARIOS	410
VARIABLE DYNAMIC TEST VEHICLE DEVELOPMENT.....	411
VEHICLE-BASED LANE DETECTION.....	412
VEHICLE FEEDBACK CUES AND DRIVER PERFORMANCE	413
VII. EVALUATION/PROGRAM ASSESSMENT.....	415
Research	
ADVANCED PUBLIC TRANSPORTATION SYSTEMS (APTS) OPERATIONAL TEST EVALUATIONS.....	418
EVALUATION OF AUTOMATED COLLISION NOTIFICATION OPERATIONAL FIELD TEST.....	419
ITS PROGRAM ASSESSMENT SUPPORT (IPAS)	420
ITS USER ACCEPTANCE RESEARCH	421
METROPOLITAN ITS INFRASTRUCTURE DEPLOYMENT TRACKING.....	422
Completed Projects	
EVALUATION SUPPORT FOR ITS OPERATIONAL TESTS	424
ITS BENEFITS ASSESSMENT FRAMEWORK	425
ITS NATIONAL INVESTMENT AND MARKET ANALYSIS.....	426
ITS OPERATIONAL TEST META-EVALUATION	427
MEASURING USER RESPONSE AT OPERATIONAL TESTS.....	428
VIII. ARCHITECTURE, STANDARDS, AND NATIONAL COMPATIBILITY PLANNING	430
Research	
ELECTROMAGNETIC COMPATIBILITY TESTING FOR ITS.....	434
INTELLIGENT TRANSPORTATION SYSTEMS (ITS) SPATIAL DATA INTEROPERABILITY	435
INTELLIGENT TRANSPORTATION SYSTEM STANDARDS PROGRAM	436
NATIONAL ARCHITECTURE DEPLOYMENT SUPPORT.....	439
Completed Projects	
AUGMENTATION FOR GPS	441
ITS COMMUNICATIONS ALTERNATIVES TEST AND EVALUATION	442
NATIONAL ARCHITECTURE DEVELOPMENT.....	443
SYSTEM ARCHITECTURE CONSENSUS BUILDING AND OUTREACH.....	444

IX. MAINSTREAMING446

Early Deployment Planning

AKRON, OHIO METROPOLITAN AREA EARLY DEPLOYMENT PLANNING STUDY	448
BALTIMORE, MARYLAND EARLY DEPLOYMENT PLANNING STUDY	449
FORT LAUDERDALE, FLORIDA AREAWIDE EARLY DEPLOYMENT PLANNING STUDY	450
HARRISBURG/LEBANON/CARLISLE, PENNSYLVANIA EARLY DEPLOYMENT PLANNING STUDY	451

I. INTRODUCTION

I. INTRODUCTION

Intelligent Transportation Systems (ITS), formerly Intelligent Vehicle-Highway Systems (IVHS), provide the technology applications helping the nation address current surface transportation problems while concurrently providing approaches for dealing with future demands through a strategic, intermodal view of transportation. ITS applies proven and emerging technologies in fields such as data processing, communications, control, navigation and electronics to surface transportation challenges. While ITS technologies alone cannot satisfy the nation's growing transportation needs, they provide the means to revise current approaches to problem solving and improve the efficiency and cost-effectiveness of existing systems. When deployed and effectively integrated, ITS technologies provide meaningful benefits including more efficient use of the nation's infrastructure and of energy resources, complemented by measurable improvements in safety, mobility, productivity and accessibility.

To foster national deployment and integration of ITS technologies, the U.S. Department of Transportation (U.S. DOT) initiated a multi-faceted ITS program involving research and field operational testing of promising ITS technology applications. The previous edition of this document addressed program direction during the first year authorized by the Transportation Equity Act for the 21st Century (TEA-21), signed into law in July 1998. Many of the projects described in this document were initiated during the period authorized by the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA). The previous edition of the ITS Projects Book was the first to reflect the restructuring of the ITS Program into Intelligent Infrastructure categories and the Intelligent Vehicle Initiative. This edition continues to categorize both legacy projects (originating under ISTEA), and those begun since the enactment of TEA-21, according to this program structure.

For continuity and completeness, a brief description of the program realignment is included in the following narrative.

The realignment of the program from eight technical areas into the new structure reflects U.S. DOT's goals for facilitating deployment of intelligent infrastructure in the three areas: metropolitan, rural, and commercial vehicle. Concurrently, the program will facilitate the research, testing, and evaluation of intelligent vehicle technology. Figure 1 depicts the current program structure.

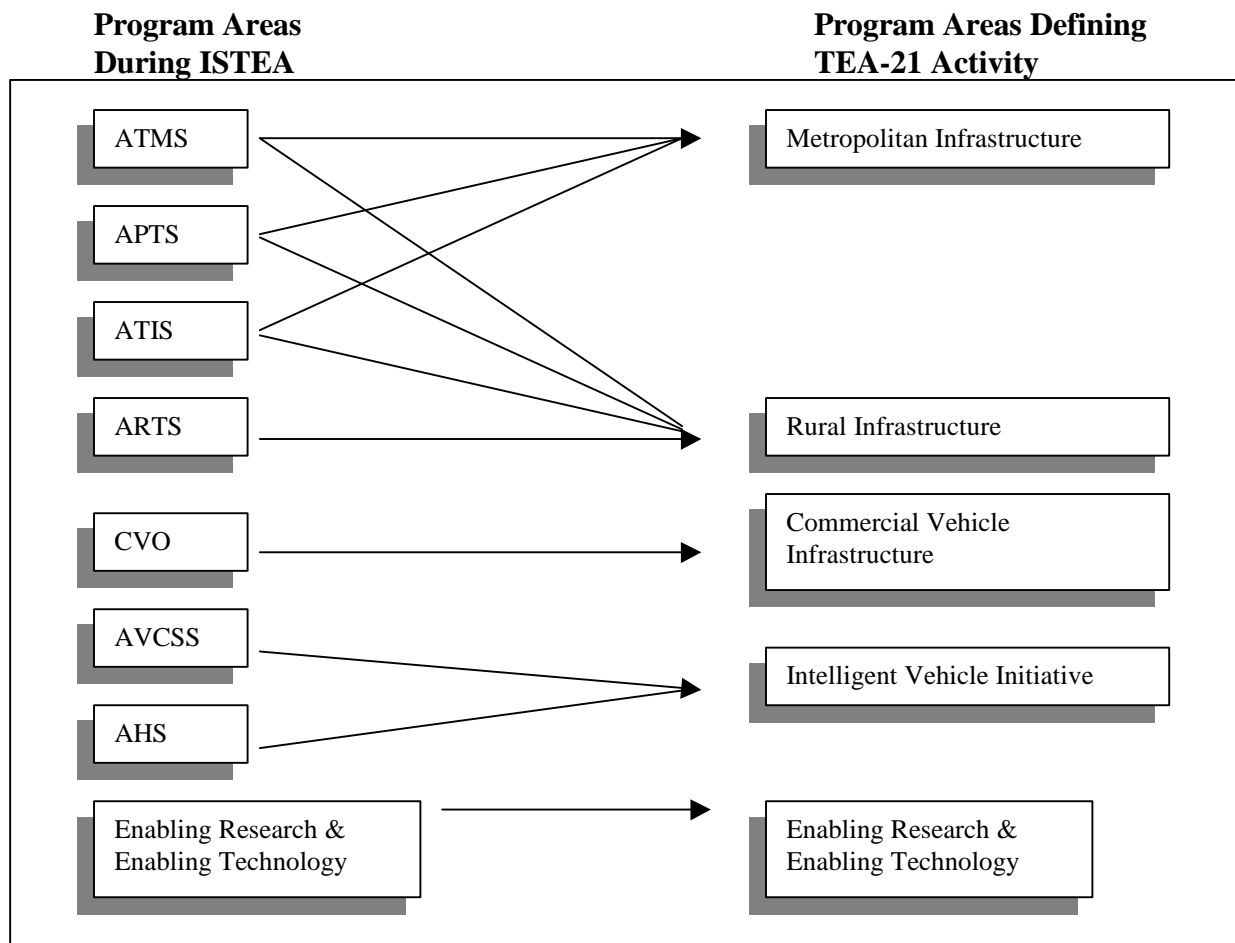

Figure 1

INTELLIGENT INFRASTRUCTURE	INTELLIGENT VEHICLES
<ul style="list-style-type: none">• Metropolitan• Rural/Statewide• Commercial Vehicle	<ul style="list-style-type: none">• Light• Transit• Trucks• Emergency & Specialty Vehicles

The program reorientation reflects the evolution of emphasis on deployment whose outputs are infrastructure and/or vehicles. Metropolitan ITS Infrastructure inherits the research in Advanced Traffic Management Systems, Advanced Public Transportation Systems and Advanced Traveler Information Systems. The Rural ITS Infrastructure encompasses the activities of Advanced Rural Transportation Systems program that includes the application of technologies under development for Metropolitan and Commercial Vehicle Infrastructure that are adaptable to rural community needs. The Commercial Vehicle ITS infrastructure continues to build on the research endeavors of the Commercial Vehicle Operations Program, and is heavily focused on the deployment of Commercial Vehicle Information Systems and Networks (CVISN). The Intelligent Vehicle Initiative integrates the work accomplished in various facets of intelligent vehicle research and development to include the Advanced Vehicle Control and Safety Systems Program.

The Enabling Research and Technology program area continues to provide crosscutting support to each of the four functional components comprising the program's foundation. Figure 2 provides a crosswalk depicting the dynamics of the realignment.

Figure 2 -ITS Program Reorientation

Program Area Acronyms

ATMS	Advanced Traffic Management Systems
APTS	Advanced Public Transportation Systems
ATIS	Advanced Traveler Information Systems
ARTS	Advanced Rural Transportation Systems
CVO	Commercial Vehicle Operations
AVCSS	Advanced Vehicle Control and Safety Systems
AHS	Automated Highway Systems

The documents guiding ITS Program direction are evolving. The enactment of TEA-21 reflects Congressional reaffirmation of the role U.S. DOT will play in advancing the development and integrated deployment of ITS technologies. U.S. DOT's goals, key activities, and milestones for fiscal years (FY) 1999 through 2003 are described in the National Intelligent Transportation Systems Five-Year Program Plan to be released in February 2000. This five-year plan will be followed in 2001 by a ten-year program plan that sets forth the next-generation research agenda for ITS. These two documents, combined with the Intelligent Transportation Society of America's national deployment strategy, will address ITS deployment and research challenges for stakeholders in the public and private sectors.

Within the restructured framework, the ITS Program is focused on activities impacting both near term and long term horizons.

Near Term. Through the end of FY 2003, the effective period of TEA-21, the program will focus on facilitating integrated deployment of ITS components in the defined infrastructure categories.

- **Metropolitan ITS Infrastructure** will integrate various components of advanced traffic management, traveler information, and public transportation systems to achieve improved efficiency and safety and providing enhanced information and travel options for the public.
- **Commercial Vehicle ITS Infrastructure** is oriented on integrating technology applications for improving commercial vehicle safety, enhancing efficiency and facilitating regulatory processes for the trucking industry and government agencies. The principal instrument of this component is known as **Commercial Vehicle Information Systems and Networks** (CVISN), a system of information systems that link the nodes supporting communications among carriers and agencies.
- **Rural ITS Infrastructure** is characterized by a framework of seven development tracks such as Surface Transportation Weather and Winter Mobility and Rural Transit Mobility. ITS technologies are demonstrating exceptional effectiveness and customer acceptance in such applications that are tailored to rural transportation settings. The logical architecture for these tracks has not been developed, and some applications are still in varied stages of development.

The development of a robust market fueled by private sector investment is dependent on a critical mass of basic ITS infrastructure. While in the era of ISTEA, the National ITS Program focused principally on research, technology development, and field testing, the focus of TEA-21 will continue this legacy by building on successes to deploy ITS infrastructure.

A critical challenge in achieving a seamless, intermodal transportation system is ensuring interoperability through the use of an open, non-proprietary architecture and the adoption of ITS standards.

U.S. DOT is employing several strategies to address the challenges confronting successful deployment and integration of ITS infrastructure and the development of intelligent vehicles:

- Accelerating the development of standards;
- Building Professional Capacity and providing training;
- Conducting research in infrastructure and vehicle technologies;
- Providing deployment guidance and technical assistance;
- Providing assistance for achieving consistency with the National ITS Architecture and Standards;
- Showcasing the benefits of integration in modal deployments;
- Evaluating the program.

Long Term. The long-term focus will be directed at supporting research, development and testing of advanced technologies demonstrating potential for deployment in the five-to-twenty-year horizon. The in-vehicle component of this effort will be consolidated into a single *Intelligent Vehicle Initiative* centered heavily on applying driver assistance and control intervention systems to reduce vehicle crashes. A companion effort seeks to integrate driving assistance and motorist information functions to facilitate information processing, decision making and more effective vehicle operation.

This document describes ITS projects, tests, and studies initiated through September 30, 1999, that have been partially or totally financed from Federal ITS funds. Projects identified as “Other” were earmarked activities originating during the period of ISTEA authorization. Projects identified as “Deployment/Integration” were initiated under TEA-21. However, the Completed Projects sections, which are located at the end of each chapter, include projects that were actually finished as of September 30, 1999, plus those projects anticipated to be completed by the end of December 1999. The purpose of this report is not to account for all Federal funds made available for ITS activities, but rather to describe all major projects, tests, and studies for each ITS program area. On-going projects are presented in groupings by project type in each infrastructure category and subcategory or program area. The order of presentation, to the extent that current project activity allows, starts with research and development, followed by operational tests and concludes with deployments. The completed projects are displayed alphabetically without regard to type.

Throughout this report, U.S. DOT administrations are identified as follows: FHWA -- Federal Highway Administration; within FHWA, the Office of Motor Carrier Safety (OMCS) is the proponent for Commercial Vehicle Operations projects through the end of calendar year 1999, and the Turner-Fairbank Highway Research Center (TFHRC) is the focal point for research; FRA -- Federal Railroad Administration; FTA -- Federal Transit Administration; and NHTSA -- National Highway Traffic Safety Administration. Effective January 1, 2000, the Federal Motor Carrier Safety Administration (FMCSA) will be activated and will assume sponsorship of Commercial Vehicle Operations projects. Although these organizations may not be explicitly listed as partners in projects, it is understood that at least one administration is involved in each partnership for projects operating with partnership arrangements.

II. METROPOLITAN ITS INFRASTRUCTURE

II. METROPOLITAN ITS INFRASTRUCTURE

Metropolitan ITS Infrastructure is dedicated to integrating the various components of advanced traffic management, traveler information, and public transportation systems. The principal objective of this integration is to enable the operation and management of a metropolitan area's multimodal transportation systems as a coordinated whole to provide travelers with timely and reliable information about trip planning and en-route alternatives.

In 1996, then Secretary of Transportation Federico Pena established a goal of deploying ITS infrastructure in 75 of the nation's largest metropolitan areas within ten years. This goal was reaffirmed by Secretary Slater in 1997 and was subsequently expanded to include 76 metropolitan areas. In metropolitan areas, the components of the ITS infrastructure include traffic signal control, freeway and incident management, transit management, regional multimodal traveler information systems, electronic fare payment, electronic toll collection, railroad grade crossing, and emergency management services. These components, when integrated on a common communication structure, provide an intelligent transportation infrastructure facilitating information access across agency and organizational lines. This integration substantially enhances individual functions and creates a set of public and private services that form a foundation for the evolution of the long range vision of ITS.

A major initiative in support of metropolitan area deployment goals is the Metropolitan Model Deployment Initiative Program. Four sites were selected to become deployment showcases of fully integrated, Metropolitan Intelligent Transportation Infrastructure. These model deployments will demonstrate the benefits of integrated transportation management systems featuring effective regional, multimodal traveler information services.

The ITS technologies comprising metropolitan infrastructure advanced significantly during the period of ISTEA authorization. The emphasis of research and operational testing in this timeframe was heavily focused on the problem areas severely impacting metropolitan areas: safety, congestion, and mobility. In numerous cases, systems deployed in the operational test program have resulted in quantifiable benefits, and have been incorporated as permanent elements of their areas' transportation systems.

Deployment tracking results reveal that numerous regions throughout the Nation have deployed one or more of the elements of metropolitan infrastructure. The potential for maximizing benefits of intermodal management and delivery of additional services lies in successful technical integration and interjurisdictional coordination of these elements.

The projects described in the following sections have, and are, contributing to an enhanced capability to provide integrated user services. As noted in the introduction to this document, the ITS Program has been reoriented to reflect the transition to an emphasis on deployment. Projects retain their identities as research and development, operational tests and deployments (also identified as "other" if initiated prior to July 1998, the date TEA-21 was enacted), but they have been grouped by element in the classification structure consisting of intelligent infrastructure and intelligent vehicles. In many cases, projects cut across more than one intelligent infrastructure

element such as traffic signal control projects which include major traveler information aspects and/or linkages to transit properties. The categorization was made with full acknowledgment that some projects might have been categorized differently. The Integrated Programs, Metropolitan Model Deployment Initiatives, and Priority Corridors Program inherently encompass multiple infrastructure elements.

The Metropolitan ITS Infrastructure elements are summarized as follows:

- **Traffic Signal Control** systems automate the process of adjusting signals to optimize traffic flow.
- **Freeway Management Systems** provide information to motorists and detect problems to increase capacity and minimize congestion resulting from accidents.
- **Transit Management Systems** enable new ways of monitoring and maintaining transit fleets to increase the operational efficiencies through advanced vehicle locating devices, equipment monitoring systems, and fleet management systems.
- **Incident Management Programs** enable authorities to identify and respond to vehicle crashes or breakdowns with the most appropriate and timely emergency services, thereby minimizing recovery times.
- **Electronic Toll Collection** provides drivers and transportation agencies with convenient and reliable automated transactions, to improve traffic flow at toll plazas and increase the operational efficiency of toll collection.
- **Electronic Payment Systems** enable motorists to pay for parking, bus and train fares, as well as tolls, by using a single smart card.
- **Advanced Rail-Highway Crossings**, coordinate traffic signal operations and train movements, and notify drivers of approaching trains through in-vehicle warning systems.
- **Emergency Response** is coordinated to ensure the nearest and most appropriate emergency service units respond to a crash.
- **Regional Multimodal Traveler Information** systems provide road and transit information to travelers, businesses, and truckers to enhance the effectiveness of trip planning and en-route alternatives.

During the period of ISTEA, states and localities sought to expand the effectiveness of their traffic management capabilities. Interconnection of signals and computerized signal control evolved into fully integrated, dynamically adaptive regional strategies enabling metropolitan areas to exercise proactive management of freeway ramps and arterial roadways. With advanced sensors providing a more comprehensive overview of network performance, advanced analysis, control options and advanced communications will enable multiple jurisdictions to manage their

systems and coordinate various management actions more effectively. The ultimate goal in this area is to provide greatly expanded “real-time” control capabilities which adapt to traffic movement, anticipating when and where traffic will be moving, so that signal and freeway control systems will be able to provide optimum service. In an integrated environment, traffic information will be shared among jurisdictions as well as with transit properties, travelers, businesses, and commercial carriers.

Achieving this vision will require successful completion of several key research and development efforts, testing of sensor technologies, control systems, and the integration of these systems in addition to continued support for widespread deployment of Metropolitan ITS Infrastructure in metropolitan areas across the Nation.

Building on the legacy of ISTEA, the future direction for Metropolitan ITS Infrastructure points toward continued deployment and a special focus on integration. The success of Metropolitan ITS Infrastructure hinges, to a great extent, on integrating traffic management systems, advanced public transportation systems and advanced traveler information systems.

Many research and development projects and operational tests have brought advances in understanding the approaches to, and benefits of, integrating Metropolitan ITS Infrastructure. The culmination of this effort was the establishment of the Metropolitan Model Deployment Initiative program.

One of the unique advances fostered by the ITS Program is innovation in collecting and distributing expanded information for both “pre-trip” and “en-route” travelers. The goal is to increase availability of real-time and current status of transit information. In many cases, these travel information systems are multimodal, including both roadway and transit system performance information. These sources of information enable travelers to make informed choices based on up-to-date relevant data. These capabilities can also support personal and public agency efforts to reduce demand and increase vehicle occupancy.

A key feature of many regional travel information projects is the participation of private sector companies interested in marketing traveler information. The creation of viable public-private partnerships in these projects is highly valuable, and the eventual success of such partnerships is a key goal of deployment.

The ITS Program for Public Transit encompasses a number of technologies aimed at increasing the use, operational efficiency and cost effectiveness of the services provided by public transit agencies. The scope of these operations nationwide includes approximately 6,000 agencies operating more than 100,000 vehicles. These operations support approximately 9 billion trips annually.

The Advanced Public Transportation Systems applications have been developed principally to support the needs addressed in three components of the Metropolitan ITS Infrastructure: Transit Management Systems, Regional Multimodal Traveler Information, and Electronic Payment Systems. The functional applications encompassed by these components are Fleet Management, Transit Traveler Information, and Electronic Payment Systems.

Fleet Management Systems are primarily directed at improving the operations and productivity of transit agencies and the safety of their passengers. Transit Traveler Information utilizes several technologies for the dissemination of transit information that facilitates and encourages the use of public transportation. Electronic Payment Systems focus on integrating transportation payment systems to improve traveler convenience and reduce operating costs.

The operational tests described in the Metropolitan ITS Infrastructure section, with headers identifying them as Transit Management Systems-related, encompass the technologies addressed above. These operational tests are designed to evaluate varying technologies in terms of their effectiveness in improving transit operations and evaluating the consumer acceptance and benefits of a variety of techniques to encourage the use of transit.

In addition to operational tests, there have been a number of full-scale deployment projects employing ITS technologies. These have been concentrated in Fleet Management Systems derived from earlier operational test/deployment results and the Federal Transit Administration's research and development program.

Several companies currently use transit fleet management technology applications based on receiving Global Positioning System signals to perform automatic vehicle location integrated with computer-aided dispatch system to provide real-time fleet management of buses and paratransit vehicles. In excess of 25 transit agencies either have, or are in the process of deploying such fleet management systems. The motivation for these initiatives is found in the significant benefits to be derived in improved passenger safety, reduced operating costs, and improved customer service resulting from enhanced schedule adherence. Some operational tests build on deployed automatic vehicle location systems to reap the benefits of integration with sources of traveler information, traffic management centers, and other components of metropolitan infrastructure.

Another important activity in many transit properties, including several operational tests, is to test new ways of giving the traveling public transit information. Transit operators are well aware that the traditional printed schedule is difficult to read and a disincentive to the use of public transit. A wide variety of techniques are being tested to determine how to communicate to the public and to increase the number of people using transit. These technologies span a broad range of approaches because one technique will not serve all segments of the riding public.

Effective implementation of travel management improvements through use of ITS cannot be fully achieved by implementing stand-alone projects. Especially in metropolitan areas, an integrated program of linked, complementary projects covering areas such as traffic control, freeway and incident management, transit management, and traveler information is necessary to maximize benefits while minimizing costs. Transit operators are striving to provide customers and potential customers reliable, accurate, and timely information. To date, several of these integrated programs have been supported with Federal ITS funds, as described in this chapter under "Integrated Programs." These programs are more comprehensive in scope, size, and objectives than individual projects, yet they do not fall into the very specific categories of Priority Corridors or Model Deployment Initiatives identified below.

Priority Corridors Program

The Intermodal Surface Transportation Efficiency Act of 1991 established criteria for the ITS (then IVHS) Priority Corridors; and U.S. DOT followed with designation of four corridors, which are:

- the I-95 Corridor (including Connecticut, Delaware, the District of Columbia, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont, and Virginia);
- the Midwest Corridor (Gary, Indiana, to Milwaukee, Wisconsin);
- Houston, Texas; and
- Southern California (Los Angeles to San Diego).

As described in the following sections, the organizations carrying forward the program within each of these four areas have developed business planning processes and have initiated extensive programs of projects. The programs in these four areas are building toward integrated transportation management and traveler information systems, and incorporate a wide range of ITS technologies and services. In addition, the institutional relationships that have been developed and strengthened through the initiation of the Priority Corridors Program has led to enhanced working relationships among traffic, transit, and other entities across jurisdictional boundaries.

Model Deployment Initiatives

To support moving ahead with greatly expanded deployment of ITS using regular Federal-aid and other state/local funding, the U.S. DOT initiated the Model Deployment Initiative. The metropolitan area Model Deployment Initiatives are intended to support integrated transportation management systems, and feature a strong, regional, multimodal traveler information services component. These model deployment sites will demonstrate and showcase the measurable benefits resulting from the application of an integrated, region-wide approach to transportation management and the provision of traveler information services. The model deployment sites will provide improved transportation management and increased levels of service to the traveling public, businesses, and commercial carriers through the integration of the traditional functions of traffic signal control; transit, freeway, and incident management; emergency services management; regional, multimodal traveler information services; and electronic toll and fare payment. In addition to introducing the public to the benefits of ITS products and services, the sites will serve as “showcases” for key local decision makers across the U.S., and will support peer-to-peer interaction and seminars focused on the benefits of ITS infrastructure investments by both the public and private sectors. The model deployment sites also will provide a setting for conducting rigorous evaluations of the benefits of an integrated metropolitan area ITS infrastructure.

A major component of TEA-21 is the Intelligent Transportation System Integration Program which places emphasis on integration of ITS infrastructure components in metropolitan and rural areas. A consequence of this emphasis is that many projects supported by Federal ITS funding are focused on integration. Thus, in addition to the initiatives discussed above, projects will be grouped under statewide and/or regional integration categories. In cases where ITS integration

projects do not cover wide geographic areas, they are categorized as individual projects under Integrated Systems.

Traffic Signal Control

ARIZONA CENTER FOR TRAFFIC AND LOGISTICS ALGORITHMS & SOFTWARE (ATLAS)

Description:

This project will utilize a steering committee comprised of state, local and Federal participants who will develop a work plan for Metropolitan and Rural Intelligent Infrastructure research on traffic and logistics issues. The committee will oversee the management and conduct of the research so as to complement the FHWA intelligent infrastructure research program. There will be a focus on real-time traffic control software and on development of logistics software.

INTEGRATED RAMP METERING/ADAPTIVE SIGNAL CONTROL

Description:

This project will evaluate the operational effects of balancing traffic flow between I-5/I-405 and the parallel arterial streets. The project will also demonstrate the effectiveness of collaborative action on the part of transportation management agencies to optimize their strategies to improve traffic flow. The project will integrate an existing centrally-controlled freeway ramp meter system with an arterial signal system consisting of existing signal controllers, the new Advanced Traffic Controller, and an adaptive control algorithm (OPAC).

NORTH SEATTLE ADVANCED TRAFFIC MANAGEMENT SYSTEM

Description:

This project will explore methods for adjacent traffic signal systems to share loop detector and operational data to improve operations across boundaries and between adjacent systems. Jurisdictional issues which often prevent coordinating adjacent systems will be addressed during this project. Data will be obtained from several systems in the I-5 corridor north of Seattle by a single microcomputer connected with street or central master controllers belonging to the various jurisdictions within the corridor. The microcomputer will compile the volume, occupancy and operations data and transmit it back to the participating control systems. Each system will then use the data to improve its traffic management capabilities.

BROOKLYN-BRONX-QUEENS SIGNALIZATION

Description:

This project supports the development, installation and evaluation of new, advanced traffic controllers (ATC) for integration into the signal system for New York City's five boroughs. The project will develop controller prototypes, field test hardware and software, and evaluate system performance before installing additional ATCs at various locations around the City. The development of the controller prototype specification will be completed under the Topics program using \$0.2M of city funds. After the specification was completed (March 1999), the city will develop a separate contract to furnish and install the new controllers at approximately 500-1000 intersections. ITS funds will be used for the installation contract.

Project Location:

Brooklyn and Bronx, New York

HUNTINGTON BEACH, CA I-405 MULTI-JURISDICTIONAL SMART CORRIDOR AND CALTRANS DISTRICT 12 INTERTIE PROJECT

Description:

This project is comprised of the design and deployment of several ITS elements in the cities of Huntington Beach, Fountain Valley and Westminster, California along the I-405 corridor. Key technology components include fiber optic communication to support traffic signals and closed circuit TV, vehicle detection stations and video image processing systems. The fiber optic backbone will support a high speed communications link between Caltrans District 12 and Huntington Beach along I-405. These features will be complemented by design and implementation of integrated workstations and graphical user interfaces to support improved operation of the three cities' traffic signal systems, CCTV cameras and shared information links between Huntington Beach, Westminster and Fountain Valley.

JACKSON, MISSISSIPPI INTELLIGENT TRANSPORTATION SYSTEM IMPLEMENTATION

Description:

This project is the result of long range planning and inter-agency cooperation. The first elements of the Jackson Metropolitan ITS were deployed in 1994. City bond money and State planning funds have been used to expand the system over the past six years. The City has a Traffic Management Center (TMC) which controls 156 signalized intersections with video surveillance at ten intersections. The Mississippi Department of Transportation (MDOT) also has a TMC that will be integrated to the Jackson TMC.

This integration to the MDOT TMC will add coverage to seven additional City-maintained traffic signals. The City will gain access to a video surveillance camera on the main approach to the Jackson Municipal Airport located outside of the city limits. MDOT will be able to monitor all of the traffic signals on the City system. All ten video cameras will be shared with MDOT giving them the ability to monitor a good portion of I-55 on the north side of Jackson. Additionally, the integration of the State and City centers will also allow the implementation of the early stages of incident management.

TEMECULA, CALIFORNIA I-15 TRAFFIC SURVEILLANCE AND SIGNAL SYSTEM INTEGRATION PROJECT

Description:

The primary goals of this project are to support existing and future economic and community development without a major increase in traffic congestion and delay along the I-15 corridor and on the city's major arterials. The project will design and install four closed circuit TV cameras (CCTV); design and install a communications system between the CCTV and the city's Traffic Operations Center (TOC), and install the necessary integrated workstation/graphical user interface to integrate, control and monitor the traffic signal system, the surveillance system and freeway variable message signs. Also included is a communication intertie between the city's TOC and Caltrans District 8.

Project Location:

Temucula, California

Partner(s):

City of Temecula, California

TUCSON, ARIZONA INTEGRATION OF REAL-TIME TRAFFIC INFORMATION FOR ADAPTIVE SIGNAL CONTROL, TRAVELER INFORMATION AND MANAGEMENT OF TRANSIT AND EMERGENCY SERVICES

Description:

In the last few years the Systems and Industrial Engineering Department at the University of Arizona (UofA) has been involved with several ITS projects including operational testing of traffic adaptive signal control and research/development of innovative approaches to real-time prediction of traffic conditions and transit priority. This proposed project will integrate many of the results and findings from these projects. In particular, the UofA and its partners/collaborators will integrate available real-time traffic information from loop detectors and other sources for real-time traffic-adaptive signal control, for real-time traffic prediction for traveler information, for adaptive signal priority for transit vehicles, and for pro-active coordination of signal phasing to provide preemptive pathways for emergency vehicles.

This project consists of five sub-projects: Development of an ITS strategic deployment plan and an architecture that allows for the integration of the required real-time information; Deployment and integration of a real-time traffic prediction method for traveler information systems; Deployment and integration of a real-time traffic adaptive signal system for a grid of intersections; Deployment and integration of transit signal priority for an arterial; and Deployment and integration of route advisory and limited traffic signal coordination/preemption for emergency vehicles.

WHITE PLAINS-WESTCHESTER COUNTY, NEW YORK INTEROPERABLE COORDINATED SIGNAL SYSTEM

Description:

This project will establish an interoperable coordinated signal system (ICSS) on adjoining New York State arterials and existing coordinated signal systems owned and operated by the City of White Plains and the County of Westchester in the White Plains urban area. This project aims to create a unified, interoperable coordinated signal system that integrates city, county, and state signal subsystems. Each subsystem will be autonomous, but will be interconnected for operations as a single system when required.

Project Location:

White Plains, New York

Partner(s):

ATMS RESEARCH ANALYSIS DATABASE SYSTEM

Description:

The objective of this effort was to develop a means of integrating disparate traffic engineering tools through the use of a common data dictionary and database system. The set of software tools that could use this system include ATMS research software and traffic engineering analysis tools. This effort concentrated on developing the data dictionary, building a database designed around that dictionary, and modifying a small number of existing programs to use that database system.

The proposed system, the ATMS Research Analysis Database System (ATMS RADS), provides a standard data dictionary to be used for storage and retrieval of data used by ATMS and traffic engineering software. This project also uses a proof-of-concept development to demonstrate that this standard data dictionary and database system are useful to a variety of existing programs.

DATABASES FOR ASSESSMENT OF OPERATIONAL TESTS AND TRAFFIC MODELS

Description:

This study involves defining data required for the validation and verification of traffic models. This study will also include the collection and storage of traffic data from different sites strategically selected around the country and the subsequent maintenance of the databases. Additionally, issues will be addressed including type of storage needed (central vs. distributed), hardware and software platforms, and user interfaces (pre - and post-processing activities). Some of this data will be obtained from existing data sources or on-going ITS field operational tests. Special emphasis will be placed on data collection from the field testing of Real Time-Traffic Adaptive Control Systems. The verification and validation techniques and database management system will be applied to FHWA's TRAF family of models.

HUMAN FACTORS COMPUTER - AIDED DESIGN TOOL FOR TRAFFIC MANAGEMENT CENTERS

Description:

The effective design and modification of traffic management centers will benefit from easily accessed design tools and information which facilitate a human factored design. The Computer - Aided Design Support System (CADDs) tool developed in this project will include human factors guidelines for the design of traffic management centers, access to TMC research specific to operator issues and other tools which assist the designer in achieving optimal usability of TMC equipment. Efficient tool access will be achieved via rapid retrieval and tool centralization. CADDs will provide appropriate tools (e.g., design guidelines) and information at the appropriate design steps and phases without extensive searching through large volumes of data.

HUMAN FACTORS IN ADVANCED TRAFFIC MANAGEMENT SYSTEMS (ATMS) DESIGN EVOLUTION

Description:

The goal of this study is to investigate and define the human factors issues involved in a fully functional, state-of-the-art Advanced Traffic Management System (ATMS). Products of this effort include the development of a Human Factors Handbook for Traffic Management Center (TMC) Designers, a human-centered engineering analysis of an advanced traffic management center, a database of TMC human factors research and a stand-alone human factors research TMC simulator.

Products from the requirements analysis include second generation scenarios and systems objectives, definition of system functions, allocation of functions, operator performance requirements, task analysis and human factors design guidance. The Comparable Systems Analysis has been published by FHWA. The First Edition Human Factors Handbook of Traffic Management System Design has been published. The human factors studies in the experimental program have begun and are in various stages of completion.

BRONX/NORTHERN MANHATTAN ATMS

Description:

This project has two parts:

Part 1: Transmit Expansion - This project will expand TRANSCOM's Transmit Program into Bronx County. Approximately 18 reader locations that will be capable of communicating with the E-Z Pass tags will be installed on various highways in the Bronx for traffic data collection purposes.

Part 2: Systems in the State/City Traffic Management Center (TMC) (2 projects) - This program will construct an interim and permanent traffic control center for New York State DOT in the Long Island Corridor. This first project will cost \$0.5M and was expected to be completed in early 1999. The second project (for the permanent center) will cost \$1.7M and is scheduled for construction in early 2000 with completion of construction in June 2002.

I-90 CONNECTOR, RENSSELAER COUNTY, NEW YORK

Description:

The FY 1998 Rensselaer County earmark of \$1.25M for Rensselaer County has been divided into two projects. The Rensselaer Polytechnic Institute (RPI) will receive \$500K to develop ITS training and the remaining funds (\$750K) will be used for ITS research to support the I-90 Connector/Test Bed. ITS Test Bed Research--This project will fund ITS research on a 3-mile, in-situ test bed facility on the Rensselaer County, I-90 Connector. The ITS research will include: investigation of communications technologies to link the test bed with the soon-to-be opened Northway Incident Management/Traffic Operations Center, traffic operation data collection, deployment of temporary ITS equipment in the study area, and the establishment of partnerships with educational institutions and/or private sector ITS firms. Rensselaer Polytechnic Institute in coordination with the FHWA Professional Capacity Building Program will use advance education technologies to design, develop and deploy educational modules on ITS topics in a variety of settings. The target audience for this new training is ITS professionals. Course topics to be addressed are wireless communications, the operations of a traffic management center, and video detection and surveillance technologies. All of the education modules will be designed to be delivered (1) in face-to-face classroom settings, (2) individual learning via either the Web or CD ROM and (3) using distance learning technologies such as video conferencing and interactive web work.

Project Location:

Rensselaer County, New York

Partner(s):

KANSAS CITY REGION INTEGRATED AUTOMATION SYSTEM DEVICES

Description:

The objective of this project is the deployment of Integrated Automation Management System Devices (computer hardware) for the new Traffic Operation Centers (TOC) in the Kansas City Region. These devices will serve as the central processing units for the Kansas City Region. The operations of Freeway, Incident and Corridor Management Subsystems will be controlled through these devices. Center-to-center communications between other region partners (emergency services, transit, information service providers, etc.) and other midwest cities (Illinois, Kansas, Iowa, Nebraska, etc.) will result as part of sharing regional transportation information.

Project Location:

Kansas City Region

MOBILE, ALABAMA ITS INTEGRATION

Description:

The goals of this project are the development of integrated, National ITS Architecture - compliant Freeway Management and Incident Management systems and the planning for follow-on integration and deployment of Metropolitan ITS infrastructure.

The objectives of a freeway and incident management system which would apply to the Mobile area are to effectively perform such functions as surveillance and incident detection, information dissemination, and coordination with other traffic and freeway management systems and incident detection. Mobile has several building blocks of these components already in place but require an integration approach in bringing these elements together to work in a unified manner. Two key components need to be implemented in Mobile: additional field and communication equipment. For example, the regional traffic management center in place does not have the necessary equipment for monitoring the appropriate arterials to aid in the dissemination of traveler information and provide surveillance and incident detection. Also, since the Mobile area has had only one ITS-funded project deployed, the Fog Detection Project, the purchase of additional equipment is critical to create a regional ITS architecture to support integrated ITS deployment.

The ITS integration plan will be developed as a long-range plan describing how the existing systems can come together, and by utilizing the National Architecture, to form a regional architecture through the use of market packages. The plan will be able to set both short-term and long-term goals and objectives. Market packages such as Network Surveillance, Incident Management, and Traffic Information Dissemination can provide useful information by linking agencies and informing the public through user services. User services can include identifying scheduled/planned incidents (e.g. construction activity), detect incidents, formulate response actions, support initialization of response actions (Mobile County Emergency Management Center), and predict hazardous conditions.

Project Location:

Mobile, Alabama

MONITOR

Description:

MONITOR is Milwaukee's Freeway Traffic Management System. The MONITOR build-out is a \$40 million investment in the Operations of the Milwaukee Area Freeway and Arterial System. FY 1998 funding will contribute to MONITOR Stage VI Construction, MONITOR Software, and the Traffic Incident Management Enhancement Program. MONITOR Stage VI will implement various equipment that was not placed in operation during the five previous stages, including the last 15 of 120 ramp meters. An Independent Software Advisor will assist in the oversight and direction of all TOC software development activities. MONITOR Software will be upgraded to make the existing system year 2000 compliant. Stage A of the MONITOR Software Upgrade will be funded, including the software coding for the Regions' Traveler Information HUB. New Enhanced Freeway Patrol Service will begin in Washington, Ozaukee and Waukesha Counties, and existing service patrols will be expanded in Racine and Kenosha Counties.

NEVADA ARCHIVED DATA SUBSYSTEM COMPONENT OF LAS VEGAS AREA FREEWAY AND ARTERIAL SYSTEM OF TRANSPORTATION

Description:

This project will conduct a detailed design of an archived data subsystem to be integrated with the Las Vegas Area Freeway and Arterial System of Transportation (FAST). The archived data design will provide the capability to receive, collect, retain and distribute data generated by ITS for use in other transportation activities by all stakeholders in the region. FAST is a multimodal, multi-jurisdictional integrated traffic management and traveler information system. Initially, the FAST system will include the following user services: Traffic Control; Incident Management; En-route Driver Information; Pre-trip Traveler Information and the Archived Data User Service (ADUS) to be implemented in this project. Major components of the ADUS will include: data processing; data storage; data retrieval; and implementation of privacy procedures.

SPRINGFIELD, VIRGINIA INTERSTATE INTERCHANGE

Description:

This integration project addresses one aspect of the integration of infrastructure in the Springfield Interstate improvement project. The ITS integration component to be addressed is the enhanced use of video imagery to include video transfer between agencies and organizations. The specific project focus is to provide video feeds between existing VDOT Smart Traffic Centers and others, such as the Fairfax County Public Safety Dispatch Center and the Springfield Interchange Office of the State Police.

A smaller, companion effort to this video sharing initiative is to ensure that the existing incident management plan and manual are current and up-to-date. A review of the existing regional plan and manual will be conducted to determine any needed revisions, especially as they may relate to the Springfield Interchange project and video sharing.

STATE OF TEXAS STATEWIDE SOFTWARE AND SYSTEMS INTEGRATION CENTER-TO-CENTER COMMUNICATIONS PROJECT

Description:

This is a multi-phase project started in February 1999. Phase I of the Center-to-Center Communications (C2C2) Project, when deployed will provide data on freeway conditions on a graphical map for a combined Dallas/Ft. Worth ITS internet web site. Phase II of the C2C2 pilot project will extend the data server capabilities beyond freeway conditions to support coordinated incident management, information sharing, and remote device monitoring and control. The final phase of the project is intended to deploy an effective, reusable and fully interoperable C2C2 system in other ITS regions throughout Texas. This final phase will include additional development and integration activities to extend the multi-modal, multi-center and interoperable capabilities of the data server and related subsystems.

Transit Management Systems

COMPUTER INTEGRATED TRANSIT MAINTENANCE AND ENVIRONMENT (CITME)

Description:

The project, funded in previous years, will provide transit properties with the tools to assist in modernizing their maintenance operations. This \$1 million earmark will be used to implement the system designed in Phase I in the bus operations area. The functional specifications for this system have been developed by a research team led by South Carolina Research Associates (SCRA) for installation at the Greater Cleveland Regional Transit Authority's bus and rail maintenance facilities. SCRA expects that CITME will reduce the costs of transit maintenance by 15-25 percent. Current funding will be used to procure software/hardware necessary to install ITS systems in Cleveland's bus operations division. Funding for the third phase, if available, will be used to procure and/or design hardware/software for rate and facilities operations.

Project Location:

Cleveland, Ohio

Contractor(s):

Greater Cleveland Regional Transit Authority, South Carolina Research Associates (SCRA)

Start Date:

October 1997

CHICAGO SMART INTERMODAL SYSTEM

Description:

The Chicago Transit Authority (CTA) is deploying their Bus Emergency Communications System (BECS) and Bus Service Management System (BSMS). The BECS is a comprehensive communications base designed to support more effective delivery of bus service. New two-way voice and data radio system, and location capabilities are the main features of BECS. Under the BSMS, CTA is installing additional hardware and software modules to support Computer-Aided Dispatch (CAD) software, transit priority movements at five signalized intersections, electronic traveler information way-side signs at two major bus stops, and enhanced data reporting system. Modules are being installed only on buses assigned to the 77th street garage.

Project Location:

Chicago, Illinois

DALLAS AREA RAPID TRANSIT PERSONALIZED PUBLIC TRANSIT

Description:

Dallas Area Rapid Transit (DART) is testing flexible-route buses on a regional cross-town route in the Dallas metropolitan area to determine if flexible service can increase ridership. By integrating DART's existing Automatic Vehicle Location (AVL) system and an off-the-shelf Computer Aided Dispatch (CAD) software, slack in a bus' schedule can be calculated. If there is sufficient slack, a fixed-route bus may deviate and pick up off-route passengers at a designated location. DART's Geographical Information System (GIS) is used to identify the exact location of the off-route passenger pick-up point. The maximum route deviation is one mile.

Project Location:

Dallas, Texas

Partner(s):

Dallas Area Rapid Transit (DART), University of Texas at Arlington, and Texas Southern University

SMART FLEXROUTE INTEGRATED REAL-TIME ENHANCEMENT SYSTEM (SAFIRES)

Description:

The Potomac and Rappahannock Transportation Commission (known as OmniRide - A ride for All Reasons) is conducting an operations test to evaluate an integrated smart vehicle service that includes route-deviation, fixed route, and demand responsive service types. The test site is a suburban-to-rural environment in the Prince William area of Virginia, located twenty-five miles south of Washington, D.C.

Using Intelligent Transportation Systems (ITS) technologies including a global positioning satellite-based (GPS) automated vehicle location (AVL) system, real-time scheduling software, geographic information system (GIS) mapping, and digital communication through mobile data terminals (MDT), the test will integrate route deviation, commuter rail and bus, feeder bus, and human service transportation in a low density environment.

Small, multi-purpose vehicles will switch between service types on an as-needed basis, allowing the best vehicle to respond to each request in real-time using the integrated computerized dispatching software developed for the operational test. ITS technologies will also greatly simplify section 15 reporting and tracking human service ridership and agency charges. It is hypothesized that this system will provide greater effectiveness and efficiency in serving the public transportation needs of the community than would be the case in a non-ITS enhanced environment.

Route deviation (up to 3/4 mile) will enable the service to reach a far larger market and negate the need for complementary paratransit services required of fixed route systems. The test, expected to involve up to 50 ITS enhanced vehicles and a dispatching center, is scheduled to last 30 months. It is anticipated that full deployment of ITS technologies will begin in early 1996.

Project Location:

Northern Virginia

Partner(s):

Potomac-Rappahannock Transportation Commission (PRTC), Northern Virginia Planning District Commission (NVPDC), Virginia Department of Rail and Public Transportation (VDRPT), GMSI, Inc., Trapeze Software, Inc., and SG Associates

Start Date:

January 1994

SUBURBAN MOBILITY AUTHORITY FOR REGIONAL TRANSPORTATION (SMART) PROJECT

Description:

Project activities will provide for a Dispatch System with automated reservations, scheduling and dispatch for paratransit operation, and an Automatic Vehicle Location (AVL) system to allow tracking the fleet. These capabilities will eventually be extended to affiliated agencies. The project will also establish an 800 number, interfaced with the dispatch system with potential to refer customers to regional paratransit services. The project will also develop interfaces with other ITS initiatives in the region, including FAST-TRAC and Michigan DOT's Metropolitan Transportation Center. The project will also provide for innovative Traveler Information Services, to tie other uses together.

Project Location:

Detroit, Michigan

Partner(s):

Suburban (Detroit) Mobility Authority for Regional Transportation (SMART) and Michigan DOT

Start Date:

February 1994

End Date:

March 2000

WINSTON-SALEM MOBILITY MANAGEMENT - PHASE II

Description:

This project supports research that supports the implementation by the city of Winston-Salem, NC, of mobility management service throughout the city's paratransit fleet of nineteen (19) vehicles, and to link the mobility management service to the city's 58-vehicle fixed-route bus service. Mobility management services and system specifications are being defined for the coordination of paratransit and fixed-route transit. Hardware and software is being obtained and installed for operational testing.

Project Location:

Winston-Salem, North Carolina

Partner(s):

Winston-Salem Transit Authority (WSTA), City of Winston-Salem, North Carolina DOT, and North Carolina State University's Institute for Transportation Research and Education

Start Date:

June 1996

End Date:

August 2000

ARLINGTON, VIRGINIA TRANSIT PRIORITY AND EMERGENCY VEHICLE PREEMPTION

Description:

The principal goal of this project is to improve the capacity and increase operational efficiency of the Transit Priority and Emergency Vehicle Preemption system along Columbia Pike and elsewhere in the County as funding allows. In addition, the project will allow the expansion of SCOOT traffic control along major traffic corridors. By reducing congestion and providing reliable information for travelers to make better travel decisions, effective capacity and efficiency are enhanced and environmental impacts reduced.

Flexible and integrated system is the crucial element of this project. The objective of this project is to ensure the harmony of public transit system along jurisdictions. Columbia Pike corridor links Fairfax County with Arlington County. Public transport will benefit greatly from the integration of systems. Transit agencies can provide faster, convenient, safe and flexible services with this system. Based on a bus performance relative to schedule and the vehicle's planned route, plus the destinations and connection requirements of the passengers, traffic signal timing can accommodate the schedule needs. A special green wave to get the bus back on schedule can be implemented. Using a seamless transit system in the region enhances the mobility and safety of the operation.

Personal mobility and convenience will be enhanced and the new control system will increase transit automation and predictability. The ability to use energy more efficiently and reduce environmental costs through the use of advance technology will be achieved effectively. More efficient system reduces travel times and more efficient administration of the transportation system enables productivity gains across the system.

CLEVELAND, OHIO TRANSPORTATION MANAGEMENT AND INTEGRATED COMMUNICATIONS CENTER

Description:

The objective of this project is to design and build a traffic and transit management and communications center that will house operations of the Greater Cleveland Regional Transit Authority, Cuyahoga County emergency services and Ohio DOT. The long range plan is to locate Ohio DOT freeway and incident management centers as well as a regional signal coordination system at the communications center.

Project Location:

Cleveland, Ohio

Partner(s):

Ohio DOT, Greater Cleveland Regional Transit Authority (GCRTA), Cuyahoga County

Start Date:

September 1999

End Date:

December 2000

**Estimated Total

COLUMBUS, OHIO ITS INTEGRATION - PHASE I

Description:

This project constitutes part of Phase I of a regional ITS infrastructure deployment and integration plan. Phase I includes deployment of a traffic signal prioritization system on a portion of the Central Ohio Transit Authority's main routes and assessing the effectiveness of the system. Real-time transit information will be provided in selected central business district bus stop locations. Inherent in this real-time component is the installation of an automated vehicle locator (AVL) system on a portion of the Authority's fleet. The AVL system will be utilized for both the signal priority and the real-time transit information systems.

Project Location:

Columbus, Ohio

Partner(s):

Central Ohio Transit Authority, City of Columbus, Ohio DOT, Mid-Ohio Regional Planning Commission, Columbus Airport Authority

Start Date:

May 1999

End Date:

October 2001

RIVERSIDE COUNTY TRANSIT ITS DEMONSTRATION

Description:

The Southern California Association of Governments (SCAG) in association with the Riverside County Transportation Commission (RCTC), the Riverside Transit Agency (RTA), and SunLine Transit Agency have developed a demonstration program which will test the application of ITS technologies for providers of public transportation. Specifically the goal of this demonstration will be to test ITS system applications on transit operations, establish the standards and criteria for open environment technology, assess transit operational productivity increases from such applications, evaluate cost effectiveness, and identify the means, methods and actions required to implement and integrate ITS technologies into traditional fixed route transit, demand responsive transit, and non-traditional transit services such as smart shuttles. The demonstration has three primary objectives: (1) Enhanced customer information (which integrates customer information with system dispatching through the use of real-time information); (2) Fare collection and operational performance (through the use of telemetric monitoring of on-route/time performance and ridership can be gathered in real-time); (3) Vehicle telemetry (automated monitoring of critical vehicle safety and maintenance systems). The FY 99 Integration Program funding will be used to fund the demonstration program which will test and quantify system-wide transit productivity improvements.

WESTCHESTER/PUTNAM COUNTIES, NEW YORK REGIONAL TRANSIT OPERATIONS INFORMATION INTEGRATION

Description:

This project will develop and improve the multi-agency integration of information and communications systems to support effective use of Advanced Public Transportation Systems for multi-agency transit service coordination. Implementation of the Transit Communications Interface Profiles (TCIP) will establish the foundation for providing a schedule database maintenance system (SDMS), provide for multi-agency interoperability using SDMS and other legacy regional transit schedule maintenance software, create an AVL integration/coordination test-bed, and incorporate the exchange of TCIP compliant transit operations information.

Project Location:

Incident Management Systems

LAW ENFORCEMENT INTELLIGENT NETWORK SYSTEMS

Description:

The project objectives are to design and build a system that allows end-to-end data communication among Alliance members. The system consists of an Officer Assistant and Patrol Car Assistance connected by an Internet communications network. The proposed implementations will increase officer safety, improve mobile communications, enhance data sharing, and promote financial and life cycle efficiency of law enforcement communications technology. Both hardware and software will be designed in a modular fashion, using intelligent systems approaches and as far as possible, to use commercial off the shelf (COTS) components. The proposed units used by the officer in the field will be able to place relevant information near at hand to a variety of data sources. This is achieved by developing the units in an evolutionary manner through a series of levels starting with low bandwidth and at each phase increment, to increase bandwidth and graphical data transmission capability. This conforms with the ITS Guidelines in that the communications technology is separate from the architecture, allowing evolutionary advances as technology advances. ITS activities in Incident Management and Emergency Management will be high priority categories. As long as this path is standards based, not only will communication and cooperation among the Alliance members be enhanced, but a replicable model for other parts of the state and nation will be established and become the model for law enforcement technology overall.

Project Location:

University of Alabama, Huntsville

NEW JERSEY POLICE COMMUNICATION CENTER

Description:

The purpose of this project is to establish a prototype law enforcement communications/patrol center on a site adjacent to the New Jersey Turnpike. The center will be capable of receiving traffic information and real-time VMS displays from the Turnpike's existing Automated Traffic Surveillance and Control System. The center will have the capability of disseminating this information to patrol vehicles via mobile data terminals (MDTs). The goals and objectives of this project include enhanced traffic management capability, improved response to incidents, improved efficiency of enforcement functions and improvement of the institutional relationship between State Police and traffic operations personnel.

Project Location:

New Jersey

NORTHERN VIRGINIA REGIONAL FARE SYSTEM

Description:

This project supports the efforts of the Northern Virginia Transportation Commission to design a Regional Fare System. The system will integrate the fare collection operations of separate commuter rail, bus, and rail-commuter operators. The project follows on the Washington Metropolitan Area Transportation Authority's decision to implement the recently demonstrated "Go Card" throughout Washington, DC's Metrorail system. Building on this successful demonstration, this project will assist the transportation agencies of the Washington, DC area to integrate their transit fare and transportation payment systems.

Project Location:

Northern Virginia

Partner(s):

Northern Virginia Transportation Commission, Washington Metropolitan Area Transportation Authority

Start Date:

June 1997

End Date:

May 2001

WILMINGTON, DELAWARE SMART DART

Description:

This project was designed to operationally test smart card technology in a transit application in Wilmington, Delaware. A smart card fare collection system was to be developed for the Wilmington bus fleet. An Employee Commute Option (ECO) program was to be created that allowed employers to provide transit benefits through the smart card system which facilitates the administration of transit benefits. The ECO program was developed as a response to the Clean Air Act of 1992, and the program was intended to allow participating employers to qualify for the tax credits based on the level of employee participation in the program. The smart card was to be issued by a local bank as part of a larger pilot program testing an open-system stored-value bank card. The project, under this design was not initiated, and it is currently being redefined.

Project Location:

Wilmington, Delaware

Railroad Crossings

RAILROAD CROSSING VEHICLE PROXIMITY ALERT SYSTEM

Description:

The Vehicle Proximity Alert System (VPAS) is designed to warn drivers of priority vehicles (emergency vehicles, school buses, hazardous material haulers) about the presence of approaching trains at highway-rail grade crossings. This alert is activated via an in-vehicle warning (audio/visual). Testing and evaluation of several selected prototype systems for system performance and reliability have been completed. This was accomplished at the Transportation Technology Center (TTC) test track facilities in Colorado. No further testing is required on these prototype systems and an evaluation report is in development with an expected delivery date of end 1st Qtr. CY 2000.

Project Location:

Pueblo, Colorado

Partner(s):

Smart Stops Unlimited., Inc., E.A.R.S., Dynamic Vehicle Safety Systems and the Federal Railroad Administration

Regional Multimodal Traveler Information

ANALYSIS OF TRAVELERS' PREFERENCES FOR ROUTING

Description:

One strategy for using the roadway effectively is to provide traffic status information to assist travelers' route planning and scheduling. This expanded knowledge of options for departure time and route choice and rerouting will create a more effective use of the roadway infrastructure.

It is important for message providers to know which kinds of message content and format are sufficiently convincing to influence traveler decision making. One purpose of this project is to identify factors which influence decision criteria for departure times, routing and rerouting decisions particularly in commuting situations.

Empirically derived results bearing on these issues will be provided in at least two forms. One form will be a human factors handbook which furnishes guidance for the design and transmission of messages primarily for Advanced Traveler Information Systems. Empirical results will also be used in the development of realistic estimates of driver behavior needed for traffic models.

A literature review of driver information requirements has been performed. Research nearing completion includes human factors and traffic engineering laboratory analyses of information requested during traffic congestion.

DYNAMIC TRAFFIC ASSIGNMENT AND SYNTHETIC ORIGIN AND DESTINATION MATRICES

Description:

This study will develop a deployable Real-Time, Traffic Estimation and Prediction System (TrEPS). The system shall be able to serve as an effective integrator between ATMS and ATIS and shall be deployable in real time in a large and congested network in which recurrent and non-recurrent congestion may occur. A TrEPS system should have the following broad functional capabilities:

- Estimate and predict traffic network states;
- Provide route guidance;
- Offer departure time and mode choice (e.g., transit vs. auto) advisory to travelers;
- Interface to traffic control systems.

A real-time TrEPS system will perform the above functions in real-time by making the best use of the information collected from surveillance systems and other information sources including ATIS.

The project is to be conducted in multiple phases. Phase I work focuses on the design, development, functional testing, and laboratory testing of the TrEPS system. Upon completion of Phase I, Oak Ridge National Laboratory (ORNL) will conduct an independent evaluation of laboratory software acceptance evaluation; a traffic management center evaluation of TrEPS; and a metropolitan planning organization evaluation of the planning version of TrEPS. Phase II work will focus on computational and system integration issues for real-time operations in a traffic management center. Phase III work will perform small scale experimental field testing to evaluate the robustness of TrEPS and enhance the system for integration with wide-area surveillance.

Two parallel Phase I research contracts were awarded to Massachusetts Institute of Technology and the University of Texas at Austin through ORNL in October, 1995. Both Phase I projects were completed by October 1998. Work on prototype evaluation is underway.

ORNL provides technical management support to the FHWA with the design, development, and testing of the DTA system.

HOUSTON SMART COMMUTER

Description:

In the I-45 North Corridor, Metro is trying to entice travelers from Single Occupancy Vehicles (SOV) into buses by providing real-time transit and traffic information through personal digital assistants. Seven hundred test and control subjects are participating in the project. Metro is evaluating the test every six months.

In the I-10 West Corridor, Metro is trying to entice travelers from SOV into car and vanpools by providing a ridesharing service. During the first six months of testing, telephone operators assist in matching drivers and riders. After this phase, the project is evaluated. If successful, Metro plans on installing an automated ridesharing service.

LYNX PASSENGER TRAVEL PLANNING SYSTEM

Description:

This cooperative agreement is to support the efforts of the Central Florida Regional Transportation Authority (LYNX) to develop a transit component for their Passenger Travel Planning System. The project will develop a traveler planning center and install electronic bus stop displays and a vehicle location system, integrated with an existing signal pre-emption system. Electronic emitters will be installed in transit buses and will be read by existing electronic detectors at signalized intersections. The vehicle data will be relayed from the intersection to the Transportation Management Center, and to the transit operator, who will provide next-bus information to customers through bus stop displays. Vehicle data will also be used to monitor transit fleet performance and improve service.

Project Location:

NEW YORK CITY METROPOLITAN TRANSPORTATION AUTHORITY TRAVEL INFORMATION SYSTEM

Description:

The Travel Information System will supplement a pilot project for a GPS-based bus locating system. This bus locating system will involve approximately 200 buses that will be assigned in the CBD of Manhattan. These will include North/South and East/West destinations. This proposed program will outfit 250 major bus stops with travel information devices. The three types of information devices will be dispersed as follows:

- * 50 interactive kiosks will be installed at major bus stop points. This may include numerous transfer points between railway routes, subway routes and other bus routes. Highly visible and tourist areas will be utilized for two reasons: 1) maximum usage of the kiosk and 2) provide vital information to the tourist who is unfamiliar with the transit system.

- * 100 video monitors will be mounted at major bus stops with transfer points to the other bus routes or subway lines. Voice announcements will also be available for the visually impaired. These monitors will be mounted in vandal-proof housings. Some storefront window locations (i.e., banks, department stores) will be made available.

- * 100 variable message signs will be installed at high volume bus stops (i.e., near schools, hospitals and shopping centers).

- * 50 vehicles will be equipped with message displays/interactive stations and appropriate voice announcements for the visually impaired.

TRAVINFO

Description:

The TravInfo project will implement a comprehensive, region-wide traveler information system, capable of supplying transportation information to a broad array of devices and users. TravInfo includes the development and operation of a multi-modal transportation information center that will integrate transportation information from a wide variety of sources and make the information available to the general public, public agencies and commercial (value-added) vendors. TravInfo will pursue an "open-access" architecture for all aspects of the system to provide for future growth and facilitate the transfer of technology.

Project Location:

San Francisco Bay Area, California

Partner(s):

California DOT (CalTrans), Bay Area Ad Hoc ITS Committee, PATH, and Metro Transportation Commission

Start Date:

April 1993

End Date:

January 2000

**Estimated Total
ITS Funds:**

\$5,072,000

**Estimated Total
Project Cost:**

\$7,347,000

ADVANCE CORRIDOR TRANSPORTATION INFORMATION CENTER

Description:

ADVANCE (Advanced Driver and Vehicle Advisory Navigation Concept) was an operational test designed to evaluate the performance of a large-scale in-vehicle navigation and dynamic route guidance system. Vehicles used in this project served as probes, providing real-time traffic information to a Traffic Information Center (TIC). Upon completion of the operational test, the ADVANCE Steering Committee concurred in the further development and modification of the ADVANCE TIC (application phase of ADVANCE) so it can serve as a prototype Corridor Transportation Information Center (C-TIC) for information dissemination efforts for the Gary-Chicago-Milwaukee (GCM) ITS Priority Corridor. The C-TIC development includes initiatives to integrate the IDOT Traffic Systems Center/Communications Center and the WisDOT MONITOR travel time and lane closure information, automate *999 and integrate incident information from several sources. A prototype of the Illinois State Toll Highway Authority I-PASS advanced traffic management system has been developed to provide travel time information for I-355 as part of the C-TIC effort and expansion of this system to the entire tollway network is currently underway. The deployment of the prototype C-TIC will be completed in June 1998. The prototype C-TIC will gradually evolve into the multi-modal traveler information system through interconnection with communication hubs for Indiana DOT, Illinois DOT, Illinois transit, and Wisconsin DOT.

Project Location:

Northeastern Illinois

Partner(s):

Indiana DOT, Illinois DOT, Wisconsin DOT, Illinois State Toll Highway Authority (ISTHA)

Start Date:

January 1997

End Date:

June 2001

Estimated Total ITS Funds:

\$9,884,839

Estimated Total Project Cost:

\$12,356,048

INGLEWOOD, CALIFORNIA ATMS PROJECT

Description:

The Inglewood, California, ATMS project builds upon existing transportation resources and encompasses the installation of a sophisticated traffic control center that controls traffic signals, conducts traffic surveillance using closed circuit TV, and provides up to the minute information on traffic to travelers through kiosks, changeable message signs, cable TV and the Internet. The project will reduce travel time in the area 20-30% before and after NBA basketball games, NHL hockey games, concerts, and other special events at the Forum, Hollywood Park Racetrack and Casino.

FY 99 funding will enable phase II of the project whose objectives include upgrading the city's existing Traffic Control Center to an advanced Traffic Management Center (TMC); installation of 30,000 plus feet of fiber optic cable for improved communication and closed circuit TV; installation of between 7 and 11 CCTV cameras; installation of a new traffic signal system in the TMC; installation of user interactive kiosks at major venues in the city. The project will integrate these components with other regional systems from agencies such as the City of Los Angeles and Caltrans District 7.

Project Location:

Inglewood, California

Partner(s):

California Department of Transportation; City of Inglewood, CA; Los Angeles County Metropolitan Transportation Authority

Start Date:

September 1997

End Date:

January 2001

Estimated Total ITS Funds:

INTEGRATED CORRIDOR MANAGEMENT

Description:

This project is being conducted by the New Jersey DOT in cooperation with the Pennsylvania DOT and the Delaware Valley Regional Planning Commission. Project components include a multi-jurisdictional clearinghouse for regional traffic information, similar to the TRANSCOM operation in Northern NJ/NY, and a study of the overall traffic and incident management needs in southern New Jersey and the Philadelphia metropolitan area.

Project Location:

Southern New Jersey and Philadelphia Metropolitan Area

Partner(s):

New Jersey DOT

Start Date:

August 1992

End Date:

December 2000

**Estimated Total
ITS Funds:**

\$6,000,000

**Estimated Total
Project Cost:**

\$7,500,000

MARKET STREET AND PENNSYLVANIA CONVENTION CENTER PASSENGER INFORMATION CENTER

Description:

This project will fund the design and construction of a comprehensive "way finding" system that provides transit system directional signage. It will utilize on-line computerized electronic information signage and graphics, with user-activated personalized service regarding both the resources of Philadelphia and specific information on public transit facilities.

Project Location:

Philadelphia, Pennsylvania

Partner(s):

Redevelopment Authority of Philadelphia

Start Date:

October 1998

End Date:

July 2000

**Estimated Total
ITS Funds:**

\$325,000

NATIONAL CAPITAL REGION CONGESTION MITIGATION

Description:

The effort consists of a variety of projects as described below:

- * \$1.25 million for the development of a suburb-to-suburb bus service between Tysons Corner and Bethesda (Administered and managed by FTA);
- * \$1.5 million toward the deployment of a travelers' information center in Prince George's County in Maryland (End Date: 6/2000; Total Funds: \$1.875M);
- * \$250,000 for a multi-jurisdictional transportation telecommunications study (End Date: 9/99; Total Funds: \$312,500);
- * \$500,000 to enhance video surveillance in Montgomery County and the Tysons area to support the Tysons to Bethesda bus service (End Date: 1/2000; Total Funds: \$625,000);
- * \$750,000 for George Mason University to assist in the Partners-in-Motion project as well as to establish an ITS implementation center at the university (Administered and managed by R&D);
- * \$1.25 million to enhance surveillance on the Virginia portion of the capital Beltway, and enhance VDOT's existing advanced freeway management system software in Northern Virginia (End Date: 4/2002; Total Funds: \$1,562,500);
- * \$100,000 for the development of an electronic fare payment services implementation plan for the National Capital Region (End Date: 4/2002; Total Funds: \$125,000); and
- * \$400,000 to provide support for the region's ITS Task Force activities (End Date: 4/2002; Total Funds: \$500,000).

Project Location:

Washington, D.C., Metropolitan Area

Partner(s):

Virginia DOT, Maryland State Highway Administration, Montgomery Co., Maryland Department of Public Works, and Prince Georges County Maryland Department of Public Works

Start Date:

October 1998

End Date:

April 2002

Estimated Total ITS Funds:

\$6,000,000

PENNSYLVANIA TURNPIKE TRAVELER INFORMATION SYSTEM

Description:

This project will provide for the development and deployment of a traveler information system for the Pennsylvania Turnpike. Components to be deployed include highway advisory radio systems, variable message signs, closed circuit television, and a central computer control system capable of controlling all new as well as existing equipment. The project will include retrofitting existing equipment as necessary to enable integration with the central computer control system.

Project Location:

Pennsylvania

Partner(s):

Pennsylvania DOT/Pennsylvania Turnpike Commission

Start Date:

September 1997

End Date:

July 2001

**Estimated Total
ITS Funds:**

\$9,000,000

WASHINGTON, D.C. - PARTNERS IN MOTION (TRAVELER INFORMATION PROJECT)

Description:

This project will implement a regional traveler information system which will become the source for a broad range of information about transportation conditions in the region. The brainchild of a coalition of public transportation agencies throughout the region, the Regional Traveler Information Project will offer the traveling public less wasted time and less travel-related stress than what they currently experience. It will also enable public transportation agencies to share information among themselves more effectively which, in turn, can help them better coordinate their operations.

Project Location:

Washington, DC Metropolitan Area

Partner(s):

Virginia DOT, Maryland SHA, District of Columbia DPW, Federal Highway Administration, Federal Transit Administration, Maryland Mass Transit Administration, Montgomery County DPW&T, Prince George's County DPW&T, Metropolitan Washington Airports Authority, Metropolitan Washington COG, Washington Metropolitan Area Transit Authority, Maryland-National Capital Park and Planning Commission, City of Alexandria DPW, City of Fairfax, Arlington County DPW, Dulles Area Transportation Association, Northern Virginia Transportation Commission, Fairfax County Office of Transportation, Potomac Rappahannock Transportation Commission, Loudon County Department of Planning, National Park Service, Tysons Transportation Association, Virginia Department of Rail & Public Transportation, Prince William County DPW&T, and Virginia Railway Express

Start Date:

September 1996

End Date:

December 2002

Estimated Total ITS Funds:

\$7,000,000

Estimated Total Project Cost:

\$12,500,000

SPRINGFIELD, MISSOURI REGION ITS PLANNING DOCUMENT

Description:

The objective of this project is the development of a comprehensive Springfield Region ITS Planning Document. Though the rural ITS effort will embrace the traffic challenges in the entire region, the emphasis of this planning document will be to address the challenges in the Springfield urban area. Being the regional focal point for services for this region, the Springfield urban area experiences a heavy influx of traffic from rapidly growing surrounding communities. This document will contain the following elements:

- The identification of current ITS initiatives in the region;
- The identification of transportation stakeholders' needs through local focus group workshops - Transit, Emergency Services (Police, Fire and Ambulance), Commercial Vehicle Operations, Major Event Facilities (University/Colleges, Fairground, Bass Pro, etc.) and Intermodal Activities (Rail - Freight - Airport);
- The development of a Planning Guide that bridges current ITS activities (legacy system) to a future regional system that follows the National ITS Architecture and standards and meets regional transportation needs; and
- The identification of benefits that will support local, state and federal funding appropriations to enhance the regional transportation system.

Project Location:

Springfield, Missouri

Partner(s):

Missouri DOT, City of Springfield

Start Date:

September 1999

End Date:

November 2000

Estimated Total ITS Funds:

\$45,735

Estimated Total Project Cost:

\$150,000

Bob Thomas	FHWA Missouri Division, HDA-MO	(573) 636-7104
Tom Ryan	Missouri DOT	(573) 526-0124

RALEIGH, WAKE CO., NORTH CAROLINA ITS INTEGRATION

Description:

The principal purpose of this project is to integrate city and state traffic operations centers to facilitate information sharing. The project also incorporates planning for the integration of light rail and an automated vehicle location component to the city transit system. Major components to be developed with FY 1999 funding include:

- Transportation Management Center to North Carolina State Highway Patrol communication and interface;
- Crabtree-to-City of Raleigh communications and system integration;
- City of Raleigh to Regional Transportation Management Center communication and integration;
- Regional Transportation Management Center (communication hub).

Project Location:

Raleigh, Wake Co., North Carolina

Partner(s):

North Carolina DOT; City of Raleigh; City of Durham; North Carolina State Highway Patrol

Start Date:

September 1999

End Date:

December 2001

Estimated Total ITS Funds:

\$1,582,939

Estimated Total Project Cost:

\$3,165,878

Ann Lorscheider	North Carolina DOT	(919) 250-4151

Integrated Systems – Priority Corridors

HOUSTON ITS PRIORITY CORRIDOR

Description:

The Houston partnership has been working together over a number of years to develop transportation management and ITS initiatives in Houston. A fully-developed, truly multimodal transportation management system serving needs such as provision of traveler information, public transportation and ridesharing, and commercial vehicle-oriented elements is envisioned. Early efforts focused on the on-going "Smart Commuter" project, and current initiatives will further enhance effective utilization of Houston's extensive network of HOV lanes, park and ride lots, transit centers, and intermodal facilities. With I-45 / I-10 as key core elements, the Priority Corridor planning process is covering all major transportation elements, with a potential highlight being creation of an ITS showcase focus within the northwest quadrant surrounding the US 290 freeway facility. Anticipated completion dates for these projects are included below where appropriate.

The Houston Priority Corridor has identified the deployment of Incident Management and Traveler Information projects as their priorities. All current projects are moving toward deployment. All future projects will be deployment of ITS technologies.

The "Smart Commuter" project, discussed separately in this publication, is being coordinated with other efforts in the Corridor. A number of additional projects have been approved or submitted for approval as part of the Houston Priority Corridor Immediate Action Program (FY93-95):

EVALUATION OF ASTRODOME AREA CCTV LEASE - The objective is to install closed circuit television on freeways and arterials that serve the Astrodome area to monitor traffic operations during special events as well as normal travel times. To accelerate the installation, the project has leased the video system from a private vendor and uses leased fiber optic cables to transmit the video (February 1995 through August 2000).

DEVELOPMENT OF CORRIDOR PROGRAM PLAN - The Plan is envisioned as a living document which will be annually reviewed and updated based upon both experience with deployed projects and evolving state-of-the-art ITS (July 1995 with annual updates).

AVI FOR TRAFFIC CONDITIONS AND INCIDENT DETECTION (PHASE 4) - This project will expand the installation of AVI to include High Occupancy Vehicle (HOV) lane access points from the Park and Ride and transit terminal facilities for shuttle bus operations and arterial streets that can serve as alternate routes to the freeway system. In addition, the freeway AVI system will be augmented with sample stations to test the application of AVI as an incident detection system.

CHANGEABLE LANE ASSIGNMENT SYSTEM ON U.S. 290 FRONTAGE ROADS - This project will design, install, and evaluate eleven dynamic lane assignment control systems that can alter the left turn lane assignments at intersections based on time-of-day traffic demands (February 1996).

PUBLIC INFORMATION AND PROGRAM ADMINISTRATION - The Program Administration office is responsible for the management, coordination, and technical

administration of the Priority Corridor Program.

MONITOR/WARNING SYSTEMS FOR FREEWAY TO FREEWAY CONNECTIONS - The objective of this project is to implement a system which identifies unsafe speed conditions, which vary by vehicle size and weight, and initiates warning devices to prevent accidents by these vehicles.

REAL-TIME INFORMATION KIOSKS - This project will deploy and test the use of real-time kiosks at activity centers to enhance the travel decision-making process of commuters and travelers. The focus is on providing improved information to transit and roadway system users to help them select the best travel mode, travel route, and time of travel.

RAILROAD GRADE CROSSING MONITORING SYSTEM - The objective of this project is to examine how information systems and traffic control systems can be used to monitor the movements of trains to adjust traffic patterns and advise emergency vehicles accordingly in the corridor to reduce delays at railroad grade crossings.

AVL FOR INCIDENT MANAGEMENT - The application of a fleet management system is essential for coordinated and effective operation of the Motorist Assistance Program (MAP). Quick response and effective dispatching of these units can reduce the time for emergency response and the time needed to restore normal traffic operations. The objective is to increase the effectiveness of incident management by implementing an AVL system which identifies MAP vehicles and their locations on a real-time basis.

IN-VEHICLE NAVIGATION/INFORMATION APPLICATIONS - The objective of this project is to provide current information on travel conditions to travelers at all stages of their trip. Decision points for alternate routes exist at several points in the corridor - two of which are within the Houston Intercontinental Airport. The scope is limited at this time to simple map information, selection of the best route, and an update of travel conditions on selected freeways and at critical decision locations.

ENVIRONMENTAL CONDITIONS MONITORING SYSTEMS - The Houston area is subject to unpredictable and severe weather conditions that can result in extensive roadway flooding during periods of intensive rainfall. The objective of this project is to investigate the potential to integrate weather and roadway flooding information into the Advanced Traveler Information System (ATIS).

CHANGEABLE LANE ASSIGNMENT SYSTEM AT SELECTED INTERSECTIONS - This project expands the deployment strategy to include traffic responsive operation between the traffic signal control system and the Changeable Lane Assignment System (CLAS) at two or three arterial street intersections in Harris County.

INTEGRATED CORRIDOR ATMS/ATIS - The concept and objective of the integrated corridor is to focus appropriate ITS technologies into coordinated management systems for future deployment as part of the Priority Corridor program. The core infrastructure developed in the Integrated Corridor will provide the ability to monitor traffic conditions, operate traffic control systems, and communicate current operational conditions to travelers.

WASHBURN TUNNEL ATMS/ATIS - This project will implement automatic incident detection and closure systems for the tunnel and develop traveler information services to advise travelers of conditions at the tunnel. An integrated, area-wide traffic management and traveler information system is proposed.

TRAFFIC MANAGEMENT AND TRAVELER INFORMATION FOR CRITICAL ROADWAY LINKS - This project will focus ITS on critical roadway system links where incidents and construction can have a severe impact on the traveling public. Each targeted critical link serves as an evacuation route for hurricane evacuation. FY 99 funding has been added to this initiative which will focus on the Fred Hartman Bridge Corridor (State Highway 46). FY 99 funding is targeted for data integration of closed circuit TV, dynamic message signs, weather monitoring systems, wind velocity and advisory speed notification systems. Integration will be achieved with TranStar (Houston's traffic and emergency management center). Four other corridors have been identified for similar initiative subject to funding availability. System integration seeks to support response procedures for roadway links targeted at routine traffic and environmental situations; reducing incidents; conditions resulting from extreme environmental conditions; natural/man made disasters.

ITS TECHNOLOGY FOR DATA COLLECTION AND TRANSPORTATION PLANNING - This project will develop a system to facilitate use of the database at Houston TranStar for planning purposes. Vehicles may also be equipped with GPS, AVL, and AVI on-board technology to collect real-time traffic data for incorporation into a GPS.

INTEGRATING TRANSIT INFORMATION SYSTEM INTO TRANSTAR - This project will integrate real-time transit information into TranStar.

PROGRAM ADMINISTRATION - Continuing support for years 3 - 5 of the Houston Priority Corridor program.

EN-ROUTE TRANSIT INFORMATION SYSTEM - This project will provide an infrastructure capable of identifying a moving transit vehicle by a roadside transponder and using the vehicle's identity to trigger an appropriate bi-directional exchange of transit rider information and vehicle data with the roadside device.

ITS ENHANCED INCIDENT MANAGEMENT - This project includes Total Station Accident Investigation Surveying Devices, Development of Incident Management Command Vehicle, Laptop Computers with CAD software for officers, and Live Video Transmission to Dispatch Centers.

AUTOMATIC TRAFFIC MANAGEMENT IN FLOOD PRONE AREAS - Existing and new water level detectors will be integrated into TranStar.

DISSEMINATION OF INFORMATION - Focus on the distribution of the following information in a variety of formats: Freeway Travel Speed Map, Travel Speed Map Text information, and Flood Control Map.

COORDINATED RAMP METERING AND INTERSECTION TRAFFIC SIGNAL CONTROL - This project would deploy and evaluate concepts and strategies for inter-relating traffic signal and ramp metering signal operations. Operational concepts would include routine operating conditions and incident management conditions.

CONDITION RESPONSIVE UPTOWN TRAVELER INFORMATION SYSTEM - This joint public/private sector project will develop improved way-finding systems to enhance the mobility and convenience of traveling for workers, shoppers, and visitors. Technologies may include static signing, CCTV surveillance, variable message signing, kiosks, cellular phone hotline, HAR, and INTERNET information.

AUTOMATED INCIDENT MANAGEMENT STRATEGIES AND SUPPORT SYSTEMS - This project will pre-plan "response scenarios" for freeway incidents which would take advantage of the integrated transportation management systems at TranStar.

INTEGRATION OF PRIORITY CORRIDOR PROJECTS INTO TRANSTAR - Houston's "Principal Integrator" will be responsible for the overall development of TranStar computer systems and will coordinate system integration and deployment to insure that all systems can function within the standards, guidelines, and established architecture.

Project Location: The Houston Metropolitan area in Harris County, Texas

Partner(s): The Texas DOT, Houston METRO, The City of Houston, and Harris County have formed a partnership, named TranStar, to guide transportation management and ITS activities.

Start Date: January 1993

End Date: On-going

Estimated Total ITS Funds: \$20,084,939

Estimated Total Project Cost: \$23,784,939

I-95 NORTHEAST CORRIDOR

Description:

The purpose of the I-95 Northeast Corridor is to test, showcase and deploy a variety of ITS services in the Corridor. The Coalition completed development of an initial "Business Plan" in May 1993. Updated in mid-1995, mid-1996, and again in early 1998, this plan, which is complemented by a Strategic Plan, is the cornerstone of the Coalition's program management. A number of feasibility, operational testing, and deployment activities are underway as listed below (project completion dates in parentheses). Current information on Coalition activities can be found on web site at <http://www.i95coalition.org>

Information Exchange Network - This project interconnected the corridor agencies into single, dedicated information exchange network for improved communication (December 1996 with on-going support).

Incident Management - This project developed uniform incident management techniques throughout the Corridor, including coordinated multi-agency response (December 1996).

Surveillance Requirements/Technology - This project developed a plan for implementation of a cost-effective, seamless, Corridor-wide surveillance system with state-of-the-art technologies. This system will serve as a platform for development, testing, and deployment of advanced technologies, and for integrating private sector initiatives with government operated systems (August 1995).

Commercial Vehicle Operations - This project developed a Corridor CVO program that coordinates on-going agency, State, Federal, Motor Carrier, and private sector CVO initiatives. An operational test of an automated traveler information system for commercial vehicles will also be developed (December 1996).

Public/Private Sector Outreach - This Project will determine the barriers and opportunities for private sector participation in Coalition activities and develop uniform policies and procedures as necessary to promote public/private partnering (on-going).

User Needs and Marketability - This project surveyed the needs of Corridor travelers and determining whether or not a commercial market exists for ATIS services in the Corridor (July 1996).

Traveler Information Services - This project ultimately seeks to provide improved traveler information services in the Corridor through a variety of dissemination methods. A feasibility study was completed in December 1995. An operational test in this area got underway in 1997. (December 2000)

Coordinated VMS/HAR Strategies - The ultimate goal of this project is to provide real-time and consistent traveler information throughout the Corridor using variable message signs (VMS) and highway advisory radio (HAR) as dissemination media. A needs definition and feasibility study was completed in July 1995, and an operational test to evaluate the technical and cost effectiveness of operating HAR stations in a coordinate fashion has been initiated (March 2000).

Technology Exchange and Training - The objectives of this project are to upgrade overall skill levels of agency staff; use staff skills and knowledge to train others; disseminate up-to-date technical information; and act as a showcase for software, hardware, and program elements (on-going).

Intermodal Outreach and Information Exchange - This project expanded Coalition membership to attract additional intermodal members and improve technical and institutional coordination between members representing the various modes (June 1996).

Corridor-Wide AVI/ETTM Strategy - This project developed a long term strategy for achieving ETTM compatibility in the Corridor (February 1997).

Regional Information and Coordination Centers - This project studied the feasibility and develop recommendations regarding regional coordination of Coalition activities. (April 1997).

Long Range Strategic Plan - This project developed the Coalition's first Strategic Plan (June 1995).

Rural Mayday/800 Call-In System - This project will test the feasibility of using cellular phones or in-vehicle devices to expedite reporting of incidents and emergencies in rural areas (April 1997).

Long Term Financing - This project will identify a stable and predictable source of funding to support Coalition activities that is capable of addressing Federal and Coalition member requirements, while allowing flexibility to address changing Coalition needs (February 1997).

NTCIP for VMS - This operational test will evaluate the National Transportation Communications for ITS Protocol (NTCIP) for use with VMS (completion date TBD).

Training - The objective of this project is to create an integrated ITS Education and Training Program. A consortium of Universities located within the Coalition states is being established that may provide graduate and undergraduate level courses, as well as skill-based training and technology transfer. (March 2000)

CVO ATIS (Fleet Forward) - This project tests the feasibility of enhancing motor carrier safety and operational efficiency by providing information to improve carrier routing and dispatching. (December 1998).

CVO Roadside Safety - This project will test an information exchange system designed to help motor carrier enforcement officials focus roadside inspections and enforcement on high-risk motor carriers (December 1999).

CVO Electronic Registration - This project will test an information system designed to help State agencies streamline credentials administration (December 1999).

CVO Electronic Clearance - This project will test mainline electronic screening and clearance of commercial vehicles by mobile enforcement units (December 1999).

CVO Safety Management - This project will develop a prototype of a comprehensive, performance-based motor carrier safety management program that will reduce highway accidents and incidents in the I-95 Corridor (December 1999).

Corridor coalition activities also involve consultant support services, use of volunteer support staff from member agencies, and a number of immediate deployment action projects.

Project Location:

Connecticut, Delaware, District of Columbia, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont and Virginia

Partner(s):

Coalition Members: The Departments of Transportation in Connecticut, Delaware, District of Columbia, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, New York City, Pennsylvania, Rhode Island, Vermont, and Virginia. Also members are the Delaware River & Bay Authority, Delaware River Port Authority, Delaware Turnpike Administration, Maine Turnpike Authority, Maryland Transportation Authority, Massachusetts Turnpike Authority, New York State Thruway, New York Metropolitan Transportation Authority, New Jersey Highway Authority, New Jersey Turnpike Authority, Pennsylvania Turnpike Commission, Port Authority of New York & New Jersey, South Jersey Transportation Authority, and Triborough Bridge & Tunnel Authority. In addition, other agencies in the transportation community in the Northeast participate as affiliate members.

Start Date: May 1993

End Date: On-going

Estimated Total ITS Funds: \$44,746,666

Estimated Total Project Cost: \$58,751,315

MIDWEST (GARY-CHICAGO-MILWAUKEE) ITS PRIORITY CORRIDOR

Description:

The States of Indiana, Illinois, and Wisconsin have formed a coalition to apply ITS in the Priority Corridor connecting Gary, Chicago, and Milwaukee (i.e. the "GCM Corridor"). Multi-state agreements have been signed and the coalition is working closely with the US DOT and local, multi-modal organizations operating transportation systems in the corridor. An Executive and Technical Committee structure has been established to involve appropriate management and technical level representatives.

Using I-80, I-90, and I-94 as a backbone, the corridor has been broadly defined to encompass the 16 contiguous urbanized counties in the three States. The corridor extends over some 130 miles and covers more than 2,500 square miles. All major freeways, tollways, arterials, transit systems, airports, ports and intermodal facilities are being identified as part of the corridor planning process.

The coalition's consultant team, in its efforts to develop a Corridor Program Plan (CPP), used focus groups, surveys, interviews, and worked closely with the Technical Committee to identify the transportation problems or "user needs" in the corridor, along with potential ITS remedies through a variety of multi-modal ITS "User Services". The initial CPP was approved by the Executive Committee in June, 1995, and was updated in July, 1997. It presents near-term (1-2 year) and longer-term (3-20 year) projects for the implementation, management and evaluation of a multi-state, multi-modal ITS corridor program. The CPP identifies 10 program areas:

- * Multi-Modal Traveler Information System
- * Integrated Transit System
- * Incident Management Programs
- * GCM Technical and Planning Support
- * Traffic Management Systems
- * Commercial Vehicle Operations
- * Traffic Signal Integration
- * Vehicle Transponder Systems
- * Advanced Incident Reporting and Mayday Security
- * Private/Public Partnerships.

In accordance with the CPP, the GCM Priority Corridor is currently implementing Year-1 projects. Efforts are underway to update the CPP to identify future Year-3 and Year-4 projects.

Some projects currently underway include:

Development of Regional Strategic Plans, Corridor Strategic Plan and Corridor Architecture

On-Board Vehicle Warning System for Railroad Grade Crossings pilot test

Expansion and Enhancements of the Indiana Hoosier Helpers Program - this effort includes the hiring and training of new staff members, expansion of coverage to 24 hours/day, and purchasing of additional patrol vehicles. An expert system is being

developed to extend the wireless communication system installed under the Borman Expressway project to support the transmission of closed-circuit video, data, and location information directly from incident scenes. This expert system will be capable of identification and notification of the proper emergency response agencies.

Equipment Upgrade of the Illinois Emergency Traffic Patrol - the current emergency traffic patrol fleet is being equipped with quick-tow devices which enable operators to safely and expeditiously relocate disabled vehicles to a safe location off of the highway system without having to exit the patrol vehicle. This will significantly decrease both the exposure of the operator to dangerous roadway conditions and the time required to clear minor accidents.

Wisconsin Integrated Corridor Operations Study and Operational Test

The GCM Priority Corridor is currently developing a Public Information Center. This center will serve as a centralized source of information for all GCM Corridor initiatives. The center will include a 800-telephone voice mail information line to serve public inquiries.

Project Location:

Lake, Porter, and Laporte counties in Indiana; McHenry, Lake, Kane, Cook, Dupage, and Will counties in Illinois; and Washington, Ozaukee, Waukesha, Milwaukee, Walworth, Racine, and Kenosha in Wisconsin.

Partner(s):

Chicago Area Transportation Study, Illinois DOT, Indiana DOT, Illinois State Toll Highway Authority, Milwaukee County Public Works, Northern Indiana Commuter Transportation District, Northwest Indiana Regional Planning Committee, Regional Transportation Authority, Southeast Wisconsin Regional Planning Committee, Wisconsin DOT, Argonne National Laboratory, Chicago Transit Authority, City of Chicago DOT, City of Milwaukee, Marquette University, Metra, and Milwaukee County Transit and Pace

Start Date:

January 1993

End Date:

On-going

Estimated Total ITS Funds:

\$18,690,000

Estimated Total Project Cost:

\$23,362,499

SOUTHERN CALIFORNIA CORRIDOR

Description:

Transportation agencies within the Southern California Priority Corridor have organized into four coalitions generally bounded by the jurisdictions of the California Department of Transportation (CalTrans) Districts 7, 8, 11, and 12. These coalitions are called Regional ITS Coordinating Teams. Each team provides representatives to the Corridor Steering Committee. The teams work at the management level to form plans, strategies and project lists to present to their respective constituents and parent organizations; set priorities and facilitate and possibly endorse publicly funded ITS projects within the region. Membership generally represents CalTrans district, city, county, Metropolitan Planning Organization, transit agency, Highway Patrol, and Air Quality Management District.

The Corridor Steering Committee is the forum to address corridor-wide user services, functional requirements, architecture and standards to ensure compatibility as deployments progress and merge at regional boundaries. The Committee provides an interactive point of contact for other California and ITS planning efforts.

Three major categories of activity are in progress in the Southern California Corridor. Operational tests, strategic deployment and planning, and a major demonstration of an intermodal transportation management and information system known as "Showcase".

Projects encompassed by the Southern California Corridor include:

- * Integrated Ramp Metering/Adaptive Signal Control
- * SCOOT Adaptive Traffic Control System
- * Mobile Communications System
- * Smart Call Box
- * Spread Spectrum Radio Traffic Interconnect
- * SMART Corridor
- * Los Angeles Smart Traveler
- * Ontario Smart Vehicle (ATHENA) - Phase I Demonstration will develop a preliminary design for a demonstration of door-to-door shared rides using 100 vans equipped with "Smart Technology" and will evaluate technologies and interfaces, leading to a procurement to implement the actual demonstration.

Strategic Planning - A strategic deployment planning study in the broadly defined S. California Priority Corridor will evaluate and plan what technologies will be programmed for deployment, and define an architecture that is consistent with the national architecture. The planning study began in 1995 and was completed in mid-1997.

"Showcase" Intermodal Transportation Management and Information System (ITMIS) and Early Start Projects - The ITMIS project will deploy an intermodal transportation management and information system to optimize and coordinate freeway and street operations with public and private transportation systems within the corridor. Cooperative effort will be established in areas such as system management, transportation demand

management, transportation provision and fleet management.

Traveltip, the first ITMIS project being developed and deployed under the Showcase initiative, was in fiscal year 1995 and will provide for an interregional multimodal advanced traveler information system in the Orange County region. The project will deploy technology used to improve traffic and transit operations, and provide information to transportation managers, travelers, and third party users to enhance decisions on transportation management, route selection, and mode choice. Traveltip is basically a smaller version of what is envisioned for the entire corridor, with scheduled completion in May 2000.

The Showcase concept identified early-start projects in addition to the main priority of developing a corridor-wide ITMIS. Planning for Phase I was completed in January 1997, and Interface Development for Phase II was completed in August 1999. Four San Diego-area projects were also initiated in FY 95 with scheduled completions: Transit Management Information System (March 2000); Computer-Aided Dispatch (December 1999); Jack Murphy Stadium Traveler and Traffic Info System (December 2000); and San Diego Intermodal TMC (December 2001).

Project Location:

Southern California: This area lies within major urbanized and adjacent non-urbanized areas of Ventura, Los Angeles, San Bernadino, Riverside, and San Diego Counties and all of Orange County.

Partner(s):

Steering Committee: Caltrans Headquarters New Technology, CalTrans District 7, Caltrans District 8, CalTrans District 11, CalTrans District 12, Southern California Association of Governments, San Diego Association of Governments, San Bernardino Association of Governments, Orange County Transportation Authority, City of San Diego, California Highway Patrol, and the South Coast Air Quality Management District

Start Date: January 1993

End Date: On-going

Estimated Total ITS Funds: \$28,314,000

Estimated Total Project Cost: \$35,473,000

**Integrated Systems –
Metropolitan Model Deployment Initiatives**

NEW YORK-NEW JERSEY-CONNECTICUT (TRANSCOM) ITS INFRASTRUCTURE MODEL DEPLOYMENT

Description:

The New York City metropolitan area Model Deployment will showcase ITS infrastructure to millions of local commuters, commercial vehicle operators, and other travelers. TRANSCOM, the lead organization, is a consortium of fourteen transportation and public safety agencies from throughout the region. The widely dispersed public agencies will implement a Regional Transportation Management System connecting member agencies through a "virtual" Transportation Management Center. A contractor will operate a Multimodal Traveler Information System that will include personalized information to the public for a fee, eventually becoming self-supporting.

Project Location:

New York City metropolitan area, NY/NJ/CT

Partner(s):

TRANSCOM, New York State Department of Transportation, and the Northeast Consultants

Start Date:

October 1996

End Date:

June 2000

Estimated Total ITS Funds:

\$10,610,000

Estimated Total Project Cost:

\$15,067,648

Contacts:

PHOENIX, ARIZONA AZTECH MODEL DEPLOYMENT INITIATIVE

Description:

The Phoenix AZTech Model Deployment Initiative will integrate the Trailmaster Freeway Management System, seven local area city Traffic Signal Operations (TOCs) along identified priority corridors, City of Phoenix Public Transit Department management and dispatching system, Maricopa County Emergency Management System, Sky Harbor International Airport management/information system and electronic fare systems associated with the City of Phoenix Public Transit Department and Sky Harbor International airport for a truly regional, multimodal transportation management system. This will be accomplished by adding hardware to and modifying software within local TOCs to accommodate interoperability and extending the communications from Trailmaster to the local TOCs. In addition, the corridors will be instrumented with additional sensors and incident detection (CCTVs) to support the measurement of traffic volume, flow rate and the rapid detection and clearance of incidents.

As part of the Model Deployment Initiative, the City of Phoenix Public Transit will instrument their transit vehicles with Automatic Vehicle Location (AVL) so that these vehicles can be used as traffic probes and to monitor schedule adherence.

The Model Deployment Initiative will develop a traveler information system to collect, fuse, package and deliver multimodal traveler information to the public via a variety of mechanisms. Jurisdictional ITS linkages utilizing the Arizona DOT (ADOT) communications network will provide sharing of corridor status, travel times, hazard information and corridor closure information among state, county and city systems. The AZTech Integrated Regional Traveler Information Center will be established at the ADOT TOC and will be developed by TRW.

ETAK, with its partner Metro Networks, Inc., will manage AZTech, and will promote business development of fee paying clients. Distribution channels include dial-up telephone (free), public kiosk (free), INTERNET (free, except for access fee paid by users), for-fee cellular, for-fee paging, and for-fee interactive cable TV. The public will receive the benefit of for-fee distribution of traveler information via Metro Networks traffic center to broadcast TV, cable TV, and radio stations. For those broadcast TV and radio stations desiring standard traveler information only available from public sources, it will be made available through existing ADOT interface to broadcast stations. Traveler information will include corridor, public transit, and airport information, as well as electronic Yellow Pages supplied by commercial clients.

Evaluation, training, public relations, education and outreach will also be carried out under Model Deployment Initiative efforts.

The Phoenix AZTech Model Deployment Initiative will be operational by July 1998. A year of data collection will follow to evaluate the benefits of an integrated metropolitan area ITS infrastructure. The final evaluation report will be available in March 2000.

Project Location:

Phoenix, Arizona

Partner(s):

Arizona Department of Transportation, Maricopa County, Cities of Phoenix, Tucson, Chandler, Glendale, Mesa, Scottsdale and Tempe; Regional Public Transit Authority, Phoenix Transit Department, Maricopa Association of Governments, Pima Association of Governments, Arizona State University, Sky Harbor International Airport, TRW Transportation Systems, Scientific Atlanta, Inc., and the Etak Team (which may include the following companies: Metro Networks, CUE Paging Corp., Differential Corrections, Inc., SEIKO Communications, Inc., SkyTel, Hewlett Packard, Fastline, Clarion, Delco Electronics, Volvo, IT Network, and ATT)

Start Date:

October 1996

End Date:

March 2000

**Estimated Total
ITS Funds:**

\$7,520,000

**Estimated Total
Project Cost:**

\$18,450,000

SAN ANTONIO, TEXAS TRANSGUIDE METROPOLITAN MODEL DEPLOYMENT

Description:

The San Antonio, Texas metropolitan area Model Deployment builds on the successful TransGuide Operations Center, where the Texas Department of Transportation, the city traffic operations, transit dispatch, police traffic dispatch and police/fire/emergency dispatch are all co-located. The fully integrated TransGuide Model Deployment will cover nearly 200 miles of freeways and the majority of streets within the San Antonio metropolitan area. 78,000 vehicles will be equipped with Intelligent Vehicle Tags. These tags will allow the equipped vehicles to serve as roving "traffic probes," reporting on current travel times throughout the metropolitan area. Real-time, multi-modal traveler information will be provided to the traveling public through TransGuide TV 54, an in-vehicle route guidance system, kiosks, the INTERNET, and highway advisory radio. The TransGuide communications system will support video teleconferencing between local trauma centers and EMS units, providing physicians with the opportunity to see the patient and directly monitor vital statistics at the accident scene and en-route to the hospital.

The San Antonio Model Deployment was fully operational by September 1998. A year of data collection will follow to evaluate the benefits of a fully integrated metropolitan area ITS infrastructure. The final evaluation report will be available by March 2000.

Project Location:

San Antonio, Texas

Partner(s):

Texas Department of Transportation, VIA Metropolitan Transit Authority, City of San Antonio Department of Public Works, City of San Antonio Police Department, City of San Antonio Fire Department, Alpine Electronics Research of America, Amtech Systems Corporation, Southwest Research Institute, Navigation Technologies, Scientific Atlanta, Fatura, Zexel USA, and H.B. Zachry

Start Date:

October 1996

End Date:

March 2000

Estimated Total ITS Funds:

\$7,144,000

Estimated Total Project Cost:

\$13,954,500

SEATTLE, WASHINGTON SMART TREK MODEL DEPLOYMENT

Description:

The Seattle, Washington Smart Trek Model Deployment Initiative will showcase the implementation of the ITS infrastructure to commuters both around the world and especially to the Seattle area residents. The traveling public and local officials will see and experience the benefits of a 21st century transportation system in a real-life setting. The Seattle Smart Trek Model Deployment project will provide intermodal transportation management and integrated, real-time highway and transit information services for the entire Seattle metropolitan area.

The Seattle Model Deployment Initiative was operational in December 1997. A year of data collection will follow to evaluate the benefits of an integrated metropolitan area ITS infrastructure. The final evaluation report will be available March 2000.

Project Location:

Seattle, Washington

Partner(s):

Smart Trek is a coalition of public and private partners joining together to develop this model deployment initiative. The partners include: Bartizan American Communications, Battelle Pacific Northwest Laboratories, Boeing Company, City of Bellevue Transportation Department, David Evans and Associates, Inc., Etak Inc., Fastline, IBI Group, ICON, King County Department of Transportation, Metro Traffic Control, Inc., Microsoft, Inc., Pacific Rim Resources, Inc., PB/Farradyne Inc., Seiko Communications Systems, Inc., Puget Sound Regional Council, TRAC-UW, Transportation Division Seattle Engineering Department, University of Washington, Washington State Department of Information Services, Washington State Department of Transportation, XYPOINT Corporation, and Greater Redmond Transportation Management Association

Start Date:

October 1996

End Date:

March 2000

**Estimated Total
ITS Funds:**

\$13,688,000

**Estimated Total
Project Cost:**

\$54,826,000

Integrated Systems – Statewide/Regional Integration Programs

MINNESOTA GUIDESTAR PROGRAM

Description:

Minnesota Guidestar provides overall direction to the Minnesota Department of Transportation's ITS program by providing a focus for strategic planning, project identification, project initiation, project management, and evaluation. Minnesota Guidestar also provides coordination with other State and local agencies in Minnesota, such as the University of Minnesota, which have an interest and role in ITS.

In addition to the national ITS operational field tests described elsewhere (Evaluating Environmental Impacts Using LIDAR, Advanced Rural Transportation Information and Coordination, Genesis, Travlink, and Trilogy), the Minnesota Guidestar program manages a number of locally important operational field tests and a large ITS research program jointly with the University of Minnesota, Center for Transportation Studies, Intelligent Transportation Systems Institute. Some of these projects are described below, and others are under development.

INTEGRATED CORRIDOR TRAFFIC MANAGEMENT (ICTM) - This project is evaluating the ability of multiple agencies to manage freeways and arterials in a heavily traveled corridor as a "seamless" system using real-time adaptive control systems covering street signal systems and the freeway ramp metering system. Installation of the first phase equipment is underway, with subsequent phases of work initiated in early 1996. Full operation of the test started in 1997.

POLARIS - The Polaris project will produce a statewide ITS architecture defining an integrated system of ITS technologies for providing user services in Minnesota. The project began in July, 1995, and was completed in December, 1996.

DURING INCIDENTS VEHICLES EXIT TO REDUCE TRAVEL TIME (DIVERT) - This project will provide traffic guidance and control during freeway incidents, by managing traffic through coordinated signal timing plans along designated streets in downtown St. Paul. The diverted traffic added to the streets is accommodated in a planned fashion, as opposed to traffic randomly entering downtown St. Paul. The test phase of the project began in January, 1995.

PORTABLE TRAFFIC MANAGEMENT SYSTEMS (PTMS) - This project used a portable electronic traffic management system including changeable message signs, CCTV, portable signal systems, cellular and spread-spectrum radio communications, and a lap-top commuter monitor and control system to manage traffic associated with several sporting events and the Minnesota State Fair. The PTMS has resulted in a package of devices which can be deployed in fairly short notice to manage traffic where no existing surveillance and control systems. The evaluation report was completed in July, 1995.

ADAPTIVE URBAN SIGNAL CONTROL AND INTEGRATION (AUSCI) - The objective of this project is to implement an adaptive signal control algorithm for the existing traffic control system in Minneapolis, and also integrate with the existing ramp metering systems along I-394 and I-94. This project is in the design phase.

SMARTDARTS - The SmartDARTS Project will measure the benefits of a combination of

advanced technologies within a paratransit environment. Objectives of the project include: improved responsiveness; increased capacity; and increased cost effectiveness. The test portion of the project began in July, 1995.

IN-VEHICLE SIGNING SYSTEM FOR SCHOOL BUSES AT RAIL-HIGHWAY

CROSSINGS - This project will bring together key parties to develop the infrastructure, system electronics and in-vehicle units for the first in-vehicle signing system. This will serve to increase safety by: removing uncertainty about driving conditions; assessing the driver in the decision making process; and easing the overall driving task in general. The project was completed in May, 1997.

MAYDAY PLUS - This project will demonstrate significant, measured reductions in the times taken to reach victims of rural motor vehicle accidents through enriching the information made available to emergency service providers, thereby reducing

ST. PAUL ADVANCED PARKING INFORMATION SYSTEM - The Advanced Parking Information System is designed to provide motorists with real-time information regarding the status of parking facilities plus directions for the best routes to open parking facilities using automated variable message signs and static signs. Testing of the system began in January, 1996.

DULUTH TRANSPORTATION OPERATIONS CENTER - The purpose of the Duluth Transportation Operations Center is to cooperatively enhance traffic management and traveler information capabilities in order to increase the safety and efficiency of the transportation system in the Duluth area. The geography of the Duluth area presents unique challenges to the motorist, rapidly changing weather conditions, rugged terrain, limited alternate routes and peak tourist volumes often times make travel difficult. There is a need to furnish motorists with timely information as to road/weather conditions, events, alternate routes, provide swift incident response and have a central location for information on all modes of transportation. The goals of the Duluth Transportation Operations Center are to develop an expandable traffic management system, deploy a real-time traveler/weather information system, establish a framework for interagency cooperation for incident response and operation/maintenance of traveler information systems and to integrate transit operations into a Traffic Management System.

ST. CLOUD TRANSPORTATION OPERATIONS CENTER - This project will improve the signal operations and maintenance in the St. Cloud metro area by reviewing the existing practices of the city, county, and state then implementing actions to address these issues. Examples of issues to be addressed are: signal coordination, signal repair, monitoring of signals, jurisdictional boundaries, etc. It will also provide travel information to the public via real-time messages on site and other means that are to be established. Seasonal congested areas, construction information, and winter weather closures on I-94 are some areas that are being reviewed for information needs.

SOUTHWEST AND WEST-CENTRAL MINNESOTA TRANSIT LINK PROJECT - The need to access regional centers is a crucial link to maintain the region's population and economic vitality. The three public transit systems of Prairie Five Rides, Rainbow Rider and WESCAP Heartland Express provide public service to a combined total of fourteen rural counties. These three transit programs have been working together to expand access to common regional centers and coordinate services for the best service level at the lowest

operational costs. This endeavor requires a high-level of fast, reliable and simple communication between each system and common local data management practices and parallel data operating systems.

ROCHESTER TRANSPORTATION OPERATIONS CENTER - The focus of this project is to improve safety and relieve congestion along the Highway 14/52 corridor in Rochester. One component of this project includes a six-month study which will be used to develop a comprehensive and detailed concept plan for ITS in the Highway 14/52 corridor.

The concept plan will include an early deployment plan which will be designed and constructed in the next two and a half years. Some of the features of the early deployment plan could be variable message signs, a closed circuit television system, traffic management systems, and road weather and traveler information kiosks. This project will not only address safety and congestion concerns well into the future, it will also serve as part of the traffic control during the Highway 14/52 construction. FY 99 ITS Integration earmarked funding is applied to this project.

MANKATO TRANSPORTATION OPERATIONS CENTER - The project combines real-time traveler information and data collection with traffic management and operational features. The three primary goals of this project are to provide positive traffic control on Interstate 90 from Albert Lea to the South Dakota State Line during adverse weather conditions, manage the traffic signal systems in the Mankato area as well as provide traveler information for special events/incidents, and provide real-time traveler and operational information for the public transit systems. The I-90 road closure system is designed to improve safety and efficiency of I-90 between I-35 and South Dakota. By closing the roadway at the optimal time, fewer accidents and vehicle stalls will occur and snow plowing can occur with fewer delays to tend to stalls, abandoned vehicles and stranded travelers. All of these facts allow the road to be reopened to travel more quickly and restored to a better pavement surface condition because there has been less compaction of snow. Travelers benefit because they have been able to wait at locations with adequate facilities. The system has been coordinated with the South Dakota gate closure system to assure a relatively uniform presentation to travelers in both states. FY 99 ITS Integration earmarked funding is applied to this project.

MOORHEAD AREA INTEGRATED TRAIN DETECTION AND TRAFFIC CONTROL SYSTEM - The purpose of the Moorhead Area Integrated Train Detection and Traffic Control System Project is to develop an integrated system for detection of trains so that special timing plans can be selected when trains are approaching and when trains are present. It will also provide travelers and dispatchers with information on train movements. This system is needed in Moorhead because an average of 70 trains per day pass through the City of Moorhead on tracks that cross many local and arterial streets at-grade. The average passage time is four minutes at each intersection for a total of about 4 hours and 40 minutes per day. The current traffic signal system has only some intersections with localized railroad preemption. This project will address the following problem conditions:

- Safety concerns at high volume at-grade railroad crossings,
- Increased emergency vehicle response time when trains are present,
- Interruption of transit operations when trains are present, and
- Extensive vehicular delays when trains are present.

FY 99 ITS Integration earmarked funding is applied to this project.

IVI SNOWPLOW DEMONSTRATION PROJECTS - Minnesota's heavy snow, blowing snow, and ice impact travel. These impacts include crashes, stalls and stranded travelers, abandoned vehicles, travel delays and increased time for emergency vehicles to respond to incidents or to transport sick or injured persons. The societal costs, including deaths, injuries, property damage, lost productivity, etc., of these impacts are significant.

Minnesota undertook an Intelligent Vehicle Initiative - Specialty Vehicle (Snow Plow) Case Study to determine potential benefits of using technology packages which assist snow plow operators to "see" the road boundaries and/or lane lines and obstacles (such as other vehicles, roadside appurtenances and large snow drifts) in extreme low visibility conditions. The Case Study describes how these packages will increase snowplow operator productivity and confidence during the worst conditions and therefore reduce crashes, incidents, delays, etc. This is done by the use of sensors that detect the road surface and stalled vehicles, slow-moving vehicles, and persons walking on the road. The Case Study assesses the potential safety and operational benefits of various levels of penetration of these market packages. It defines two demonstration or operational tests of some set of technology packages in maintenance vehicles, a commercial vehicle fleet or both. FY 99 ITS Integration earmarked funding is applied to this project.

STATEWIDE ADVANCED TRAVELER INFORMATION SYSTEMS SUPPORT - The purpose of the Statewide Advanced Traveler Information Systems (ATIS) Support Project is to develop an overall strategy and design for the creation of a statewide advanced traveler information system. This will incorporate the individual ATIS efforts throughout the state into a cohesive system where they will cooperatively enhance the traveler information capabilities throughout the state. There is a need to furnish motorists with timely information as to road/weather conditions, events, alternate routes, provide swift incident response and have a central location for information on all modes of transportation.

The goals of the Statewide ATIS are the following:

- To make travel safer through the State of Minnesota
- To make travel in Minnesota more efficient
- To increase the user satisfaction for those persons traveling in Minnesota

The Statewide ATIS will include such components as:

- Road Surface Conditions
- Weather and Visibility Conditions
- Construction and Maintenance Delays
- Incident Delays
- Tourism Information
- Weight Restrictions
- Road Closures/Openings

FY 99 ITS Integration earmarked funding is applied to this project.

COMMERCIAL VEHICLE INFORMATION SYSTEMS AND NETWORKS (CVISN) - The Minnesota CVISN pilot project was one of seven CVISN pilot project states to be selected as prototype states. The CVISN Model Deployment Program will focus on increased safety and efficiency through electronic integration of CVO information systems. The CVISN project will enhance Minnesota's information systems by creating open electronic data interchange standards and interfaces for all CVISN systems. It will provide safety information distribution at the roadside, electronic application for credentials, electronic clearinghouses for the payment of the registration tax and fuel tax, along with the electronic clearance of trucks at fixed and mobile enforcement sites.

UNIVERSITY OF MINNESOTA ITS RESEARCH PROJECTS - Various research projects will be conducted at the University of Minnesota. Identification and selection of the research projects has resulted in the need to address the following areas:

- Traveler Services
- Traffic Management
- Maintenance Operations
- Vehicle Technologies
- Safety and Human Factors
- Modal and Rural Issues
- Infrastructure Systems
- Societal and Environmental Issues.

FY 99 ITS Integration earmarked funding is applied to this project.

HIGHWAY/RAILROAD INTERSECTION OPERATIONAL TEST

This project will provide two separate tests of technology to build upon the successfully In-Vehicle Signing operational test. The first test will be to develop and operationally test, including a human factors evaluation, a prototype low cost active warning system designed to be used at low volume Highway/Railroad Intersections (HRIs). This test will provide active warning at a crossing currently only containing passive warning devices. The concept includes red flashing LEDs on the standard cross buck sign, and amber flashing LEDs on the advanced warning system. The system would be powered by a solar cell with 12-volt battery backup. Train detection would be by means of a Head-of-Train (HOT) signal detector. The system would have a flicker or other pattern when it is not performing properly, but otherwise would operate the same as an existing active warning system with only flashing lights.

The second test will include an updated in-vehicle sign for use in additional school buses and other vehicles required to stop at HRIs. Train detection would either be built into the in-vehicle device or detected at the crossing via broadcast to approaching vehicles. The goal of this HRI project is safety, primarily focused at low volume HRI where traditional warning systems cannot be cost effectively deployed. Both of the HRI efforts will demonstrate and test technologies, information flows, and data flows that are not fully developed in the National ITS architecture and standards at this time. These projects will continue to lead the way in the field of roadside-to-vehicle communications for HRI. FY 99 ITS Integration earmarked funding is applied to this project.

RURAL ITS CORRIDOR ITS TECHNOLOGY DEMONSTRATION CORRIDOR

There is a need to test ITS technologies that will improve safety and efficiency of travel on two-lane highways outside of urban areas. About 70% of all fatal crashes occur on two-lane roads passing through countrysides or small towns under 5,000 population. The traditional solution to safety and capacity problems on these roads is to add more lanes, close access openings, build frontage roads, etc. These solutions are becoming less and less viable due to limited construction resources and the need to preserve the natural environment.

This project will seek to identify and test ITS market packages individually or as a group that can be used to address the safety and capacity on two-lane rural roads. To date informal conversations have occurring between Mn/DOT and several potential public and private partners that are interested in pursuing this goal with Mn/DOT. No specific partner, technology, ITS market package or architecture has been selected for this project as of this time. FY 99 ITS Integration earmarked funding is applied to this project.

Project Location: Statewide throughout Minnesota

Partner(s): Minnesota DOT is lead and other partners include: Federal, State and local agencies and private companies interested in the evaluation and deployment of ITS user services and technologies. Principal State agencies include University of Minnesota, Minnesota State University; Department of Public Safety and the Minnesota State Highway Patrol

Start Date: January 1991

End Date: On-going

Estimated Total ITS Funds: \$33,699,000

Estimated Total Project Cost: \$82,036,000

SOUTHERN STATE PARKWAY

Description:

This program is closely aligned with the INFORM project, which is now operating within Long Island. It is expected that surveillance, control and traveler information techniques will expand on those currently used in INFORM to take advantage of state-of-the-art hardware/software systems. The State has initiated the program with an investigation into how this work should be coordinated with INFORM, along with opportunities to tie the management system into facilities which approach the I-95 corridor at the western end of Long Island.

Two specific projects are also being conducted as part of this program. The Traffic Flow and Visualization Control (TFVC) project investigated a video-based vehicle detection, visualization and management system which employs leading edge technology developed in the military. Through the user of advanced video data processing, neural network analysis and intelligent command and control technologies, the traffic adaptive system will identify and alert the system operator to real-time traffic conditions such as recurring congestion, non-recurring incidents, and other traffic problems normally associated with freeway operations. The system has been successfully demonstrated in the laboratory and was field tested at thirty locations along the Long Island Expressway as part of the INFORM corridor. This program was being handled as an element in the Southern State Parkway program through an interagency agreement with the U.S. Air Force. One of the national labs, Rome Laboratory, is being utilized as the project manager.

A second project developed a traffic congestion forecasting model for the INFORM System. This project supported the development of a computerized traffic forecasting model by the Brookhaven National Laboratory. The model is called ATOP for Advanced Traffic Occupancy Prediction. The model will eventually take on-line traffic data from INFORM system roadway sensors on Long Island and make projections as to future traffic patterns using the following routines:

- * Statistical forecasting of traffic flow and occupancy using long and short term information
- * Estimation of the relationships between traffic flow and occupancy
- * Statistical detection and classification of anomalies and their impact on highway capacity
- * Adaptive correction and updating to control prediction errors

The final report, titled "Traffic Congestion Forecasting Model for the INFORM System," is available from the National Technical Information Service and ITS America.

The final report for the Traffic Flow and Visualization Control Project has been submitted through FHWA channels.

TRANSCOM CONGESTION MANAGEMENT PROGRAM

Description:

TRANSCOM (Transportation Operations Coordinating Committee) is a consortium of 15 transportation and public safety agencies in the New York, New Jersey and Connecticut area whose goal is to improve inter-agency response to traffic incidents. A number of project initiatives have been undertaken to support this goal, and to advance the use of ITS-related technologies in the metropolitan area, and others are under development. These include:

- Regionwide initiatives for coordinated deployment and operation of variable message signs, highway advisory radio, and enhanced traffic monitoring including closed-circuit television.
- Development of an "ITS Regional Implementation Strategy," a program for coordinated implementation of ITS throughout this complex, multi-jurisdictional metropolitan area.
- An enhanced traffic advisory/diversion system at the intersection of the New Jersey Turnpike and Garden State Parkway; which will focus on alternate routing for New Jersey Transit buses.
- Expansion of traffic monitoring along the I-287 Tappan Zee Bridge corridor.

Operational tests being conducted under this program (TRANSMIT, Alternate Bus Routing) are described elsewhere in this document.

Project Location:

New York, New Jersey

Partner(s):

New York State DOT, New Jersey DOT, TRANSCOM and other member agencies

Start Date:

January 1990

End Date:

On-going

Estimated Total ITS Funds:

\$17,325,000

UTAH ITS INTEGRATION

Description:

This project will continue the planning, design and deployment of ITS infrastructure in conformance with established regional priorities identified in ITS Early Deployment Planning as amended by the Salt Lake Olympic Committee. The following activities comprise the initiatives which will be pursued:

- Expansion of the Utah DOT Incident Management Program;
- Improvement of advanced traveler information systems;
- Expansion of the Regional Advanced Traffic Management System;
- Automatic Vehicle Locating for Olympic Athlete and Olympic Family Vehicles;
- Expand the functionality of University of Utah Research Traffic Operations Center to support Olympic operations, to support system testing, evaluation and research activities.

Project Location:

Salt Lake City Area

Partner(s):

Federal Railroad Administration, Utah DOT, Salt Lake Olympic Committee, Wasatch Front Regional Council, Salt Lake County Department of Public Works, Salt Lake City Transportation Division, Utah Transit Authority, Mountainlands Association of Governments, Utah Department of Public Safety Highway Patrol, Salt Lake City Airport

Start Date:

September 1999

End Date:

December 2002

Estimated Total ITS Funds:

\$ 2,849,290

Estimated Total Project Cost:

\$ 11,349,290

STATE OF NEW MEXICO STATEWIDE ITS ARCHITECTURE

Description:

The purpose of this project is to develop a Statewide ITS Architecture which will integrate metropolitan, multimodal and rural ITS components. Statewide and metropolitan planning activities will consider an array of actions and investments that will improve the networks' overall capabilities; consider regional operations and management strategies; include ITS services and development of a regional ITS architecture; engage a wide array of stakeholders to ensure a broad range of integration opportunities; and incorporate ITS into the Statewide transportation planning process.

The development of a Statewide Architecture is intended to achieve the following goals and objectives:

1. Identification of a broad range of stakeholders by addressing individual and common needs to achieve integration and information sharing;
2. Identification of transportation needs addressed by ITS through operational and management strategies to meet the goals and needs while minimizing risks and costs of integration;
3. Description of existing and planned ITS enhancements to aid in adding value to legacy systems and support interoperability with planned systems, thereby improving the operations and management of the transportation system;
4. Definition of operating requirements to develop operational agreements across state, physical and institutional boundaries;
5. Identification of planned capital projects to determine which ITS project can be implemented into the construction;
6. Development of a phasing schedule to enable deployment of integrated components over time;
7. Development of regional technology agreements and partnership arrangements among state and local agencies and entities and encouraging public/private partnerships;
8. Identification of planned improvements for inclusion of ITS projects into the Statewide Transportation Improvement Program (STIP), Transportation Improvement Programs (TIPS) and/or Commercial Vehicle Safety Plan.

Project Location:

State of New Mexico

Partner(s): New Mexico State Highway and Transportation Dept.; City of Albuquerque Transit; Public Works and Environmental Health Dept.; Bernalillo County Dept. of Public Works; City of Rio Rancho Public Works Dept.; Sandoval County; Middle Rio Grande Council of Governments; University of New Mexico

WASHINGTON, DC METROPOLITAN REGION ITS INTEGRATION

Description:

The purpose of the ten project activities described here is to improve transportation services and enhance the quality of life for residents and visitors to the National Capitol Region. The multi-year program is being guided by the Metropolitan Washington Council of Governments' ITS Task Force, and adheres to regional strategic planning documents. The subprojects are grouped by responsible agencies having oversight responsibilities.

MARYLAND STATE HIGHWAY ADMINISTRATION

Subproject: ITS Training (\$250,000)

Funding will be provided to universities and technology transfer centers serving the region to provide high priority training for those responsible for planning, developing, operating and maintaining ITS. The training will follow five tracks:

- Information Technology
- ITS Systems Technology
- ITS in Transportation
- Management
- Public Policy

Subproject: Automate the Interface Between Montgomery County, Maryland ATMS and Partners in Motion/Smart Traveler (\$250,000).

In conjunction with modifications that are being made to the regional traveler information project called Partners in Motion, four public agencies will integrate their software with that project's software suite. Virginia Railway Express, Virginia DOT, and Maryland State Highway Administration will integrate software systems with Partners in Motion. Montgomery County will integrate its Advanced Transportation Management System database with Partners in Motion.

Subproject: Washington, D.C. Regional ITS Architecture (\$200,000)

This activity will develop a high-level regional ITS architecture for the Washington, D.C. Metropolitan area.

Subproject: Wireless Location Technology Demonstration (\$500,000)

This demonstration of the use of cellular location technology for traffic monitoring will take place on the Capital Beltway between the Springfield interchange in Virginia and Forrestville, Maryland. Initially traffic flow will be monitored only on the Beltway. Subject to results, monitoring activities on arterials may be undertaken.

DISTRICT OF COLUMBIA DEPARTMENT OF PUBLIC WORKS

Subproject: District of Columbia Incident Management Plan (\$400,000)

The District of Columbia is in the process of implementing an integrated transportation management plan. This initiative, integrated with regional systems in adjacent jurisdictions, will enable the District to activate incident and special event diversion/traffic management plans through the use of portable signs.

Subproject: Signal Preemption Operational Test (\$350,000)

The District of Columbia Department of Public Works recently completed a test of signal preemption for emergency vehicles near a major medical center. This activity will extend and expand this implementation to transit and other vehicles.

VIRGINIA DEPARTMENT OF TRANSPORTATION**Subproject: Signal Priority and Preemption Study and Virginia Operational Tests (\$407,348)**

The objectives of this activity are to conduct a detailed study of signal preemption/priority issues, and the state of the practice for transit, enforcement, fire and emergency medical services. Based on findings, this initiative will develop requirements and broad policy guidelines for signal preemption/priority for the Washington, D.C. region.

Subproject: Advanced Law Enforcement and Response Technology (ALERT) (\$500,000)

ALERT is an integrated in-vehicle platform for enforcement, fire, emergency medical services, and other specialty vehicles to provide enhanced public safety and improve incident response and management. ALERT is an on-going project sponsored by FHWA and other federal agencies; it is currently being deployed in the Washington, D.C. region in single vehicles owned by the City of Alexandria Police Department, U. S. Secret Service, and the U.S. Park Police. This project will expand use of these vehicles to Virginia and Maryland State Police agencies and several county police forces in Virginia and Maryland as well as the Washington, D.C. police.

Subproject: Enhance Partners in Motion (\$800,000)

The objectives of this activity are to implement Internet-based information technology applications to the Partners in Motion Agency Data Server. The current Agency Data Server will be updated with an Internet-based system to enhance participating agencies capabilities to transmit and receive traveler information. A six-month demonstration will be conducted to alert major employment centers of major transportation incidents impacting employees' ability to travel during business hours.

Subproject: Northern Virginia Regional Architecture (\$200,000)

This initiative will expand the Northern Virginia Regional ITS architecture to include agencies and jurisdictions in Northern Virginia which were not included in the previous undertaking to develop a regional framework.

Project Location: Washington, DC Metro Region

Partner(s): Virginia DOT, Maryland State Highway Administration, DC Dept. of Public Works, Metro Washington Council of Governments

Start Date: September 1999

End Date: December 2000

Integrated Systems – Individual Projects

NORTH DAKOTA STATE UNIVERSITY ADVANCED TRAFFIC ANALYSIS CENTER

Description:

The purpose of this project is to establish a center to provide a facility at which traffic analysis can be performed for second-tier cities (approximately 50,000-400,000 population). The center will also serve as a testbed at which systems designs developed at the center can be tested and demonstrated. These demonstrations can be used in conjunction with the simulation environment to offer effective training and hands-on experience for transportation professionals and elected officials. After four years, the center is intended to achieve financial independence by conducting research and service for second-tier cities. The center will create a simulated environment that will allow effective evaluation of existing and proposed traffic control plans using available software and hardware. Funding depicted includes FY 99 Earmarked appropriations.

Project Location:

Fargo, North Dakota

RESEARCH AND ANALYSIS SUPPORT FOR THE ITS PROGRAM

Description:

This is a renewed inter-agency agreement to provide support services for the FHWA ITS R&D program by the Oak Ridge National Laboratory (ORNL). Through this umbrella, parent contract, ORNL staff provides technical assistance in the development of ITS R&D programs, assists in the evaluation of proposal and contract deliverables, develops prototypes to determine the feasibility of high-risk research projects, and assists in the coordination of ITS-related research external to FHWA.

Separate project reports are available for the following tasks being performed under this contract under the following titles:

- ITS Deployment Analysis System (IDAS) – The objective of IDAS is to develop a sketch planning tool for use in assessing the incremental costs and benefits of adding ITS technology applications to a regional transportation network. IDAS uses outputs from traditional planning models to establish a baseline on which ITS-based capabilities may be added.
- Development of Interactive Traffic Network Data Editor for the Integrated Traffic Simulation System (ITRAF) – The objective of ITRAF is the development of a user-friendly input data pre-processor for two traffic simulation models developed by FHWA: CORSIM and CORFLO.
- Freeway System Capacity and Level of Service Analysis – This project is developing a new methodology to calculate the capacity and level of service for freeway systems and to prepare the appropriate chapter for the Highway Capacity Manual 2000.
- Special Report on Traffic Flow Theory – This task will expand and update Transportation Research Board Special Report 165 titled "Traffic Flow Theory" published in 1975. This revision will provide an updated survey of the most important models and theories which characterize traffic flows.

Project Location:

SUPPORT SERVICES FOR THE FHWA HUMAN FACTORS PROGRAMS

Description:

This contract provides support to FHWA's Human Factors Team to monitor off-site research contracts and conduct on-site research in the Turner-Fairbank Highway Research Center (TFHRC) Human Factors Laboratory facilities. A significant portion of the off-site contract research involves Intelligent Transportation Systems (ITS) studies. These are in the areas of Advanced Traveler Information Systems (ATIS), Commercial Vehicle Operations (CVO), In-Vehicle Information Systems (IVIS), Advanced Law Enforcement Response Technology (ALERT) and Advanced Traffic Management Systems (ATMS). Likewise, a large portion of the on-site research involves ITS studies. These are in the areas of ATIS, IVIS, ATMS and the integration of in-vehicle information with information coming from outside of the vehicle. The major products are ITS-related research reports, inputs to ITS design guidelines and standards, and inputs to ITS-related traffic models.

FAST-TRAC

Description:

FAST-TRAC (Faster and Safer Travel through Traffic Routing and Advanced Controls) will combine Advanced Traffic Management Systems (ATMS) and Advanced Traveler Information Systems (ATIS) technologies in Oakland County, Michigan. SCATS, the Australian adaptive real-time traffic control system is being installed throughout Oakland County, Michigan. Traffic detection for real-time traffic control is being provided through the Autoscope video image processing technology. For the ATIS portion of the test, vehicles were equipped with the Siemens Ali-Scout route guidance system and other drive information systems (Quick-Scout and TetraStar/PathMaster). Infrared beacons installed at critical locations in the network provided for a continuous exchange of real-time traffic and route guidance information. A Traffic Operations Center has been established, not only as the heart of FAST-TRAC operations, but also as the focus for systems integration.

MONTGOMERY COUNTY ADVANCED TRANSPORTATION MANAGEMENT SYSTEM

Description:

This project will enhance Montgomery County's Advanced Transportation Management System to provide integrated transit and traffic capabilities. The system will include an automatic vehicle location-equipped bus fleet, intelligent in-vehicle units, two-way communications, real time graphics, relational database, monitoring, and control software, transit priority and system information dissemination. Through use of this enhanced information and control capability, the County's Advanced Transportation Management System will be able to more effectively manage transportation.

ATLANTA, GEORGIA ITS COMPONENT INTEGRATION - PHASE I

Description:

This project integrates transit and public safety components with other transportation management or real-time, multi-modal traveler information systems through an implementation of center-to-center communications protocol. The project proposes to evaluate Common Object Request Broker Architecture (CORBA) as the preferred interface between centers.

In metropolitan areas, TEA-21 states that ITS Integration funding shall be used primarily for activities necessary to integrate intelligent transportation infrastructure elements that are either already deployed, or will be deployed with other sources of funds. The proposed project is an extension of the significant investment that all involved agencies have made in ITS deployment. Funded as a FY 99 earmark, initial stages of project activity will begin in January 2000.

Project Location:

Atlanta, Georgia

Partner(s):

Georgia DOT; City of Atlanta; Metropolitan Atlanta Rapid Transit Authority

COLORADO I-25 TRUCK SAFETY IMPROVEMENTS

Description:

This project is to fund the integration of ITS components in the Denver Metropolitan Area and along the interstates serving the greater Denver area. Included in the project will be the expansion and integration of the Colorado DOT and City of Colorado Springs traffic operations centers, and enhancements to incident management. This is part of a long-term, statewide, advanced transportation management and traveler information system - Colorado Transportation Management System (CTMS) contract. It is envisioned as a statewide multi-agency ITS network created to enhance Colorado surface transportation through the integration of existing and planned management, information, communications, and control systems; incorporating traveler information systems, traffic management systems, public transportation systems, commercial vehicle operations (CVO), and other local, regional and statewide initiatives.

Project Location:

Colorado

Partner(s):

Colorado DOT

Start Date:

October 1998

End Date:

September 2001

**Estimated Total
ITS Funds:**

CORPUS CHRISTI, TEXAS, INTEGRATION OF INTELLIGENT TRANSPORTATION SYSTEMS

Description:

This project proposes to develop a Corpus Christi Regional ITS Architecture and Deployment Plan. It also proposes to establish the base for an Intelligent Transportation System in the Corpus Christi Metropolitan Area. The project will expand or implement traffic signal, freeway, emergency, transit, and special event management capabilities. The system will implement a mesh network topology with decentralized operations. Plans are to involve all agencies involved in transportation and/or incident management.

Specific areas of focus for the project once the Regional ITS Architecture is developed, are the establishment of a fiber-based communication backbone and the expansion of the existing fiber network integrating other key operating agencies such as the Regional Transportation Authority; City of Corpus Christi Police Department; Fire Department, Street Department; Department of Public Safety and the Regional Terminal Fire Company; and establishment of a Traveler Information System on regional freeways. Major elements will be dynamic message signs, highway advisory radios and surveillance cameras.

Project Location:

Corpus Christi, Texas

Partner(s):

City of Corpus Christi; Nueces County; Local Emergency Planning Committee; Regional Transportation Authority; Refinery Terminal Fire Company

Start Date:

September 1999

End Date:

December 2001

Estimated Total ITS Funds:

\$712,323

Estimated Total Project Cost:

\$1,425,000

DEL RIO, TEXAS INTEGRATION OF INTELLIGENT TRANSPORTATION SYSTEMS

Description:

This project will develop an ITS plan for the Del Rio area which allows for maximizing integration of ITS infrastructure. The plan will provide the outline of the phasing of tasks including, but not limited to the following:

- Establishment of a local point of ITS data centralization and two-way communication capabilities between a local transportation management center (TMC) with the TransGateway TMC in Laredo, Texas.
- Strategic upgrades to TransGateway to facilitate regional integration between Del Rio and TransGateway.
- Implementation of integration strategies focused on incident management-particularly remote flood-sensing and signal preemption applications, and commercial vehicle operations.

Project Location:

Del Rio, Texas

Partner(s):

Texas DOT; Dept. of Treasury; U.S. Customs Service; U.S. Border Patrol; Middle Rio Grande Council of Governments; Del Rio Fire and Rescue; Del Rio Police Dept.; Val Verde County

Start Date:

September 1999

End Date:

GREAT LAKES IMPLEMENTATION

Description:

The Great Lakes Implementation project is focused on Wisconsin. The State of Wisconsin will accomplish deployment planning and begin implementation of national architecture conformity, integrated systems along urban corridors in the southeastern Wisconsin region, multi-agency traffic and emergency response management and incident management planning in the greater Milwaukee area. This involves developing a region-wide programmatic, project development and budgeting approach over a recurring six-year time frame. This effort will concentrate on funding projects in the 1999, 2000 and 2001 state fiscal years.

The intent of the Great Lakes earmark project level deployment effort is to support an accepted, standardized approach to deployment throughout the southeastern Wisconsin region. That program effort will also conform to an integrated statewide plan. This was the first segment of a calibrated approach to developing a strategic statewide ITS plan involving comprehensive internal and external stakeholder education and outreach. This program has evolved from the Milwaukee MONITOR system and the three-state Gary-Chicago-Milwaukee priority corridor program. The southeastern Wisconsin program is the most sophisticated of the statewide ITS efforts, involving the integration of a legacy system (MONITOR) with those of two other states in the region (ADVANCE in Illinois and Borman in Indiana).

Project Location:

State of Wisconsin

Partner(s):

Wisconsin DOT; Wisconsin Department of Motor Vehicles; Wisconsin State Patrol; Wisconsin Divisions of Business Management, Investment Management, Infrastructure Development

Start Date:

September 1999

End Date:

March 2001

I-880/SR 17 SMART CORRIDOR IMPROVEMENTS-SILICON VALLEY, CALIFORNIA

Description:

A Concept of Operations has been developed for the I-880/SR 17 corridor for Santa Clara County through the Silicon Valley Smart Corridor project effort. The I-880/SR 17 corridor extends from the City of Milpitas in the north to the Town of Los Gatos in the south, a corridor having an end-to-end length of about 15 miles. The I-880/SR 17 Smart Corridor Improvements project consists of elements that support integration and information sharing among and across ITS subsystems. One component of this project is to provide an upgrade of the existing data exchange network (DEN) to comply with the National Transportation Communications for ITS Protocol (NTCIP) center-to-center (C2C) communications protocol. This upgrade and others are to be consistent with the national ITS architecture and standards. It is expected that these improvements will facilitate future integrations with transit, future efforts to provide more travel information to the public and portability of the system to system communications software to other jurisdictions both in the County and elsewhere.

The FY 99 Integration Program funding will be used to integrate advanced technologies and real-time system management techniques, including closed circuit television, message signs and coordinated signal timings. This will improve the traffic management capabilities on freeways, arterials and transit operations within the corridor.

Project Location:

Santa Clara County, California

Partner(s):

Cities of Campbell, San Jose, Milpitas, Santa Clara, Fremont; Santa Clara County; Town of Los Gatos; Santa Clara Valley Transportation Authority (VTA); Caltrans, California Highway Patrol; Alameda County Congestion Management Agency

Start Date:

September 1999

End Date:

July 2001

INTELLIGENT TRANSPORTATION SYSTEMS INTEGRATION PROJECT FOR TRANSPORTATION OPERATORS IN SOLANO COUNTY

Description:

Seven public agencies in Solano County, California, combine resources to provide a diverse and complete transportation infrastructure for their citizens. Services include local, intercity and express commuter general public fixed route bus, water ferry, general public demand response bus, and senior and handicapped demand response bus. These services are provided through a combined fleet of approximately 120 vehicles. Although two of the agencies are providing local service primarily, the other five provide regional services which operate between Solano and one or more surrounding counties. This project is designed to coordinate the development and implementation of a single Y2K compliant intelligent transportation system (ITS), for the seven operators based in Solano.

Project approach will be oriented to the development of a flexible and expandable base architecture. The goal is to allow the system to be dynamic and grow in capability and complexity over time. The initial work will be oriented to developing the Global Positioning System (GPS) capacity, such as Automated Vehicle Location (AVL) and on-time performance analysis. Secondary and tertiary enhancements could include expanded transit applications, as well as general traffic engineering and vehicle safety applications. National ITS Architecture Standards shall be used to develop this ITS.

Project Location:

Solano County, California

Partner(s):

Cities of Fairfield, Benicia, Dixon, Rio Vista, Suisun City, Vacaville

Start Date:

ITS IMPROVEMENT PROJECT FOR NIAGARA INTERNATIONAL TRANSPORTATION TECHNOLOGY COALITION (NITTEC) AND WESTERN NEW YORK INCIDENT MANAGEMENT

Description:

The purpose of this project is to further the ITS Integration efforts started under previous projects. The project will continue the integration of member agencies of NITTEC, begin to integrate the Western New York Incident Management Team, demonstrate the effectiveness of Video Incident Detection based on neural network technology, integrate an Automated Collision Notification (ACN) System, integrate local police automated vehicle location (AVL) systems, integrate a queue-end warning system, and provide integrated emergency management.

Project Location:

Buffalo, New York

Partner(s):

Niagara International Transportation Technology Coalition including: New York Department of Transportation; New York State Thruway Authority; Niagara Falls Transportation Authority; City of Buffalo; City of Niagara Falls, NY; City of Niagara Falls, Ontario; Erie County; Niagara County; Town of Fort Erie, Ontario; Regional Municipality of Niagara, Ontario; Niagara Parks Commission; New York State Police; Niagara County Sheriff; Erie County Sheriff; Ontario Provincial Police; Greater Buffalo Niagara Regional Transportation Council; AAA of Western NY; Metro Networks

LAREDO, TEXAS, INTEGRATION OF INTELLIGENT TRANSPORTATION SYSTEMS

Description:

The City of Laredo, Texas is experiencing rapid population growth and increases in vehicle traffic. It is projected that in the year 2000, the Port of Laredo will handle approximately 21 million vehicles. This project seeks to integrate a variety of ITS infrastructure components deployed in the Laredo area. The primary goal of the project is to accomplish as much integration and achieve as much system level functionality as possible within funding levels. Major project components include:

- Development of an ITS area plan.
- Establishment of a fiber-based communications network connecting key operating agencies.
- Strategic upgrades to the TransGateway System enabling the area Transportation Management Center to function as a central repository and distribution point for transportation-related data, as well as to communicate with the Del Rio system.
- Development and installation of an automated traffic management system that provides single operator interface to video management and control systems, traffic monitoring and alarm systems, and motorist information systems such as dynamic message signs, lane control sign, highway advisory radios and communication management system.
- Development of systems monitoring and diagnostic routines to alert operators to actual or pending component failures and to allow operator remote diagnostic and troubleshooting capabilities--takes limited manpower resources into account.
- Design and implementation of a system that provides for sharing information between agencies with minimum of manual interface. Use automated analysis and alarms to notify operator, develop scenario based incident responses and use outside local agency on evening and weekend operations.

Project Location:

Laredo, Texas

Partner(s):

Texas Department of Transportation, City of Laredo, Texas Department of Public Safety, U.S. Customs, Laredo Bridge System, Mercy Regional Medical Center, Laredo Truckers Association

Start Date:

MOBILE, ALABAMA FOG DETECTION SYSTEM

Description:

This project will expand the fog detection and tunnel management system into a full incident management system on the seven-mile Bay Bridge and other segments of I - 10 through Mobile, Alabama.

Project Location:

Mobile, Alabama

Partner(s):

Alabama DOT

Start Date:

September 1996

End Date:

September 2000

**Estimated Total
ITS Funds:**

\$5,000,000

**Estimated Total
Project Cost:**

\$6,500,000

MONTGOMERY, ALABAMA INTELLIGENT TRANSPORTATION SYSTEM

Description:

The principal objective of this project is the creation of a communications infrastructure to help integrate the highway, emergency services, and transit agencies in the Montgomery area. The project intends to connect CCTV cameras, vehicle detection system capabilities, dynamic message sign control software, advanced traffic signal control, incident/congestion tracking and management and GPS for transit on demand vehicles.

This project lays the foundation for the phased development of the Montgomery area ITS. The key components of the Montgomery ITS system as envisioned are:

1. Providing communications links to all stakeholders via a fiber optic network.
2. Providing real time information on congestion and incidents to stakeholders. This will require software to "flag" incidents and provide a graphic illustration of congestion levels throughout the Montgomery system.
3. Managing incidents through improved response times and efficiencies. An incident response/diversion plan will be developed with input from all primary stakeholders.
4. More efficiently managing the demand responsive transit system in place in Montgomery. Use of the incident/congestion information and GPS for transit vehicle location is proposed.

Project Location:

Montgomery, Alabama

Partner(s):

Alabama DOT, City of Montgomery

Start Date:

September 1999

End Date:

November 2000

Estimated Total ITS Funds:

\$989,337

Estimated Total Project Cost:

\$2,780,700

NEW YORK CITY MULTI-OPERATING AGENCY INTEGRATED TRANSPORTATION MANAGEMENT SYSTEM (ITMS)

Description:

This project is a component of the development, implementation and operation of an integrated multi-agency transportation system. The focus of the Integrated Transportation Management System (ITMS) will be integration of communications and operations. The project is phased into two tasks:

- Design and implementation of ITMS;
- Design and implementation of an ITS Archive/Planning Subsystem for New York City with a focus on developing an integrated repository for historical data generated by the ITMS.

Project Location:

New York City, New York

Partner(s):

New York State DOT; New York City DOT; TRANSCOM; Metropolitan Transit Authority

Start Date:

September 1999

End Date:

October 2001

**Estimated Total
ITS Funds:**

\$1,978,674

SALT LAKE VALLEY ATMS SYSTEMS INTEGRATION

Description:

This project will integrate the various physical components and develop other support systems for the Salt Lake Valley Advanced Traffic Management System (ATMS) operation, a fully functional system between the Utah DOT, Salt Lake City and Salt Lake County. The system integrator is responsible for the overall implementation and operation of all the various system components which are being deployed for the ATMS. The field equipment, communication facilities and control centers are being implemented by four different ATMS projects. The ATMS will provide integrated, multi-agency, multi-modal traffic management capabilities to support the safe and timely movement of people and goods in the region. The system will support network surveillance, surface street control, freeway control, HOV lane management, traffic information dissemination, regional traffic control, and incident management.

The system integrator will coordinate the work of this project with the efforts of the consultants and contractors for the other four projects which are being implemented for the other portions of the ATMS. This will ensure operational compatibility among the various field elements, central control centers and corresponding elements. The project will implement a traffic signal system to provide central monitoring and control capabilities within the Salt Lake Area. The project will use the 2070 controller firmware to provide local processing of freeway detectors and ramp meter control. The Salt Lake County control center will use Georgia DOT software. Other activities to be completed as a part of this project include integrating ATMS with the DOT Public Safety dispatch system, develop real-time data exchange with Utah Transit Authority prototype signal priority projects, develop a regional ITS Architecture, and enhance functionality of UDOT's winter maintenance by integrating RWIS with snowplow AVL and ATMS.

Project Location:

Salt Lake Valley, Utah

Partner(s):

Utah DOT, Salt Lake City, Salt Lake County

Start Date:

September 1997

End Date:

December 2001

SAN FRANCISCO, CALIFORNIA INTEGRATED TRANSPORTATION MANAGEMENT SYSTEM PROJECT

Description:

The San Francisco Integrated Transportation Management System (ITMS) is a city-wide real-time transportation management system which includes various ITS infrastructure components suited for traffic conditions unique to San Francisco. The system when completed will provide the following benefits:

- Improved traffic flow and safety;
- Reduced congestion;
- Availability of real-time traffic information to motorists;
- Improved responsiveness to planned events and incidents;
- Enhanced communications.

Several key concepts to be implemented through the ITMS project include:

- Development and implementation of an integrated network to exchange data and video feeds, and improvement of cross-jurisdictional response capabilities.
- Providing the foundation for inter-agency coordination and operation with Caltrans/CHP TMC and MTC TravInfo. The TMC and TravInfo play an important role in empowering the San Francisco Bay Area region with the most advanced transportation management tools to optimize use of transportation facilities in the region.
- Providing the necessary functional requirements for other local/regional jurisdictions to interface their ITS elements with those of San Francisco.

Project Location:

San Francisco, California

Partner(s):

California Department of Transportation (Caltrans), California Highway Patrol (CHP), Metropolitan Transportation Commission (MTC) TravInfo, MUNI (San Francisco Public Transportation Department), San Francisco 911 Emergency Center, City of Daly City, Golden Gate Transit, AC Transit

Start Date:

September 1999

End Date:

September 2001

Estimated Total ITS Funds:

\$1,187,000

Estimated Total Project Cost:

\$4,110,000

ST. LOUIS REGION SMART INTEGRATED METROPOLITAN AREA MAP

Description:

The objective of this project is the development of a Smart Integrated Metropolitan Area Map for the St. Louis region. The development of a common base automated map display that can be used to disseminate information to all local transportation service providers and partners is a critical step in the development of an integrated regional transportation network.

Information from freeway, incident and corridor management subsystems will be displayed on this common base map. It will be a key part to this region's transportation integrated network. The St. Louis Metropolitan Planning Organization (East West Gateway Coordinating Council - EWGCC) region extends into two states and has over 100 local governmental entities. The following developmental components of this common base map are:

- Identification of User Needs - Data Collection
- Establishment of Mapping Requirements
- Development of Architecture and Design
- Digitalization of Transportation Facilities
- Testing and Evaluation
- Deployment to Regional Partners
- Maintenance of Map

Many agencies presently need and use mapping information in the St. Louis Metropolitan Area. They have developed their own base maps to reflect the many different services they provide (water, sewer, transportation facilities, etc.). These activities will be expanded and enhanced to develop an integrated map.

With the Intelligent Transportation System about to become a reality in the area, a need for a base map that would match the maximum number of jurisdictions (with well over 100 local agencies) is highly desirable. The standard setting inherent in this map will both identify the current differences, confirm interfaces or modifications, and allow entry anywhere on the system. This would reduce or eliminate data re-entry to provide the regional information.

Project Location:

St. Louis Region

Partner(s):

Missouri DOT, Illinois DOT, The East West Gateway Coordinating Council, St. Louis Metropolitan Planning Organization

Start Date:

September 1999

STATE OF MISSISSIPPI ITS INTEGRATION PROJECT

Description:

The Mississippi Department of Transportation is currently working on two projects to be funded by ITS funds. These projects are as follows:

- The MDOT Office of Enforcement in collaboration with the Planning Division will fund an additional Weigh In Motion Site (WIM). This new site, in conjunction with the other 19 sites, will provide vehicle data to all participating project partners.

- A Statewide feasibility study will be conducted to help determine traffic needs that can be enhanced with the implementation of an ITS. The study will look into all aspects of transportation and will consider benefits to the MDOT as well as the traveling public. These implementations to the traffic network will be shown using the National ITS Architecture. The consultant will also research means to make WIM available, via the internet or through a database, to all partners.

Project Location:

State of Mississippi

Partner(s):

Mississippi DOT, Mississippi Public Service Commission, Mississippi Trucking Association

Start Date:

September 1999

End Date:

December 2000

STATE OF NEW JERSEY

Description:

This project proposes that TRANSCOM, the coalition of 15 transportation agencies in the New York/New Jersey/Connecticut region which provides a cooperative, coordinated approach to regional transportation management, expand one of its major systems - TRANSMIT. TRANSMIT is TRANSCOM's System for Managing Incidents and Traffic. TRANSMIT integrates the region's electronic toll system (E-Z Pass) with traffic and transit operations by using E-Z Pass toll tags as probes to calculate travel times and to detect incidents.

Under this project, TRANSCOM will integrate the already operational TRANSMIT system across jurisdictions, agency and geographic boundaries, modes and ITS functions using the existing TRANSCOM Regional Architecture. This latest phase in the planned extension of TRANSMIT throughout the TRANSCOM region involves installing readers on a number of key highways under the jurisdiction of the NJDOT, the Garden State Parkway and the NJ Turnpike. It also includes providing readers at all 18 NJ Transit bus garages to monitor the movement of NJ Transit buses and to expand TRANSMIT's bus management component throughout New Jersey. This project will: enhance TRANSCOM's incident detection capabilities; increase the real-time traffic information available to TRANSCOM members and, via iTravel, to businesses, organizations, and individuals; create the capability to monitor in real-time agencies' traffic diversion efforts; expand NJ Transit's bus management system statewide; and provide origin and destination data for transportation planning.

Project Location:

New Jersey

TUSCALOOSA, AL, TRAFFIC INTEGRATION AND FLOW CONTROL

Description:

Tuscaloosa currently has an Advanced Traffic Management System that consists of a fiber-optic trunk line, an integrated multiple closed loop system and 8 CCTV cameras on major arterials. This system was developed using only local funds with a \$150,000 grant from AL DOT. This project will expand this system to include 20 additional CCTV cameras, extend the fiber-optic line, install non-freeway applications of variable message signs, expand the geographic information system to include traffic data and, via extended fiber-optic line, integrate the local Emergency Management System and include real-time traffic congestion data.

Project Location:

Tuscaloosa, Alabama

Partner(s):

Alabama DOT

Start Date:

October 1998

End Date:

December 2001

**Estimated Total
ITS Funds:**

ADVANCE

Description:

ADVANCE (Advanced Driver and Vehicle Advisory Navigation Concept) was a cooperative effort to evaluate the performance of a large-scale in-vehicle navigation and dynamic route guidance system. Initially, 3,000 private, commercial and public agency vehicles in the northwestern suburbs of Chicago were scheduled to be equipped with in-vehicle navigation and dynamic route guidance systems. Early in FY 1995, the partnership became concerned with issues that surfaced involving development of the system and the status of the overall in-vehicle navigation and dynamic route guidance system market in this country. The issues were further refined and quantified and several deployment options were developed and evaluated. The Steering Committee at a meeting in late February 1995, unanimously approved the recommended targeted deployment option. A significant portion of the original project goals and objectives were met under targeted deployment. This option allowed for limited, specific testing of the in-vehicle navigation and dynamic route guidance system in a controlled environment at a significantly lower budget. Based on revised project goals and objectives, in-vehicle testing for the targeted deployment phase was completed in December 1995 using approximately 75 vehicles; 32 of these vehicles (project vehicles) were deployed for testing and evaluation. Eighty local households participated in a test of the system and their reactions were favorable. Vehicles served as probes, providing real-time traffic information to a Traffic Information Center (TIC). This information was processed and transmitted to the equipped vehicles and used to develop preferred routes. The routing information was presented to the driver in the form of dynamic routing instructions. An evaluation plan for ADVANCE based on targeted deployment was developed, adopted, and implemented. The evaluation was completed and the results were made available to the general public in January 1997. The Steering Committee also concurred in the further development and modification of the ADVANCE TIC (application phase of ADVANCE) so it can serve as the Corridor Transportation Information Center (C-TIC) for information dissemination efforts for the Gary-Chicago-Milwaukee (GCM) ITS Priority Corridor.

ANN ARBOR SMART INTERMODAL

Description:

This project supported the Ann Arbor Transportation Authority's (AATA) conduct of an operational test of the Smart Bus concept. Included are an on-board bus communication and navigation system, a central control system, and a "Smart Card" fare collection system. The on-board system monitors actual performance in regard to route, location, speed and status of mechanical systems. It allows control of on-board electronics, such as the fare collection system, destination sign and enunciator. The on-board system also enables buses to interact with traffic signal preemption devices and to communicate with the central control system. The central control system integrates the data from the bus fleet for coordinated supervision, and also provides real-time transit information to the public. The "Smart Card" fare system provides a dual farecard/parking pass to encourage auto drivers to ride transit by providing them with an easy, cost-saving method for fare payment.

APTS TECHNOLOGY RESEARCH

Description:

Under this project, various new technologies were evaluated for their potential benefit to transit and studies were performed to support and facilitate the application of the technologies to public transportation. Studies performed addressed transit system architecture requirements, human factors issues, frequency spectrum requirements and allocations, multi-modal fare/toll payment smart cards, automatic vehicle monitoring and management system implementations, and map and spatial database requirements. This technical support included research and technical assistance to transit authorities implementing APTS technologies.

ATLANTA ATIS-KIOSK PROJECT

Description:

The Atlanta Traveler Information Kiosk project focuses on Traveler Information statewide. The project provides Traveler Information at a variety of locations including rest areas, welcome centers, shopping, employment, and lodging centers. The Kiosks are operated by Georgia Net, a Georgia state authority responsible for dissemination of various types of information. The evaluation for the project was led by Oak Ridge National Laboratory, along with the Georgia Institute of Technology, Clark-Atlanta University, and Concord Associates. A User Acceptance Test Report was produced by the evaluators. A network of 130 statewide deployed kiosks provide real-time traveler information including incident and congestion information, route planning, transit information, and more.

Project Location:

ATLANTA TRAVELER INFORMATION SHOWCASE

Description:

The Atlanta Traveler Information System (TIS) project provides timely transportation information to travelers in the Atlanta metropolitan area through the use of Personal Communication Devices (PCDs), in-vehicle navigation devices, on-line computer information services, interactive television in selected hotels, and cable television. This information is available to both residents and visitors for trip planning purposes. The project was operational before, during, and after the 1996 Summer Olympic and Paralympic Games. The TIS includes information on multimodal travel options, including bus, rail and air travel. The TIS also includes an extensive public information campaign. The Showcase project successfully transferred all of the devices to the Georgia DOT for incorporation as legacy devices in the Statewide ITS. The Personal Communication Devices and the in-vehicle navigation devices are the only devices that are currently not being supported.

BARBOURSVILLE-ONA, WEST VIRGINIA TRAFFIC MANAGEMENT

Description:

This project consisted of improving access to and from the Huntington Mall and other properties located along US Route 60 and Mail Road (Cabell Co. 60/89). The Huntington Mall Road is a heavily traveled road with a 1995 Average Daily Traffic of 23,600 vehicles weekdays and 40,000 vehicles per weekend. The Huntington Mall Road begins at US Route 60 as a three-lane roadway and proceeds north under the I-64 bridge where it becomes a five-lane roadway section with four lanes northbound and one lane southbound. Immediately north of the westbound entrance ramp and the westbound exit ramp intersections, the road consists of seven lanes with five lanes northbound and two lanes southbound.

BORMAN EXPRESSWAY ADVANCED TRAFFIC MANAGEMENT SYSTEM (ATMS) PHASE I

Description:

INDOT, in conjunction with Hughes Transportation Systems, JHK, and Avilla, developed and installed a functioning prototype Advanced Traffic Management System (ATMS) deploying several of the more promising electronic sensors and integrating them into the prototype using spread spectrum radio communications. The equipment was independently evaluated for dependability and cost effectiveness by Purdue University before being incorporated into the permanent ATMS that will be constructed in a later phase. The Borman ATMS has become an essential component of the Gary-Chicago-Milwaukee, Midwest ITS Priority Corridor.

Project Location:

The Borman ATMS is a part of the Gary-Chicago-Milwaukee, Midwest ITS Priority Corridor

Partner(s):

Federal Highway Administration (FHWA), Indiana Department of Transportation (INDOT)

Start Date:

July 1994

End Date:

December 1996

**Estimated Total
ITS Funds:**

\$550,000

**Estimated Total
Project Cost:**

\$1,750,000

Dan Shamo	Indiana DOT	(219) 362-6125

BOSTON SMARTRAVELER

Description:

The project tested the public acceptance and potential traffic impacts of a telephone-based audiotext traffic information service. An independent evaluation of the project was done and the final report is available. The project has moved beyond operational testing using other funds.

Project Location:

Boston, Massachusetts

Partner(s):

Project contributors include the Massachusetts Highway Department, SmartRoute Systems. Several local radio and television stations donated advertising and promotion for the project

Start Date:

September 1992

End Date:

December 1994

**Estimated Total
ITS Funds:**

\$1,515,000

**Estimated Total
Project Cost:**

\$3,395,000

BUFFALO/NIAGARA FALLS ATMS

Description:

This project provides for a variety of travel management enhancements to include: installation of a road weather information system and variable message signs; establishment of a weather advisory for a local bridge; an enhanced traffic operation center computer system; and freeway management capability in the Buffalo area. This was the first of several planned phases to establish a complete freeway management system in the Buffalo/Niagara Falls area.

Project Location:

Buffalo, New York

Partner(s):

New York State Department of Transportation (NYSDOT)

Start Date:

May 1995

End Date:

March 1998

Estimated Total ITS Funds:

\$2,000,000

CALIFORNIA SMART TRAVELER

Description:

This project was comprised of two components: (a) Los Angeles Smart Card, and (b) Orange County Smart Intermodal System. The Los Angeles Smart Card tested the use of smart cards for express transit services as well as for parking and other services at employment sites. Two different card technologies were tested: a contact card and a radio frequency (RF) proximity card. The Orange County Smart Intermodal System operationally tested (1) an integrated transit and traffic management system and (2) a real-time information system that included special event information.

Project Location:

Los Angeles and Orange County, California

Partner(s):

Los Angeles Metropolitan Transportation Authority (LAMTA), Volpe National Transportation Systems Center, Aegis Transportation Information Systems, Inc., Merced County Council of Government, University of California, and California DOT (Caltrans)

CAPITAL: WASHINGTON, D.C. AREA OPERATIONAL TEST

Description:

This ITS Operational Test made extensive use of the existing cellular infrastructure for both areawide surveillance and communications. Engineering Research Associates (ERA) equipment was collocated on Bell Atlantic Mobile towers to detect cellular usage and geolocate phones on designated roadways. Specific evaluation goals included determination of the accuracy of geolocation data; the accuracy and completeness of traffic information; the usefulness of passive statistical processing for measuring volume and incidents; the criteria for selecting roadways that can be monitored by these techniques; system capabilities; costs for deployment; public acceptance; and the usefulness of information dissemination to fleet vehicles.

Project Location:

Washington, District of Columbia Metropolitan area

Partner(s):

Virginia DOT and Maryland State Highway Administration, Raytheon E Systems, Bell Atlantic NYNEX Mobile, and PB Farradyne

Start Date:

August 1993

End Date:

June 1997

CHART STRATEGIC PLAN - MARYLAND

Description:

This study developed a strategic plan for statewide deployment of ITS. CHART is Maryland's statewide transportation management program. This specific study developed a CHART strategic plan. Two areas that received emphasis are traffic management strategies and communications alternatives. The effort initially concentrated on congestion management in the Baltimore-Washington corridor. Both current and future needs were evaluated, including the application of ITS technologies and services. This project also provides for CHART systems integration using Congestion Mitigation Funds.

Project Location:

Maryland

Partner(s):

Maryland State Highway Administration

Start Date:

December 1992

End Date:

May 1996

**Estimated Total
ITS Funds:**

DELAWARE COUNTY RIDETRACKING

Description:

This project developed and evaluated an automated identification and billing system (AIBS) for paratransit service. The AIBS automates existing processes using advanced technology for the identification of passengers, the accounting and billing data collected on each passenger trip, the reporting required for coordination with various transportation suppliers and internal performance monitoring. Elimination of manual processes, including eligibility verification and reconciliation of trip information for billing purposes, resulted in system efficiency and cost saving.

Project Location:

Delaware County, Pennsylvania

Partner(s):

EG&G Dynatrend

Start Date:

June 1994

End Date:

July 1998

**Estimated Total
ITS Funds:**

\$200,000

**Estimated Total
Project Cost:**

DETECTION TECHNOLOGY FOR ITS

Description:

This contract developed functional and performance specifications for permanently deployed and portable vehicle detectors in ITS applications. Candidate vehicle detector technologies were evaluated through laboratory and field testing of currently available state-of-the-art detectors. Such detectors include ultrasonic, infrared, microwave radar, video image processors, magnetometers, and inductive loops. In some instances, commercially available detectors did not meet ITS specifications. In these cases, functional requirements were developed for the detectors. Another part of the study dealt with determining if a permanent national vehicle detector test facility is needed to provide vehicle detector test data for future commercial vehicle detectors used in ITS. The executive summary for this project can be found on the internet at www.tfhrc.gov.

DETROIT, MICHIGAN AREAWIDE DEPLOYMENT OF ATMS/ATIS

Description:

The Michigan DOT has completed a comprehensive ATMS/ATIS Early Deployment Plan for expansion of the existing 32.5 miles of instrumented freeway coverage to 250 miles in Metropolitan Detroit. The deployment undertaken in Phase One has expanded the system coverage by 150 miles, and provides the Michigan Intelligent Transportation Systems (MITS) Center in Detroit with the capability to monitor traffic and congestion through the use of mainline traffic detectors (loops and machine vision), ramp metering and video surveillance. Traveler information is provided via highway advisory radios and changeable message signs. The implementation of the ATMS/ATIS system provides the Michigan DOT the means to detect and verify incidents on selected corridors in a timely manner, to provide traffic operations personnel sufficient data to respond to incidents and to disseminate traffic and congestion information to motorists so they can plan or modify their travel plans. Additionally, the system has the capability to manage mainline work zones, calculate mainline volume demand and predict traffic flow patterns for special events, planned work/construction zones, and other special events. The corridors which were deployed include selected segments of Interstates 75, 94, 96 and 696, and the M-10 and M-39 freeways.

Project Location:

Detroit, Michigan metropolitan area

Partner(s):

DETROIT TRANSPORTATION CENTER TRANSIT INFORMATION

Description:

This was a joint FTA/FHWA project that provided real-time traffic condition information to dispatch centers of public transit agencies in the Detroit area. MDOT's Detroit Freeway Operations Center collected traffic information on 32 miles of freeway through a buried inductive loop system. The information was then graphically displayed on computer monitors by color coding individual freeway segment (link) speeds. This project demonstrated the ability to provide the information to public and private transit operators inexpensively, and then monitored performance changes and evaluated the results.

Project Location:

Detroit, Michigan

Partner(s):

City of Detroit and Michigan DOT

DIRECT

Description:

DIRECT (Driver Information Radio using Experimental Communication Technologies) was an Operational Field Test that deployed and evaluated several alternative low-cost methods of communicating advisory information to motorists. These included use of the Radio Broadcast Data System (RBDS)/FM subcarrier (SCA), Automatic Highway Advisory Radio (AHAR), Low Power Highway Advisory Radio (HAR), and cellular phones. The Michigan Intelligent Transportation Systems (MITS) Center collected traffic information from various sources, fused the information and provide traffic advisory updates to travelers on an exception basis. Initial experimental testing involved 30 specially-equipped vehicles.

Approval for a phase II of this project has been granted with no additional Federal funding. In phase II, Michigan DOT and the University of Michigan will form a partnership to leverage residual Federal funding to field test the potential for using RDS entertainment radio for both emergency warnings from speeding emergency vehicles or in-line maintenance vehicles via the Emergency Radio Data System, and for delivering trip-specific traffic alerts of incidents from the Traffic Management Center. Phase II of this project will commence in FY 2000, and will be called DIRECT - Phase II.

EVALUATING ENVIRONMENTAL IMPACTS OF ITS USING LIDAR

Description:

This test combined Light Detection and Ranging (LIDAR) technology for wide area emissions detection with active infrared technology for roadside emissions detection to evaluate changes in air quality due to implementing traffic responsive control strategies for events at a sports complex. The objectives were to: (1) measure the effect of MnDOT's Portable Traffic Management System on air quality, (2) determine the ability of LIDAR technology to provide quantitative and qualitative air quality data, and (3) assess the overall effectiveness of LIDAR as an evaluation tool.

EVALUATION OF REAL-TIME TRAFFIC ADAPTIVE SIGNAL CONTROL PROTOTYPES

Description:

This study focused on the evaluation of five real-time traffic adaptive signal control prototypes previously developed. The evaluation consists of three phases: conceptual evaluation, laboratory evaluation, and field evaluation. The conceptual evaluation established the validity of the prototypes' overall concept. The laboratory evaluation tested each prototype in a simulated environment against an optimal baseline case study. Various scenarios were evaluated including a high type arterial, a small grid network, a complex grid network, and a cluster network. The field evaluation implemented and evaluated a promising prototype strategy within the overall Real-Time Traffic Adaptive Control System.

FM/SCA PROTOTYPE FOR TRAFFIC INFORMATION BROADCAST

Description:

This project involved the test and evaluation by an industry organization of the prototype Subsidiary Communications Authorization (SCA) Traffic Information Channel (STIC) waveform. A system based on this waveform will allow a commercial FM broadcast station's subcarrier to transmit traffic and other data at rates higher than previously achieved. The data rate for this system will be high enough to support broadcast of individual link travel times (e.g., for routing applications). The completed prototype transmission and reception scheme will be tested using mostly off-the-shelf equipment in several diverse areas to assess concept feasibility. The equipment, developed by Mitretek Systems, under contract to FHWA over the last several years, was built to meet the specific requirements of ITS, but has application for other data broadcast scenarios.

FUEL CONSUMPTION AND EMISSION VALUES FOR TRAFFIC MODELS

Description:

The Oak Ridge National Laboratory (ORNL) developed a database of on-road fuel consumption and emissions for eight late model vehicles, as a function of vehicle speed and acceleration. These vehicle "maps" were developed for use in simulation models that evaluate strategies to enhance roadway design, traffic control, and ITS concepts. The maps permit simulation models to calculate the energy and emission impacts of highway traffic improvements.

GENESIS

Description:

Genesis is an advanced traveler information system (ATIS) that uses personal communications devices (PCDs) to distribute information. Timely delivery means gathering the data in real-time and distributing the data to travelers when they need it, where they need it and how they need it. Genesis is an element in the Minnesota Guidestar ITS program. With transit and traffic data, Genesis is able to provide the urban traveler with current data relevant to a chosen trip mode and route. The Genesis PCD is portable and transit information is fully accessible to the user.

HUMAN FACTORS PROGRAMS: ADMINISTRATIVE AND TECHNICAL SUPPORT

Description:

This effort focused on providing the necessary staffing and expertise required to assist the FHWA's Human Factors group in conducting and monitoring research efforts on various ITS subsystems. These studies included human factors investigations in Advanced Traffic Management Systems (ATMS), Advanced Traveler Information Systems (ATIS), Automated Highway Systems (AHS), and Commercial Vehicle Operations (CVO). On-site staff research areas include In-Vehicle Signing (IVS) and In-Vehicle Safety Advisory Warning Systems (IVSAWS).

The major contractual efforts (involving ATMS, ATIS, and AHS) were being monitored in regard to critical analytical, empirical and integration human factors issues that will result in design guidelines addressing the specific and integrated ITS areas. The empirical aspect was of pivotal importance in that numerous simulation and field research studies will be conducted and analyzed to provide specific human factors research results that will be transformed into design guidelines and computer-aided design packages. In-house ITS research staff projects are also developed, managed, and monitored as part of the Human Factors Research Program. Significant human factors ITS knowledge gaps that are identified will be addressed through contract or staff research.

INCIDENT DETECTION ISSUES - PART I : FREEWAYS

Description:

The "Incident Detection Issues - Part I (Freeways)" project developed a support system in three modular parts. The first part developed malfunction management techniques to help provide useful data under conditions of detector component failure. The second part developed algorithms to take the information and develop a "current status" of the network. The third part developed algorithms that will detect an incident when there are significant discrepancies in the predicted/expected overall network operating status.

INTELLIGENT CORRIDOR SYSTEM

Description:

The Southeast Florida Intelligent Corridor System (ICS) integrates the elements of Advanced Traffic Management Systems (ATMS), Advanced Traveler Information Systems (ATIS), Advanced Public Transportation Systems (APTS), Commercial Vehicle Operations (CVO), and Advanced Vehicle Control and Safety Systems (AVCSS). The extensive intermodal aspects of the I-95 corridor within Palm Beach, Broward, and Dade Counties are a priority in the development of the ICS. Initial early implementation activities centered around the ATMS function. Park-and-Ride lots, High Occupancy Vehicle (HOV) lanes, commuter rail, heavy rail, bus, and connections to airport cruise port, and seaport facilities are all present in the corridor. The overall goal of the project was to provide real-time information to assist I-95 corridor travelers with guidance and mode decisions prior to and during a trip. Phase I of the project (completed in December 1994) provided a design report and a preliminary engineering and operational analysis. Phase II has performed the final design to deploy ITS technologies to provide real-time intermodal information on the I-95 corridor.

INTELLIGENT TRANSPORTATION SYSTEMS - POLICY, OPERATIONS AND SYSTEMS RESEARCH CENTER

Description:

This project provided an evaluation of the SmarTraveler Project and its impact on the Washington Metropolitan area. The project developed a coordinated plan for multi-year research to be conducted by the Urban Transportation Consortium comprised of George Mason University, the University of Virginia and Virginia Polytechnic Institute. This activity established the foundation for a six-year, \$2 million per year Urban Transportation Consortium project funded by U. S. DOT's Research and Special Programs Administration. George Mason University developed corridor-specific planning models for the I-66 and I-81 corridors for the Fairfax Planning Commission and will focus on ITS institutional policy issues. The University of Virginia concentrated on ITS Systems Engineering issues, while Virginia Polytechnic Institute focused on research relating to ITS operations and intelligent infrastructure.

ITS FOR VOLUNTARY EMISSIONS REDUCTION

Description:

An active infrared roadside emissions sensor and a variable message sign at a freeway exit ramp provided real-time vehicle emissions readings to passing motorists. A telephone information hotline, and brochures were made available at area service stations provided motorists additional information on the benefits of keeping their vehicle tuned. The focus of this project was to prompt people to tune their vehicles to reduce emissions. The effectiveness of the test was evaluated through surveys and by measurement of identified high emitters at the site over time. The primary objective of this test was to evaluate the usefulness and public acceptance of providing real-time emissions information to drivers and education material about the fuel savings and air quality benefits of well tuned vehicles.

JOHNSON CITY, TN

Description:

Phase I of the Johnson City Med/Tech Corridor ITS Project used advanced computer and communications technology to more effectively manage parking and travel within a city dominated by an institutional corridor. Phase II of the Johnson City ITS Project expanded upon the parking management technologies tested in Phase I to develop a broadly-deployed ITS system incorporating automated traffic signal control technologies, Advanced Transit Management Systems, and dissemination of transportation information via the Internet. The technologies used for travel management are designed to conform to the national ITS architecture for modular addition of ITS services. Specific objectives achieved in Phase II included: use of GIS to support interactive control of Johnson City MONARC traffic signal control system and to optimize traffic signal timing for real-time response to traffic loads; specify, design, and install Automatic Vehicle Location System, computer-aided dispatch, and automated paratransit scheduling to optimize transit and paratransit operations; develop an Internet site for public access for ATIS and for public participation in the transportation planning process; and promote public awareness and use of ITS products.

MOBILE COMMUNICATIONS SYSTEM

Description:

This project tested and evaluated the use of a portable detection and surveillance system for highway construction, special events, and incident locations. Specially-equipped trailers were placed at temporary traffic congestion locations throughout Orange County. Trailer-mounted video image detectors used spread spectrum radio for transmission of real-time information to a CalTrans control center.

Project Location:

Orange County, California

Partner(s):

California DOT (CalTrans), City of Anaheim, City of Irvine, Hughes Aircraft, CalPoly University, PATH, California Highway Patrol, Orange County Transportation Authority, and the University of California - Irvine's Institute of Transportation Studies

Start Date:

May 1994

End Date:

July 1999

MONTGOMERY ADVANCED TRAFFIC MANAGEMENT SYSTEM

Description:

Development of an Advanced Traffic Management System for the City of Montgomery. It included the installation of 12 miles of fiber optic cable along the southern and eastern by-passes that will inter-connect all traffic signals along that corridor. It also installed cameras at major intersections.

Project Location:

Montgomery, Alabama

Partner(s):

City of Montgomery/Alabama DOT/FHWA

Start Date:

August 1997

End Date:

December 1998

MULTI-JURISDICTIONAL LIVE AERIAL VIDEO SURVEILLANCE SYSTEM, I

Description:

This ITS operational test project provided for the procurement, installation, and evaluation of live video transmission from a gyro-stabilized camera mounted on helicopters for use in observing, evaluating, and properly managing major highway incidents and situations of a public safety nature. The live color video was transmitted to police and state highway traffic management centers, and to mobile command centers at incident sites. Communications technologies included microwave, Community Access TV (CATV), and state-owned coaxial cable. It was found that the use of real-time airborne video serves as a valuable component of an Advanced Traffic Management System (ATMS), particularly in major incident management.

Project Location:

Fairfax County, Virginia

MULTI-JURISDICTIONAL LIVE AERIAL VIDEO SURVEILLANCE SYSTEM, II

Description:

Similar in concept to the completed project in Fairfax County, Virginia, this operational test project evaluated live video transmission from fixed-wing aircraft to county and state traffic management centers. Maryland and Virginia cooperated in this effort and transmitted video to traffic management centers in both states. Maryland, like Virginia, also tested the feasibility of transmitting live video to mobile command centers. The project was recently amended to include establishment of a data and video link between the Montgomery County ATMS and the ITS Room located at US DOT Headquarters in Washington, DC.

Project Location:

Montgomery Country, Maryland

NETWORK-WIDE OPTIMIZATION OF MODELS

Description:

The objective of this contract was to develop a computer package which will allow users to: (1) coordinate the signal timing and ramp metering functions, (2) develop metering rates for metered freeway on-ramps, and (3) optimize signal timing at isolated intersections, on arterials, and in closed networks. In addition, a Windows-based user interface based on a graphical user interface utilizing point-and-click technology was developed for this package.

NEW YORK THRUWAY ELECTRONIC TOLL COLLECTION AND TRAFFIC MANAGEMENT

Description:

As part of the E-Z-PASS Interagency Group (a coalition of seven toll authorities in New York, New Jersey, Delaware, and Pennsylvania), the New York State Thruway Authority (NYSTA) is deploying Electronic Toll Collection and Traffic Management (ETTM) on its facilities. NYSTA's aggressive ETTM program resulted in applying the Automatic Vehicle Identification (AVI) technology to the 63 toll plazas of the Thruway's 641-mile system by the end of 1996. The proposed distributed system accommodates both commercial vehicles and commuter traffic with read-write technology. The NYSTA is also creating a multi-agency automated billing system for seamless customer service on other E-Z PASS systems.

NORFOLK MOBILITY MANAGER

Description:

This project operationally tested and evaluated how transit and paratransit user subsidies can improved transportation services available to low-income transit riders. Subsidies provided directly to low-income people encouraged private operators to provide better transportation services. Part of the project allowed Tidewater Regional Transit (TRT) to act as a mobility manager through its distribution of "Mobility Vouchers" to employers who, first, contribute to the face value of the vouchers and then, gave them to qualified employees as a benefit. Employees used the vouchers to pay for the transit service of their choice. In addition to working through employers, the project included an effort to work with social service agencies, especially in the medical area.

Project Location:

Norfolk, Virginia

Partner(s):

Tidewater Transportation District Commission

Start Date:

April 1989

End Date:

December 1993

NORTHERN VIRGINIA TRAFFIC SIGNAL MANAGEMENT SYSTEM

Description:

This project implemented a computerized traffic signal system in the Virginia DOT Northern Virginia District and initially includes about 800 signals in Fairfax, Prince William, and Loudoun Counties. The system is a computer-based, networked, central system operating on a multi-tasking environment. Communication to the signals is by leased digital telephone lines. The system provides information management, reporting and analysis of data, inventory control, maintenance logging, real-time graphics display, location designs, and cabinet wiring diagrams. The system has the ability to upload and download all timing settings, operations parameters, and status information from the central control room or remote access locations. Five remote access workstations have been provided. The Real-Time Traffic Adaptive Control System was field tested on a 16-signal corridor as part of the project.

Project Location:

Fairfax County, Virginia

Partner(s):

Virginia DOT

Start Date:

July 1993

End Date:

February 1999

**Estimated Total

PORTLAND SMART BUS

Description:

This project reviewed the German-made Flexible Operation Command and Control System (FOCCS) that integrates fixed-route transit, dial-a-ride minibus, and contract taxi services. The information integration provides arrival and destination data to travelers and operators. The review included the following: first, evaluating the technical and economic feasibility of adding audiotex/videotex components and carpool matching capabilities to the systems; second, evaluating the technical requirements of adding a FOCCS components to Tri-Met's central control plans; third, evaluating the cost-effectiveness of FOCCS in Portland's rapidly growing suburbs; and fourth, designing an operational test for those components found suitable. Hardware and software requirements are included in the analysis.

Project Location:

Portland, Oregon

Contractor(s):

Tri-Met of Portland, Oregon

Start Date:

September 1990

End Date:

September 1993

REAL-TIME TRAFFIC ADAPTIVE SIGNAL CONTROL FOR ITS

Description:

This study, to develop a prototype real-time, traffic adaptive signal control system suitable for use in an ITS environment by 1997, was the first of three studies which eventually developed five prototypes for laboratory evaluation, from which one was selected for further development and field evaluation by 1997. This study encompassed the first stage of a long term effort. A single, major contract was awarded to a consortium composed of State and local DOT's, private industry, and academia.

Project Location:

Rockville, Maryland

SACRAMENTO RIDESHARE

Description:

The Sacramento Real-Time Ridesharing project used a geographic information system (GIS) to provide single-trip or multiple-trip real-time ridesharing information. A driver seeking a rider entered the request into the system through one of the transportation management associations (TMAs). A prospective rider entered a destination and ride request. Driver incentives were also identified in the implementation of the system.

SALT LAKE CITY INTERIM TRAFFIC OPERATIONS CENTER

Description:

This project consisted of the development of an interim Traffic Operations Center (TOC) located at the site where the planned Salt Lake City Traffic Control Center will ultimately be located. The interim TOC supported the operation of the Utah DOT, Salt Lake County and Salt Lake City signal systems and the freeway management system to facilitate travel during the reconstruction of I-15 in the Salt Lake City area. The I-15 reconstruction project included installation of the ultimate Utah DOT freeway management system for the area.

Project Location:

Salt Lake City, Utah

Partner(s):

Utah DOT, Salt Lake City, Salt Lake County

Start Date:

October 1997

SAN ANTONIO TRANSGUIDE

Description:

The Texas DOT installed a state-of-the-technology advanced traffic management system (TransGuide) in San Antonio. The Phase 1 project resulted in a three story control center and twenty-five miles of the one hundred ninety mile proposed ATMS. TransGuide provides:

- * Complete digital communication network (voice, data, and video);
- * Communication standard "SONET";
- * Fully redundant fiber optic network;
- * Fault tolerant computer system;
- * Software developed to "POSIX" standards;
- * Fully developed Central Control facility with a test-bed development computer;
- * Field equipment consisting of changeable message signs, lane control signals, loop detectors, and surveillance cameras;
- * Incident detection goal of 2 minutes; and
- * System response goal of under 1 minute after detection.

This Operational Test documented the San Antonio TransGuide system design rationale and goals, evaluate the system's success in meeting the design goals, and evaluate the digital communication network for cost effectiveness and benefits versus "traditional" transportation data communication systems. An additional element of this Operational Test is the on-line evaluation and comparison of several incident detection algorithms.

A \$150,000 Before-and-After study for Phase 2 on Loop 410 was added to the project in 1996, extending the completion date for a year.

Project Location:

San Antonio, Texas

Partner(s):

Texas DOT, AlliedSignal Technical Services Corporation, Southwest Research Institute (SWRI), and Texas Transportation Institute (TTI)

SANTA CLARA COUNTY SMART VEHICLE

Description:

This project used global positioning system (GPS) technology for automatic vehicle location (AVL) operation of a paratransit system in conjunction with bus, light rail, and train operation. The service provided allows disabled travelers to request specific transportation service. A vehicle was routed and, where appropriate, the traveler was transferred to a fixed-route mode. Use is made of AVL technology, demand-responsive dispatching software, and a navigable map database which allows the closest available vehicle nearest a requester to be dispatched.

Project Location:

Santa Clara County, California

Partner(s):

Division of New Technology and Research of the California DOT (Caltrans), Santa Clara County Transportation Authority, Outreach Paratransit Broker, Trimble Navigation, UMA Engineering, Navigation Technologies, and Volpe National Transportation Systems Center

Start Date:

SATELLITE COMMUNICATIONS FEASIBILITY

Description:

This project evaluated the use of Very Small Aperture Terminal (VSAT) satellite as the communications medium for four stationary closed-circuit television (CCTV) cameras and a mobile CCTV camera and communication platform. Specific objectives of the project are to: (1) develop and evaluate the feasibility of remote switching of multiple cameras through a single satellite channel, (2) develop and evaluate the feasibility of a mobile CCTV camera and communication platform, (3) determine the impact of weather conditions and other factors that degrade the VSAT signal integrity, (4) determine the limitation of VSAT for video surveillance by examining image clarity, pan-tilt-zoom controls and other factors associated with day-to-day CCTV freeway surveillance, (5) test the security of VSAT remote equipment with respect to vandalism and theft, and (6) compare VSAT video quality with other communications medium including leased T-1 service and direct fiber optic cable.

SCOOT ADAPTIVE TRAFFIC CONTROL SYSTEM

Description:

This operational test implemented SCOOT in an area of the City of Anaheim's traffic signal system so that it could be evaluated for its effectiveness as an adaptive signal timing control package. SCOOT automates the data collection process and then automatically optimizes traffic signal timing based on real-time traffic conditions. The test also included the installation and evaluation of Video Traffic Detection System (VTDS) cameras in conjunction with the SCOOT system. The VTDS cameras potentially provide a way to adjust the traffic count locations so that optimal data collection sites for the SCOOT system can be identified.

Project Location:

Anaheim, California

Partner(s):

City of Anaheim, California DOT (CalTrans), Odetics, PATH, CalPoly University, and University of Southern California

SEATTLE SMART TRAVELER

Description:

This project examined ways in which mobile communications, such as cellular phones, and information kiosks could be used to make ridesharing (carpooling and vanpooling) more attractive, and evaluated a Traveler Information System. A set of information-based services for ridematching was developed in Phase I in cooperation with the mobile telecommunications industry in an effort to increase the use of HOV facilities. The initial focus advised private auto drivers of rideshare possibilities using mobile communications. A second phase operationally tested a prototype computer-based, interactive commuter information center in an office building in downtown Bellevue. The center provided computerized transit information, rideshare matching, and a method to schedule occasional carpool or vanpool trips. In addition to cellular telephone, the technological applications included voice mail, computer-based ridematching, traffic monitoring computers, and electronic maps.

TRAFFIC RESEARCH LABORATORY (TREL)

Description:

The TReL is an ATMS testbed which integrates research and development tools into a seamless analysis environment. This project used the TreL testbed to address crucial issues in ATMS such as: the impact of incident detection upon level of service, the effects of dynamic traffic assignment, and system integration issues to help guide ATMS deployment. The Phase I testbed was completed in 1995. It provided the research and analysis capabilities needed to help quantify the benefits of ITS deployment and answer initial critical issues. The Phase II testbed provides real-time and faster than real-time simulation capabilities to support emulation of an actual advanced traffic management control center. The Phase II testbed answers questions such as how to design and implement the functionality of the ATMS control center.

TRAFFIC SURVEILLANCE AND DETECTION TECHNOLOGY DEVELOPMENT

Description:

This funding was used to identify and develop new detection technologies and surveillance concepts. With the rapid advances in industry technology, new options for detection need to be made available for use by traffic management centers. As ITS-class Dynamic Traffic Assignment, Real-Time Traffic-Adaptive Control, and Incident Detection systems are developed, new measures of effectiveness (such as queue lengths) may be required inputs to these modules. This study identified potential means of obtaining this data directly from the field using new surveillance and detection capabilities that are more accurate and cost-effective than those which are currently available. This project was conducted in two phases. The first phase was an effort to adapt various sensor technologies for use in transportation detection applications. The second phase was an effort to conduct testing to determine the relationships between the data the sensor can provide and the performance of ATMS functions alone and integrated. In order to identify performance relationships between function/sensor combinations, part of phase two investigated the integration of data from these advance sensors with various ATMS functions.

TRANSLINK RESEARCH AND DEVELOPMENT PROGRAM

Description:

This project, conducted under the auspices of ITS Research Centers of Excellence program, was designed to facilitate the integration of "real-time" ITS system monitoring capabilities into existing and future transportation management systems. Areas of emphasis for TRANSLINK research included linkages between ITS subsystems such as advanced traffic management systems and transit management systems. There was specific focus on railroad integration with ATMS and ATIS systems and police vehicle subsystem integration with enforcement/response center systems. There was also research emphasis on transportation center automation and support of TRASIM.

TRANSMIT

Description:

The "TRANSMIT" (TRANSCOM's System for Managing Incidents and Traffic) Operational Test evaluated the use of automatic vehicle identification (AVI) technology as an incident detection tool. The system of AVI "tag" readers allows vehicles equipped with transponders to serve as traffic probes. Tag-equipped probe vehicles are assigned a random identification number as they enter a system populated with AVI readers spaced approximately 2 kilometers apart. Software analysis is used to help identify potential incidents by comparing actual to predicted travel times between readers, in addition to determining real-time traffic information such as speed and travel time.

Project Location:

Rockland County, New Jersey/Bergen County, New Jersey

Partner(s):

New Jersey DOT, New York State Thruway Authority, New Jersey Highway Authority, TRANSCOM

TRAVLINK

Description:

TravLink implemented an Advanced Traveler Information System and Advanced Public Transportation System along the I-394 corridor extending from downtown Minneapolis, approximately 12 miles to the west. TravLink is a part of the Minnesota Guidestar ITS program and provided real-time transit schedule and traffic information through a combination of kiosks and terminals at work, home, shopping centers, and transit stations.

Project Location:

Minneapolis, Minnesota

Partner(s):

Minnesota DOT, St. Paul Metropolitan Council Operations, US West, 3M-Renix, City of Minneapolis, University of Minnesota

Start Date:

September 1992

End Date:

October 1996

**Estimated Total

TRAVTEK

Description:

TravTek (Travel Technology) provided traffic congestion information, motorist services ("yellow pages") information, tourist information and route guidance to operators of 100 test vehicles, rented through AVIS, that were equipped with in-vehicle TravTek devices. Route guidance reflected real time traffic conditions in the TravTek traffic network. A Traffic Management Center obtained traffic congestion information from various sources and provided this integrated information, via digital data radio broadcasts, to the test vehicles and the data sources. TravTek rental operations began in March 1992. The operations phase ended in March 1993. The data collection for project evaluation is completed. Eight final evaluation reports were made available in late 1995. A video has been developed to disseminate information on the TravTek evaluation project. The video serves as an executive summary for the project, providing information on the overall project goals and objectives, the public/private partnership created to carry out the effort, the system design approach, the key evaluation questions, and finally a summary of the results from the evaluation activities. The video was developed for FHWA by SAIC in consultation with the TravTek partners. In addition to the TravTek partners, the National Highway Traffic Safety Administration participated in the TravTek evaluation. All reports have been completed.

TRILOGY

Description:

The Trilogy project is part of the Minnesota statewide ITS program, Guidestar. Trilogy provides traveler information through different communications techniques: the Radio Broadcast Data System-Traffic Message Channel (RBDS-TMC), and a high-speed FM subcarrier. The primary objective of Trilogy was to test and compare a range of user devices and evaluate the potential improvement in efficiency of the existing transportation network. These devices provide end users with area and route-specific en-route advisories on the highway operating conditions in the Twin Cities Metropolitan Area.

Project Location:

Twin Cities Metropolitan Area

Partner(s):

Minnesota DOT, AB Volvo, DCI, Sieko Communications Systems, and Indikta Displays

Start Date:

July 1994

End Date:

May 1999

**Estimated Total
ITS Funds:**

\$2,776,000

**Estimated Total
Project Cost:**

\$4,080,000

WASHINGTON, D.C. ADVANCED FARE MEDIA

Description:

The purpose of this project was to develop and demonstrate an advanced Integrated Fare Collection System that would employ advanced technologies, improve security, and allow the sale and use of long term transit pass while assuring reliability and security against fraudulent abuse. Washington Metro Area Transit Authority (WMATA) selected Cubic's Go-Card System, a proximity reader/encoder that activates the fare gates when the passenger holds the pass within inches of the reader. The fare media also accommodated debiting the card on exiting the system and having the capability to integrate the fare collection system throughout the Authority by allowing passengers to use the same fare media to pay for Metrorail, Metrobus, and parking. The new system was installed in both directions of at least two aisles on as many as possible of the 93 mezzanines at the 70 stations. The system worked in conjunction with, or in addition to, the equipment currently being used and did not reduce the capabilities of the existing equipment.

Fare collection equipment has been installed at 29 Metro stations, on 21 buses and at 5 parking lots. The system was installed and put into operation February 6, 1995, for a one year demonstration period.

Project Location:

Washington, DC metropolitan area

Partner(s):

WMATA and Cubic

Start Date:

December 1994

WINSTON-SALEM MOBILITY MANAGEMENT

Description:

This project defined and identified system needs and operationally tested and evaluated a mobility management system for the City of Winston-Salem. It included automated scheduling and demand-responsive, shared-ride transit for the young, elderly, and disabled who are unable to use fixed-route transit (Phase I). The project extended the transportation service to fixed-route transit, ridesharing and taxis used by the general public (Phase II). Integration with the Winston-Salem traffic management program was accomplished. Technologies being investigated also include smart cards, GPS, and automatic vehicle location.

Project Location:

Winston-Salem, North Carolina

Partner(s):

Winston-Salem Transit Authority (WSTA), City of Winston-Salem, North Carolina DOT, and North Carolina State University's Institute for Transportation Research and Education

III. INTELLIGENT RURAL INFRASTRUCTURE

III. INTELLIGENT RURAL INFRASTRUCTURE

The rural areas of the United States account for a small and dispersed portion of our nation's population, yet they encompass a significant portion of the transportation system. Rural areas account for 80% of the total U.S. road mileage and 40% of the vehicle miles traveled, and there is a unique set of characteristics associated with this system. Consequently, rural travelers have ITS needs similar to those experienced by their urban counterparts, though the priority of these needs differs. These differences reflect the rural environment characterized by long distances, relatively low traffic volumes, relatively rare traffic congestion, travelers unfamiliar with their surroundings, and rugged terrain in remote areas. Furthermore, rural characteristics soliciting ITS solutions include an over representation of fatal crashes (about 60% of traffic fatalities and 55% of work zone fatalities occur in rural areas), safety problems related to high speeds on non-interstate rural roads and increased response time for Emergency Medical Services.

Early ITS efforts were driven by the desire to address growing transportation problems in urban areas and in interurban corridors. While many of the technologies and systems aimed at solving these problems also have application outside urban settings, the market structure, application logistics, and motivating factors underlying their deployment vary considerably from urban to rural areas. U.S. DOT's vision for Advanced Rural Transportation Systems (ARTS) is described in the National Intelligent Transportation Systems Five-Year Program Plan. This plan addresses the research and testing initiatives to foster implementation of intelligent rural infrastructure. While information technologies are currently being applied in rural settings to help improve the safety and mobility of rural travelers, rural ITS applications are not yet as well defined as metropolitan and commercial vehicle applications. Under TEA-21, the rural program will focus primarily on research and field operational testing to further development of rural infrastructure components.

Achieving the strategic objectives of the Federal ARTS program means recognizing the extremely diverse nature of the rural transportation system. Diversity is exhibited in the system's wide-range of motorists, managers, maintenance staff, operators, road types, terrain, climates, jurisdictions, land use, and seasonal characteristics. These diverse characteristics translate into a wide variety of needs, problems, and opportunities for improvement. Consequently, the ARTS solutions, i.e., the application of advanced technologies to meet these disparate needs, problems and opportunities, must be diverse as well. The strategies to identify these solutions must also recognize this diversity.

In 1995, a strategic plan was developed that defined seven critical program areas for the rural ITS program. Since then, the rural program has evolved to be structured in terms of development tracks as a way to organize research, development, and testing activities as reflected in the Five-Year Program Plan. U.S. DOT expects to refine these concepts until rural ITS infrastructure is more fully defined, is more widely deployed, and can ultimately be tracked. The technical development tracks cover the diversity of the rural transportation system and the breadth of the rural ITS program. They are:

- Surface Transportation Weather and Winter Mobility - Consists of technologies which alert drivers to hazardous conditions and dangers, and include wide-area information dissemination of site-specific safety advisories and warnings.

- Emergency Services - Systems which improve emergency response to serious crashes in rural areas including technologies that automatically mobilize the closest police, ambulances, or fire fighters in cases of collisions or other emergencies, even in the most remote locations.
- Statewide/Regional Traveler Information Infrastructure - These provide information to travelers who are unfamiliar with the local rural area. This infrastructure supports services which can be provided at specific locations, en route, or well in advance of the traveler's destination.
- Rural Crash Prevention - Focuses on the prevention of crashes before they occur, as well as on reducing crash severity. Rural areas are recognized for their unique environments and frequently for rugged terrain. They present additional hazards for drivers such as flawed road geometry/structure, hazards leading to road departure, adverse weather and unexpected encounters such as rock falls and animals. Through examination of rural travelers' needs, crash prevention measures and advanced technologies will be identified for implementation.
- Rural Transit Mobility - These services strive to improve the efficiency of rural transit services and their accessibility to rural residents. Advanced vehicle locating devices and communications systems can help achieve better scheduling, improved dispatching, smart card payment transactions, and advanced ridesharing and ride-matching systems. These systems also improve the efficiency of other rural fleets, such as snowplows and even law enforcement vehicles, through advanced vehicle tracking and on-board equipment monitoring systems.
- Rural Traffic Management - Strives to identify and implement multi-jurisdictional coordination, mobile facilities and simple solutions for small communities and operation in areas where utilities may not be available. Emphasis on research will be placed on systems to perform surveillance, control and communication to meet rural needs.
- Highway Operations and Maintenance - Leverage technologies that improve the ability of our highway workers to maintain and operate rural roads. These include severe weather information systems, early detection of pavement and bridge failures, and immediate detection of dangers to work zone crews.

The above division is the primary dimension for these development tracks and focuses on identifiable needs categories. Statewide/Regional Traveler Information Infrastructure for example refers to the infrastructure and systems support that a visitor (both driver and passenger) unfamiliar with a rural area may require as well as the Visitors and Tourism Bureaus, transit service providers, information providers, etc., that provide the services to meet their needs. In a tourist resort area, this may be the main focus of the ITS program. In other areas it may exist but play a smaller role. Likewise, the Rural Transit Mobility Service focuses on reducing the isolation of the transportation disadvantaged and increasing the mobility of all. Its constituents also include both the potential travelers and service providers. Because of the costs of the provision of services in rural areas, the operations and maintenance activities may also form their own divisions. As ITS services are shown to reduce the cost of these services and improve their efficiency, these areas and the

organizations responsible for providing them become natural constituents and advocates for the programs.

ITS applications such as incident notification (cellular and Mayday), advanced hazard warning systems, advanced traveler information services, and in-vehicle crash avoidance systems, are some of the ITS applications which can address the issues affecting rural transportation and significantly impact the safety and mobility of rural travelers. Other ITS R&D programs within NHTSA and FHWA have substantial rural components--that is, they examine crash avoidance/warning, traveler information, vehicle control, automated roadway, or other safety technologies that have primary applications in improving rural safety.

An additional innovation was the documenting of successful rural ITS applications to serve as a resource for decision makers planning future rural deployments. This effort includes an “on-line” ARTS Compendium of some 200 ITS-related projects in rural settings and a publication on low cost, low technology ITS success stories for rural areas titled *Technology in Rural Transportation: Simple Solutions*.

The operational tests described in this section reflect recent initiatives in rural public transportation, integrated weather information and rural travel and tourism. These projects highlight the unique and varied challenges faced by the rural travel environment. A clear example of the need to adapt the deployment of technologies to this environment is exemplified in ITS emergency services. This is a critical application in rural areas where response times are normally greater than in metropolitan areas. This is one of several technology applications requiring further testing and evaluation. Others focused on cellular telephone coverage and road weather information systems are more mature, and better prepared for deployment.

U.S. DOT is advocating a three-step approach to the rural ITS program. The initial step – **development** – encompasses research, operational tests and examination of system integration issues, especially those associated with standards and application of the National ITS Architecture. The second step – **facilitating deployment** – seeks to stimulate a disciplined and incremental approach which encourages rural jurisdictions to define the technologies they want to integrate into their systems, and then gradually build toward the ultimate system in modest subsystem incremental deployments. The final program step – **delivery** – strives toward successful outreach, fostering technical development and professional capacity building.

Surface Transportation Weather and Winter Mobility

ADVANCED TRANSPORTATION WEATHER INFORMATION SYSTEM

Description:

This project is to provide an evaluation and demonstration of how current technologies in mesoscale meteorological analysis and forecasting can be effectively used to produce precise spatial and temporal weather information for integration into an Advanced Transportation Information System for safer and more efficient operations. Through this evaluation and demonstration, a prototype information and management center to support traffic weather analysis and forecasting in a responsive decision support environment will be developed. This system will be capable of providing immediate assessment of difficulties in travel arising from changing weather conditions. This project will demonstrate a prototypical advanced weather information system which may be implemented on a larger national scale.

FORETELL - INTEGRATING ITS WITH ADVANCED WEATHER PREDICTION

Description:

The project objectives are twofold: (1) to develop an integrated weather information system that improves and broadens the scope of atmospheric and road surface condition information available to highway users and operators; and (2) to assess the benefits of integrating the functions of Road Weather Information Systems, other weather information sources, and transportation management and traveler information operations for a rural section of the transportation system.

IDAHO STORM WARNING SYSTEM

Description:

The purpose of the Idaho Storm Warning Operational Test is to investigate various sensor systems that could provide accurate and reliable visibility and weather data, and to use that data to provide general warnings, speed advisories, and possible road closure information to travelers on a section of I-84 in southeast Idaho that is highly prone to reduced visibility from blowing snow and dust. The primary goal of such a system is a major reduction in visibility-related multi-vehicle accidents in rural areas. Information will be transmitted to the motorist via changeable message signs.

Project Location:

Interstate 84 in southeastern Idaho.

SPOKANE, WASHINGTON STATE ROUTE 395 TRAVELER INFORMATION PROJECT

Description:

The objective of this project is to install a roadway information system that will communicate to the public and road maintenance crews information concerning current weather conditions, road surface conditions, border crossings, flooding, slides and any other items necessary to assist roadway users in making informed travel decisions. The system will include ITS technology and be integrated into a regional ITS system. The project plan approach will include: installing video cameras at locations on SR 395, SR 20, SR 21 and SR 25; installing Roadway Weather Information System at key locations on SR 395 or its associated highways; installing highway advisory radios at key locations to provide information to travelers en-route to their destinations; and providing traveler information data and images to the public via an internet web page. Roadway Weather Information Systems will be integrated with traveler information and infrastructure operation and maintenance.

Statewide/Regional Traveler Information Infrastructure

DEVELOPMENT OF RURAL ITS

Description:

The main objectives of this FHWA-sponsored effort specifically include:

- * Assisting the U.S. DOT Rural Team in ARTS program management, procurement, development, coordination, and promotion;
- * Conducting the comprehensive system engineering efforts necessary for integration of Rural ITS requirements into the National ITS program;
- * Conducting specific studies, providing technical assistance, and participating in other activities to define and better understand the technical, institutional, and implementation issues surrounding the development and deployment of Rural ITS; and
- * Developing products that document the system design and other Rural ITS findings in a variety of formats that aid in the implementation of this system design by federal, state, and local governments, private industry, and other constituents.

These objectives will be met through a set of task orders; each task order will be issued as needed.

RURAL APPLICATIONS OF ADVANCED TRAVELER INFORMATION SYSTEMS

Description:

This study will examine Advanced Traveler Information Systems (ATIS) for rural applications. The research will examine a broad range of rural environments, categories of travelers, ATIS applications, and advanced electronic and communication technologies. The study involves determining the needs for ATIS services in rural and small urban areas and developing the functional requirements for providing them. The feasibility and cost-effectiveness of alternative applications and Advanced Traveler Information Systems related technologies will be assessed. Based upon these analyses, priorities and plans for subsequent prototyping and operational field testing were developed. The most promising rural ATIS applications will be developed and tested in a limited rural environment; including an evaluation of satellite communications for Mayday and a Surveillance and Delay Advisory System. A similar process to assess rural transit user and operator needs and system concept development was conducted. Several reports have been published.

Focus group discussions and telephone survey of rural travel needs and concerns have been completed. Some 20 preliminary concepts developed to meet rural travel needs were evaluated in terms of potential cost, benefits, implementation issues and trade-offs. A rural Action Plan was developed. Mayday satellite communications study, and preliminary testing of a Surveillance and Delay Advisory System (SDAS) have been completed. Further SDAS testing was completed in the summer of 1998. Test results are being evaluated.

ADVANCED RURAL TRANSPORTATION INFORMATION AND COORDINATION

Description:

The Advanced Rural Transportation Information and Coordination (ARTIC) project is part of the Minnesota Statewide ITS program, Guidestar. ARTIC coordinates the communications systems of several public agencies (highway, state patrol, and transit) by establishing a centralized communication site. Improvements are expected in response time to accident and road condition emergencies, and real-time vehicle status and schedule information will be provided through ARTIC. The primary objective of ARTIC is to evaluate the improvement in the transportation system and traveler safety by establishing a centralized communication site.

BRANSON, MISSOURI TRIP (TRAVEL AND RECREATIONAL INFORMATION PROJECT)

Description:

Branson, a rural community located in the heart of the Ozark Mountains, has become known as the live entertainment capital of the world. The pristine natural surroundings of Branson have always attracted large numbers of visitors. The Branson TRIP seeks to provide Branson Tri-Lakes area tourists with comprehensive tourist attractions, weather, traffic and road construction information. This information will be provided through technologies such as the World Wide Web, dial-in telephone services, changeable message signs, highway advisory radio, commercial radio, kiosks, and cable television. The project will evaluate those means of conveying information.

Project Location:

GREATER YELLOWSTONE RURAL ITS PROJECT

Description:

One of the key products to be developed as a part of this project is a Strategic Deployment Plan for the Greater Yellowstone Rural ITS Project. This effort will address the feasibility, demonstrate and evaluate how current ITS technologies may be applied as a viable solution to addressing travel and safety issues in a rural transportation environment. The specific setting of the project encompasses the three major transportation corridors in the surrounding states of Idaho, Wyoming and Montana which travelers use to access the National Park.

The Greater Yellowstone Rural ITS Project will also serve as a testbed for rural ITS applications to facilitate moving the state-of-the art in Advanced Rural Transportation Systems forward. This project will support a limited amount of deployment and testing of the short term projects identified as priorities in the Strategic Deployment Plan. The ability to provide information to travelers has been identified as one of the key needs to be addressed in the initial study. The initial goals identified for the study include increasing safety, improving emergency response, improving commercial vehicle operations, increasing travel information and trip enhancement, improving interagency communications, reduce congestion and increase economic activity.

Early winner projects identified in the Strategic Deployment Plan are under development. Early winner projects include an AVI system test for two entrances into the Yellowstone National Park. Other projects include interactive kiosks at locations within the National Parks, Cellular Incident Hotline Reporting, signing, dynamic warning signs, and an incident management plan for roadway closures.

Project Location:

Idaho and Montana; US 191/20 from Bozeman, MT to Idaho Falls, ID; I-15 from Butte, MT to Idaho Falls, ID (including I-90 from Bozeman to Butte); US 89/26 from Livingston, MT to Idaho Falls, ID (including I-90 from Bozeman MT to Livingston MT).

Partner(s):

Idaho DOT, Western Transportation Institute, Montana DOT, Wyoming DOT, National Park Service, Idaho National Engineering Laboratory, Idaho State Police, Travel Montana, Gallatin (MT) County

Start Date:

June 1997

End Date:

July 2000

Estimated Total ITS Funds:

\$1,500,000

Estimated Total Project Cost:

\$1,850,000

HERALD EN-ROUTE DRIVER ADVISORY SYSTEM VIA AM SUBCARRIER

Description:

The main concept of this project is to disseminate traveler information in difficult-to-reach, remote rural areas using a subcarrier on an AM broadcast station. The three basic components of Herald -- message generation, message transmission and message reception -- have been developed under an effort by the multi-state organization called ENTERPRISE. This project will determine the performance of the system and analyze the impacts on broadcasters, travelers and equipment manufacturers. The primary objective of this test will be to assess real world impacts of the system related to transmission of traveler information in challenging terrain (Colorado), potentially interfering environmental conditions (Iowa), improvements to safety, and the overall marketability of the system.

Project Location:

Colorado and Iowa

Partner(s):

Modulation Sciences and members of the ENTERPRISE group (Departments of Transportation from the States of Arizona, Colorado, Iowa, Michigan, Minnesota, North Carolina and Washington State, and the Dutch Ministry of Transport, Ministry of Transportation of Ontario, and Transport Canada)

Start Date:

January 1995

End Date:

April 2000

Estimated Total ITS Funds:

\$200,000

Estimated Total Project Cost:

\$380,000

Contacts:

Scott Sands	FHWA Colorado Division, HFO-CO	(303) 969-6730	Ext. 362
John Whited	Iowa DOT	(515) 239-1411	

BRANDON, VERMONT

Description:

Brandon is located in western Vermont along the US Route 7 corridor. Route 7 is part of the National Highway System (NHS) and is the main north-south travel corridor in western Vermont, connecting western Massachusetts to the south with Quebec to the north. It passes through Bennington, Rutland, and Middlebury, three of the largest communities in the state, as well as the Burlington metropolitan area, which is the major population center.

This corridor has significant amounts of truck traffic, as it is the principal connection for freight transportation between the major communities and the Albany, New York, area. In many areas, limited passing opportunities create long queues of vehicles behind slow-moving trucks. Since the right-of-way for Route 7 dates back to the very earliest days of county road building in the state, it passes directly through most of the town and village centers along the corridor, including Brandon. This condition is aggravated by heavy truck traffic through town transporting ore from a quarry to a processing plant on northern and southern sides of town. This project will pursue the following initiatives designed to address Brandon's problems:

--Brandon Route 7 WIM site. Adding a WIM site to the state WIM system will allow Vermont to gather considerable data regarding traffic flows, types, and weights. This in turn will help in further defining the existing problem and developing appropriate ITS solutions.

-- Regional ATIS. The Rutland Regional Commission will implement a simple web page with traveler information for the region which includes Brandon. This web site will enhance intermodal connectivity by providing information regarding schedules and availability of air, rail, and transit services, as well as roadway construction. The Rutland area is served by scheduled air service, Amtrak, and several local transit operators, but there is no central source for information regarding the different modes.

Project Location:

Brandon, Vermont

Partner(s):

Vermont Agency of Transportation; Brandon, VT Selectboard; Rutland Regional Planning Commission; Vermont Division of Travel and Tourism

Start Date:

September 1999

End Date:

November 2000

Estimated Total ITS Funds:

\$296,801

Estimated Total Project Cost:

\$593,602

Contacts:

Larry Dwyer	FHWA Vermont Division, HTD-VT	(802) 828-4423
Bruce Bender	Vermont Agency of Transportation	(802) 828-3984

CUMBERLAND GAP TUNNEL AND REGIONAL DEPLOYMENT (MIDDLESBORO, KENTUCKY)

Description:

The ITS project for the Cumberland Gap Tunnel and surrounding regional area will deploy and integrate additional ITS technologies and systems to enhance the safety, mobility, and operations of the regional transportation system. The Cumberland Gap Tunnel is a critical link along the US 25E corridor which intersects with I-75 near Corbin, Kentucky and I-81 near Morristown, Tennessee. It has already benefited from several ITS applications begun in 1998. The 1998 deployment project began installation of an Advanced Traveler Information System to reroute traffic, especially truck traffic, around the Cumberland Gap tunnel during events denying tunnel access. The tunnel is located in a remote, mountainous part of the state accessible only by a single highway with no parallel routes.

A long-term goal for the regional area will be to develop an infrastructure which has the capability to accommodate both temporary and permanent traffic management and traveler information systems.

Among the ITS applications proposed for the corridor are closed circuit television cameras, variable message signs, highway advisory radio, and road weather information systems. The project will provide an appropriate level of integration of system components to ensure operational efficiency and effectiveness.

Federal funding listed below includes 1998 funding and FY 99 earmarked funds. Total funding also includes matching funds allocated in both years.

Project Location:

Middlesboro, Kentucky

Partner(s):

Kentucky Transportation Cabinet, Tennessee DOT, National Park Service, Kentucky Tourism Cabinet, Tennessee Tourism Department, Tunnel Management Inc.

Start Date:

September 1998

End Date:

June 2001

I-90/I-94 RURAL WISCONSIN ITS CORRIDOR

Description:

The Wisconsin Department of Transportation (WisDOT) developed a strategic deployment plan for the Interstate 90/94 corridor in order to implement Intelligent Transportation Systems (ITS) technologies to improve the mobility, efficiency, productivity, and safety of travelers within the corridor. The corridor plan focuses on using ITS technologies in a rural environment and addresses unique rural problems and needs. This funding will enable ITS technology deployment and planning for the "West Salem" Weigh-in-Motion Scale, Automated Oversize/Overweight Routing, Variable Message Sign/Changeable Message Sign Operational Testing, and Incident Management.

Project Location:

Interstate 90/94 Corridor, Wisconsin

Partner(s):

Wisconsin Department of Transportation

Start Date:

October 1998

End Date:

October 2000

**Estimated Total
ITS Funds:**

\$2,125,000

**Estimated Total
Project Cost:**

\$2,125,000

MONROE COUNTY, NEW YORK INTEGRATION PROJECT

Description:

This project will develop and construct the Airport/Transportation Operations Center (ATOC) in support of objectives identified in the regional strategic plan, known as the Improved Mobility Areawide Guidance Evaluation (IMAGE). Freeway traffic management, traffic signal control, and enforcement activities will be housed and integrated within the new center. Additional integration will be accommodated as determined through the updating of the existing regional ITS architecture.

Project Location:

Monroe County, New York

Partner(s):

Monroe County Department of Transportation; Monroe County Department of Public Safety; New York State Police; Rochester-Genesee Regional Transportation Authority; New York State Department of Transportation

Start Date:

September 1999

End Date:

May 2001

**Estimated Total
ITS Funds:**

\$316,587

**Estimated Total
Project Cost:**

\$8,400,000

PORT ANGELES, WASHINGTON

Description:

This project will install a comprehensive traveler information system along the Washington State Route 101 corridor on the northern Olympic Peninsula. The system will be comprised of several technology components, each of which has been proved in other locations in the State. The overall value of the project will be realized through integration of these components into a sum providing more value than the sum of its parts. This project will become a natural extension of the Smart Trek traveler information effort underway in the greater Seattle and Tacoma areas. Key components include video imagery, vehicle detection subsystems, and a roadway weather information system.

Project Location:

Port Angeles, Washington

Partner(s):

Washington State DOT, City of Port Angeles, North Olympic Peninsula Visitors and Convention Bureau, Olympic National Park, Greater Victoria Visitors and Convention Bureau

Start Date:

September 1999

End Date:

November 2001

STATE OF IDAHO ITS INTEGRATION

Description:

This project seeks to implement Stage 2 of a Regional (Treasure Valley) ITS Plan with the following objectives:

- Development of a design for a real-time data collection, integration, and communications system that includes sensors strategically placed on the Treasure Valley freeway and arterial systems.
- Development of a decision support system and database that integrates real-time traffic data.
- Development of a virtual traffic management center to be used to monitor traffic flow in Treasure Valley and that can be used to train new engineers and technicians who will operate 21st century transportation systems.

Project Location:

Treasure Valley, Idaho

Partner(s):

Idaho DOT, Ada County Highway District, Ada Planning Association, University of Idaho, Boise State University

Start Date:

September 1999

End Date:

December 2001

**Estimated Total
ITS Funds:**

\$441,000

**Estimated Total
Project Cost:**

\$837,204

STATE OF WASHINGTON ITS DEPLOYMENT AND INTEGRATION

Description:

The Washington State FY 99 ITS Integration effort is comprised of three projects: Ferry Terminal Traveler Information Improvements; State Routes 2 & 97 Traveler Information Project; and I-5 Corridor Multi-modal Traveler Information System Design and Implementation, described separately below.

- Ferry Terminal Traveler Information Improvements (ITS Funding-\$448K). Washington State Ferries (WSF), as part of the Washington State Department of Transportation (WSDOT), operates the largest ferry system within the United States. The ferry system serves 10 routes within Puget Sound, which connect the Olympic Peninsula to the I-5 corridor as well as providing vital links to the San Juan and many other islands within the Puget Sound. Washington State Ferries is committed to providing transportation to the residents of Washington State. The objective of this project is to install technology applications that will help provide comprehensive traveler information systems that will better inform ferry system users about delays and congestion on ferry routes. This project is also a natural extension to the Smart Trek/traveler information efforts underway in the greater Seattle and Everett areas which provides traveler information about the highway system which serves the ferry routes. Infrastructure to be installed includes: CCTV; vehicle detectors; traveler information dissemination via web page; highway advisory radio and Variable Message Signs (VMS) controlled from WSDOT's Seattle Travel Management Center (TMC). Total Cost-\$896K

- The State Routes 2 & 97 Traveler Information Project (ITS Funding-\$275K). Seeks to enhance the traveler information system along State Routes 2 & 97 in Chelan County. To be accomplished by installation of a roadway information system to communicate weather, road surface condition and road closure information to the public and maintenance crews. Components to be deployed include: Cameras; Roadway Weather Information System (RWIS); web page linked to WSDOT home page; completion of a communication and power link from Stevens Pass to Blewett Pass. Total Cost-\$555K

- I-5 Corridor Multi-modal Traveler Information System Design and Pilot Implementation (ITS Funding-\$250K). Design of a multi-modal traveler information system for inter-city travel between Vancouver, WA, and Bellingham along the I-5 corridor. The project will design a multi-modal traveler information system for inter-city travel within the I-5 corridor between Vancouver, WA, and Bellingham, and implement components of that system in at least one multi-modal transportation facility within the corridor. This pilot implementation will be designed to be transferable to other multi-modal facilities along the corridor. The system will be designed to accommodate a wide variety of information dissemination methods and devices that may be deployed by both the public and private sector. This project will support past and current local, state, interstate, and federal efforts to develop institutional partnerships and improved traveler information services. Total Cost-\$500K.

Project Location:

State of Washington

Partner(s):

Washington State DOT; Amtrak; Chelan County; Washington State Ferries

Start Date: September 1999

End Date: December 2001

STATE OF WISCONSIN ITS INTEGRATION

Description:

This activity seeks to develop a Statewide programmatic project development and budgeting approach over six years for Wisconsin ITS projects.

The State shall work to accomplish the following goals and objectives (where goals represent high-level descriptions of what the project will accomplish and objectives define specific actions that can be used as metrics for determining progress towards the goals).

Wisconsin proposes to accomplish deployment planning and begin implementation of rural incident, traffic management and traveler information systems along expanded parts of the rural Interstate corridors and major arterial networks in the State. This effort will concentrate on funding projects in the 1999, 2000 and 2001 State fiscal years.

The agreement will outline the State's commitment relating to the following projects and their integration into an overall Statewide system.

- High speed weigh-in-motion
- Statewide traveler information deployment
- Statewide ITS architecture
- Portable changeable message signs
- Interconnected signal systems for medium sized cities adjacent to interstate corridors

Project Location:

State of Wisconsin

Partner(s):

Wisconsin DOT, Wisconsin State Highway Patrol, Department of Motor Vehicles

Start Date:

September 1999

End Date:

December 2001

Estimated Total ITS Funds:

WARREN COUNTY, VIRGINIA

Description:

The three component projects in the Warren County, Virginia Northern Shenandoah Valley Rural Deployment Initiative result from the Lord Fairfax Planning District Commission's ITS Deployment Planning Study.

-- The "Travel Shenandoah Commercial Information Demonstration Project" (\$75K) will evaluate the market feasibility of providing real-time travel advisories and related information/assistance to motor freight dispatchers. Information will be provided via media requested by participating clients; e.g., e-mail, telephone, pager, fax.

-- The "University of Virginia's Department of Emergency Medicine Pegasus EMS Video Project" (\$40K) will provide portable video conferencing between local rescue squads and the Pegasus emergency medical helicopter. The project will enhance rural/interstate emergency medical service by upgrading the level/quality of patient information and medical consulting through real-time video conferencing from the incident scene/within the rescue squad transport vehicle and the Pegasus emergency medical transport helicopter.

-- The "Northern Shenandoah Valley Public Mobility Project" will develop a ridesharing, vehicle sharing demand responsive agency-based central dispatching system to enhance the efficient use of human service transportation resources in the Northern Shenandoah Valley.

Project Location:

Warren County, Virginia

Partner(s):

Virginia Department of Transportation; Frederick County, VA; University of Virginia; ShenTel

WAUSAU/STEVENS POINT, WISCONSIN

Description:

To implement this project, Wisconsin will conduct a planning study, develop a regional architecture and deploy interoperable technologies in the I-39 Wausau/Stevens Point Corridor which will be integrated into an overall statewide system.

Specific projects selected for ITS deployment will fulfill I-39 Corridor needs in traveler information, incident management and commercial vehicle operations. The intent of this corridor-wide project programming effort is to develop an accepted, standardized approach to deployment in the corridor.

Project Location:

I-39 Wausau/Stevens Point Corridor

Partner(s):

Wisconsin DOT; Department of Motor Vehicles

Start Date:

September 1999

End Date:

June 2001

**Estimated Total
ITS Funds:**

\$791,470

**Estimated Total

Emergency Services

AUTOMATED COLLISION NOTIFICATION (ACN) OPERATIONAL FIELD TEST

Description:

This project is an operational field test of an advanced in-vehicle system that determines that a serious collision has occurred and automatically summons Emergency Medical Services (EMS) response. The Team will design, build and deploy an automated collision notification system (ACN), using 1000 privately owned cars in a large area covering the western portion of New York State.

Project Location:

Erie County, New York

Partner(s):

CALSPAN Advanced Technology Center, the New York DOT, General Motors, Cellular One, Rockwell, Erie County Emergency Management Service

Start Date:

September 1995

End Date:

September 2000

**Estimated Total
ITS Funds:**

\$3,472,358

**Estimated Total
Project Cost:**

\$4,335,453

Arthur Carter

NHTSA Headquarters, NRD-12

(202) 366-5669

WASHINGTON STATE RADIO COMMUNICATION EMERGENCY CALL BOXES

Description:

This project will provide emergency call boxes using radio communications technology throughout the State Route 821 Corridor. State Route 821 follows the Yakima River through a canyon with no cellular phone coverage. There are few businesses or residences along the road so there is no place to stop for assistance. When roadway accidents or river rafting accidents occur, there is no timely way to alert emergency service providers. This project will remedy that condition. The Washington DOT will be able to incorporate the emergency call boxes into the Smart Trek Model Deployment Initiative.

Project Location:

Washington State

Partner(s):

Washington State DOT

Start Date:

October 1998

End Date:

October 2000

**Estimated Total
ITS Funds:**

\$750,000

**Estimated Total
Project Cost:**

\$987,500

Rural Crash Prevention

TRAVEL - AID

Description:

This project will use variable speed limit signs, variable message signs, and in-vehicle communications and signing equipment to improve safety along a 40-mile stretch of I-90 across Snoqualmie Pass, a rural area prone to snow, ice and poor visibility. Electronic sensing and equipment will be installed to monitor traffic, speeds, road and weather conditions. This information will help determine a safe speed. Warnings about road conditions, accidents, or slow-moving equipment will be broadcast via the various devices. The in-vehicle message device would have an alert signal to inform the motorist that a message is available. Up to 200 vehicles will be equipped with devices to deliver information similar to that displayed from the roadway variable message sign system.

Project Location:

Snoqualmie Pass, Washington State

Partner(s):

Washington State DOT, Farradyne Systems Inc., Engineering Research Associates (ERA), General Logistics, Surface Systems Incorporated (SSI), University of Washington - Washington State Transportation Center (TRAC), and Traffic Master

Start Date:

November 1992

End Date:

May 2001

Estimated Total ITS Funds:

\$1,828,525

Estimated Total Project Cost:

\$4,700,291

Rural Transit Mobility

NORTH FLORIDA RURAL TRANSIT INTELLIGENT TRANSPORTATION SYSTEMS

Description:

This project will assist in providing regional, multi-agency application of Intelligent Transportation Systems (ITS) technologies to three different countywide rural transit systems in Flagler, Putnam, and St. Johns counties in north Florida. The resulting electronic coordinated transit service provides transportation for the public for the purpose of job training, employment, medical service, nutrition trips, rehabilitation, and other life-sustaining functions. This project will be a national model in initiating regional, electronically coordinated transit service in rural areas involving several transit organizations. ITS technologies being considered include automatic vehicle location (AVL) systems using geographic positioning systems (GPS), and automated scheduling, dispatching, and billing software.

Project Location:

Florida

Partner(s):

Flagler County Transport; ARC Transit of Putnam County, St. John's County Council on Aging; Florida Commission for the Transportation Disadvantaged

Start Date:

September 1997

End Date:

May 2002

Estimated Total ITS Funds:

\$200,000

FITCHBURG, MASSACHUSETTS-MONTACHUSETT REGIONAL TRANSIT AUTHORITY ITS INTEGRATION

Description:

The principal objective of the Montachusett Regional Transit Authority (MART) ITS Integration Program is to enhance and expand transportation and transit mobility throughout the MART service area and beyond. In order to achieve this objective, MART will use existing services offered by MART in urban and rural areas to provide enhancements to existing transit services, traveler information systems and newly developed ITS projects.

The main focus of the project will be the use of computerized systems to enhance management and deployment of demand responsive and fixed route services. This project will use the existing vehicle fleet and transit management system for fixed route, paratransit and demand responsive dispatching. The new initiatives to be pursued include design and implementation of a Global Positioning System-based Automated Vehicle Locating System complemented by Geographic Information System mapping for real-time dispatching and management.

A second feature of the project is the implementation of a traveler information system using transit vehicles as probes. Through establishment of information exchange mechanisms between local and state government agencies and the media, MART will serve as a public information center supported by web sites and toll free telephone services.

Project Location:

Fitchburg, Massachusetts-Montachusett Area

Partner(s):

Massachusetts Highway Department, Montachusett Regional Transit Authority (MART), Montachusett Regional Planning Agency, Massachusetts Bay Transit Authority

Rural Traffic Management

RURAL ITS SWISS ARMY KNIFE TRAILER

Description:

Many rural locations lack a core set of permanently installed transportation management equipment components. Variable message signs, highway advisory radio, traffic control devices, communications media and speed detection devices are examples of components needed under circumstances, but not permanently deployed, in rural areas. This project will develop a set of compatible Swiss Army Knife (SAK) trailers as multi-purpose devices capable of supporting a broad range of applications as required. The intent of the SAK trailer is to provide a full complement of core equipment components in a single package to support: Work zone management; special event management; incident management; national disaster management; and traffic data collection.

Components visualized on the self-contained trailer include: a variable message sign; highway advisory radio; a portable traffic signal; weather sensor; radar speed detection; video surveillance; wireless communications; flood lights; and a power source.

Project Location:

New York State-Variou Rural and Small Urban Areas

Partner(s):

New York State DOT, Local Government and Public Safety Agencies in various communities

Highway Operations and Maintenance

AN AUTOMATED VEHICLE LOCATION PILOT SYSTEM IN A MAINTENANCE OPERATIONS SETTING

Description:

This project will evaluate the use of an Automated Vehicle Location (AVL) system to aid in the administration of snow removal and ice control contract forces, and provide information concerning road conditions to the public and media and the management and performance of snow removal and ice control operations. The benefits anticipated from this system include: continuous location of snowplow fleet operations; ability to identify vehicles with abnormal behavior; increased safety for the vehicle operator; ability to detect and minimize waste and fraud; ability to capture statistical data; and improved communications efficiency. The evaluation will also focus on the benefits of incorporating snow and ice removal status received from the AVL system into traveler information programs in the Northern Virginia District.

Project Location:

Northern Virginia District

Partner(s):

Virginia DOT

Start Date:

August 1997

End Date:

September 2000

Estimated Total ITS Funds:

ALASKA COLD WEATHER ITS SENSING

Description:

This project would fund the initial development of a Roadway Weather Information System (RWIS) for the Alaska Department of Transportation and Public Facilities. This initial improvement would include two small operational RWIS systems, centered in the Anchorage and Valdez areas, and also would install several data collection sites in Juneau. The system would provide weather and pavement information to support maintenance and operations activities, particularly winter snow and ice control on highways.

Project Location:

Anchorage and Valdez, Alaska

Partner(s):

Alaska DOT and PF

Start Date:

October 1998

End Date:

September 2000

**Estimated Total
ITS Funds:**

\$1,000,000

**Estimated Total
Project Cost:**

\$1,250,000

OAKLAND COUNTY, MICHIGAN – SOUTHEAST MICHIGAN SNOW AND ICE MANAGEMENT (SEMSIM)

Description:

The Southeastern Michigan Snow and Ice Management (SEMSIM) project is a collaboration between the Road Commission for Oakland County, Wayne County, The Road Commission of Macomb County, and the City of Detroit. Additionally, the Suburban Mobility Authority for Regional Transportation (SMART) is a partner in the project, and the University of Michigan Intelligent Transportation Systems Research Center of Excellence is the project facilitator. SEMSIM will enhance the management of winter road maintenance in Southeast Michigan through cross-jurisdictional cooperation and the application of state-of-the-art technology. The SEMSIM project will be a unique integration of automated vehicle location (AVL) using the global positioning system (GPS), geographic information systems (GIS), and communications technologies designed specifically to enhance the efficiency and effectiveness of winter maintenance operations in urban, suburban, and rural areas. The ultimate result will be minimizing the amount of time which roads are hazardous thereby improving roadway safety. Improved mobility and reduced congestion will be a result of roadways which return to maximum capacity quicker by including software displaying road network status, vehicle status, and meteorological data in real time.

The project will integrate existing or soon to be deployed ITS infrastructure components. The back-bone of this project is the communications between the maintenance vehicles and the central computers.

This project is phased. Phase I, begun in October 1998, is scheduled for completion on 12/31/2000. Phase II will continue the deployment initiatives, and is scheduled for completion on 12/31/2001. Cost estimates displayed are for both phases.

Project Location:

Oakland Co., Wayne Co., Macomb Co., City of Detroit, Michigan

Partner(s):

Michigan DOT; Road Commission for Oakland County (RCOC); Wayne County, MI; Road Commission for Macomb County, MI; City of Detroit, MI; Suburban Mobility Authority for Regional Transportation

Start Date:

September 1998

End Date:

December 2001

**Estimated Total
ITS Funds:**

\$1,150,000 - Phase I

\$791,470 - Phase II

**Estimated Total
Project Cost:**

\$2,238,750 - Phases I and II

Completed Projects

BLACKSBURG RURAL TRAVELER INFORMATION SYSTEM

Description:

This project operationally tested a rural transit traveler information system that makes the transit system easier to use and more reliable for the user. Based upon a system-wide AVL, a real-time traveler information system was provided through kiosks, wayside stops, and an existing "electronic village". Blacksburg Transit (town of Blacksburg, VA) operates twenty-seven buses on eight fixed-routes. Daily ridership is 8,500 during the academic year. The transit system covers 642,000 miles annually, which includes a five-vehicle demand-responsive system.

Project Location:

Blacksburg, Virginia

COLORADO MAYDAY SYSTEM

Description:

This project evaluated the use of the Global Positioning System (GPS) for vehicle location and the impact of cellular infrastructure communications between the vehicle and Public Service Answering Points (PSAPs) providing emergency and non-emergency assistance in an area of over 12,000 square miles in north-central Colorado. The test involved vehicles equipped with a low-cost location device called TIDGET. The TIDGET sensor sends raw GPS satellite signals to the control center for processing to determine the location of the vehicle. The primary objective of this test was to evaluate the impact of an infrastructure-based GPS system and response network on emergency response activities, time and public safety. Additionally, this test identified the necessary structure, responsibilities and service levels of a traveler assistance center necessary to commercially operate such a system.

Project Location:

Central - Northeast Colorado

EVALUATION OF RADIO AND MICROWAVE TECHNOLOGY FOR MOTOR VEHICLE SAFETY WARNING SYSTEMS

Description:

This cooperative agreement had two (2) objectives:

(1) To assist the Federal Highway Administration (FHWA) in evaluating the utility of a prototype motor vehicle safety warning system that utilizes police radar frequency transmissions to alert drivers (in real-time) of hazardous road conditions;

(2) To characterize system technical requirements for an effective warning system, and to evaluate the performance of the prototype system.

Project Location:

Georgia

IDENTIFICATION OF SIMPLE SOLUTIONS FOR THE RURAL TRANSPORTATION SYSTEM

Description:

There were four (4) tasks associated with this cooperative agreement:

- (1) An information search to identify the successful, small-scale technology applications appropriate for rural areas;
- (2) An assessment and evaluation of the most promising applications;
- (3) The documentation of these solutions and other findings;
- (4) The presentation of these findings at the appropriate venues.

Final report, Technology in Rural Transportation: Simple Solutions, has been published.

TRANSCAL

Description:

This project was a comprehensive Inter-Regional Traveler Information System, integrating road, traffic, transit, weather, and value-added traveler services information sources from the entire geographic region. The location of the project is along the I-80/US 50 corridor between San Francisco, California and Lake Tahoe/Reno, Nevada. Land line and cellular telephone, and wireless FM subcarrier networks were used to transport information to and from travelers via telephones, personal digital assistants, in-vehicle devices and kiosks. Additionally, the test assessed the ability to integrate information from multiple sources (urban, rural, rough terrain, severe weather, etc.), and the ability to integrate traveler services and transit information with real-time regional congestion and incident content.

Project Location:

California and Nevada

Partner(s):

IV. COMMERCIAL VEHICLE ITS INFRASTRUCTURE

IV. COMMERCIAL VEHICLE ITS INFRASTRUCTURE

The Commercial Vehicle ITS Infrastructure is based on the creation of nation-wide electronic systems and networks which enable simple, cost-effective and seamless exchanges of critical data associated with safety and administration, electronic business transactions, and commercial vehicle operations and processes. This electronic framework is known as Commercial Vehicle Information Systems and Networks (CVISN).

The elements of CVISN are summarized as follows:

- Safety assurance programs and services designed to assure the safety of commercial drivers, vehicles and cargo. These include automated roadside safety inspections and carrier reviews, safety information systems, and onboard safety monitoring.
- Credentials administration programs and services designed to improve the desktide procedures and systems for managing motor carrier regulation. These include electronic application, purchase and issuance of credentials, as well as automated tax reporting and filing.
- Electronic screening systems and services designed to facilitate the verification of size, weight, and credential information. These include the automated screening of commercial vehicles at fixed weight stations and international border crossings.
- Carrier operations activities and services designed to reduce congestion and manage the flow of commercial vehicle traffic such as travel advisory and hazardous materials incident response services. The private sector is taking the lead in implementing fleet and vehicle management technologies and systems that improve motor carrier productivity.

Under the auspices of ISTEA, the commercial vehicle applications which comprise CVISN were researched, developed and tested. Recent program efforts have centered on integrating these applications into CVISN and deploying them at pilot and model deployment sites across the Nation. This component of the ITS/CVO Program is the Model Deployment Initiative.

CVISN is not a new information system, but rather a way for existing systems to electronically exchange information through the use of standards and the commercially available communications infrastructure in the U.S. CVISN includes information systems owned and operated by state/local governments, carriers, and other stakeholders. It does not include the sensor and control elements of ITS/CVO technologies. CVISN will increase the safety and productivity of commercial operations and serve to educate key state and industry decision-makers, and the general public, on the costs and benefits of advanced technology for CVO.

The CVISN deployment strategy is divided into 5 phases. Phase 1 developed the management plans and technical frameworks necessary to coordinate the subsequent phases. Phase 2 is prototyping the technology, in a live environment, to demonstrate the operational concepts and validate the requirements. Phase 3 is the model deployment. Eight states from all regions have been funded to pilot safety, credentials and clearance services, and related technologies developed during the Prototype Phase. Phase 4 is expansion to additional states in the same regions. Phase 5

allows for full deployment of CVISN to all interested states. By this time, the technology, concepts, costs, and benefits should be well understood and documented. The end result would be deployment of the CVISN and technologies in a straightforward manner with little unforeseen risk to the public or private sector.

Research and Development efforts, operational tests and deployments are focused on supporting major commercial vehicle initiatives whose aim is to foster deployment of the integrated and interoperable systems which comprise CVISN. Research and development efforts focus on development of system components facilitating electronic identification and screening of vehicles and drivers. These include continuation of work on roadside identification and screening automation of the inspection process, to include pen-based computers, brake testing technologies and the development of the safety and fitness electronic records system (SAFER). Complementing efforts focus on development of on-board safety systems addressing driver fitness, vehicle diagnostics and black box development.

Operational tests support electronic screening to provide automated verification of properly documented trucks at weigh stations, hazardous materials management, one-stop shopping allowing computerized administration of credentials and permits, and automation of roadside safety applications which provide electronic access to carrier safety and licensing status. A major thrust of several operational tests supports the International Border Crossings Program. This program, cooperatively administered by USDOT and the Departments of Treasury and Justice, is directed at modernizing the methods for clearance of commercial vehicles at border crossings with Canada and Mexico. With the objective of facilitating safe and expeditious movement of commercial vehicles entering and exiting the United States, the agencies, in conjunction with their counterparts in Canada and Mexico, have tested a prototype system known as the North American Trade Automation Prototype (NATAP). Those tests expanded the traditional scope of CVO projects to include processes for automating verification of customs declarations for cargo clearance and the Immigration and Naturalization Service's clearance of drivers.

Mainstreaming is a major element of the ITS/CVO Program. The purposes of the CVO Mainstreaming program are to provide training, outreach and technical assistance to accelerate the deployment of CVISN, ITS/CVO technologies and programs. CVO includes streamlining the administration of motor carrier regulations, focusing safety enforcement activities on high-risk carriers, and reducing congestion costs for motor carriers. The objectives of the CVO Mainstreaming program are to:

- Provide regional workshops to train state managers and technicians to scope, design, and deploy CVISN;
- Increase the states' and carriers' technical and institutional capacity to implement CVO/CVISN;
- Incorporate ITS/CVO more fully into state and metropolitan transportation planning activities;
- Coordinate ITS/CVO activities among agencies and among states; and
- Explain the ITS/CVO program to key decision makers in the public and private sectors.

Safety Assurance

DYNAMIC TRUCK SPEED WARNING FOR LONG DOWNGRADES

Description:

This project provides for the installation of a weigh-in-motion station to determine the weight of each truck passing the site (ignoring vehicles under 30,000 pounds GVW) and for the installation of loops to determine vehicle speed. Using the weight and configuration of the vehicle, the safe descent speed is computed from the algorithm published in FHWA-RD-79-116 "Feasibility of a Grade Severity Rating System" as modified by "The Development and Evaluation of a Prototype Grade Severity Rating System." The vehicles are advised of the safe speed using variable message signs.

Electronic Screening

ELECTRONIC CLEARANCE FOR INTERNATIONAL BORDERS

Description:

The Office of Motor Carrier Safety is overseeing a coordinated set of operational tests whose purpose is to demonstrate commercial vehicle electronic clearance at international borders including proper identification of Mexican and Canadian motor carriers by using innovative Intelligent Transportation Systems technology. These projects comprise a comprehensive effort designed to support the development of a comprehensive North American system design and standard for international border crossings. The project sites are located at:

* Detroit, Michigan, and Buffalo, New York Crossings (Ambassador Bridge and Peace Bridge)

* Otay Mesa, California Crossing (IBEX)

* Nogales, Arizona Crossing (EPIC)

* Laredo and El Paso, Texas Crossings (TRIBEX)

A key element of these tests is integrating the North American Trade Automation Prototype (NATAP), an initiative of the U.S. Treasury Department.

In addition, while not part of the NATAP, two additional crossings at Blaine, Washington, and Sweetgrass, Montana, were Congressionally directed to be developed for electronic clearance.

All project activity at the border crossings has terminated except at the El Paso-Laredo site (TRIBEX). Activity at this site has transitioned to a demonstration/deployment and is not being evaluated. Final reports for the Buffalo, NY crossing site (Peace Bridge) and the Arizona site (EPIC) have been completed and are available on the JPO EDL. The final evaluation report for the Ambassador Bridge (Detroit, MI-Windsor, Ontario) site is expected by January 31, 2000.

Project Location:

The city and states enumerated above.

ITS/CVO GREENLIGHT PROJECT

Description:

The Oregon ITS/CVO Green Light Project will improve the safety and efficiency of commercial vehicle operations and increase the performance of the highway system. The project will electronically verify safety and weight information of drivers, vehicles, and carriers from fixed and mobile roadside sites at highway speeds. The Green Light project will be interoperable with the HELP, Inc. and ADVANTAGE CVO electronic clearance efforts to form the national deployment of an electronic information network for commercial vehicles and States.

The primary features of this effort are to:

- * Deploy mainline electronic pre-clearance sites;
- * Deploy integrated tactical enforcement sites;
- * Create safety enhancements including electronic access to driver/vehicle/carrier safety status, downhill speed control notification systems, and road/weather conditions;
- * Integrate vision technology for vehicles not equipped with transponders;
- * Provide hardware/software upgrades and database management and development to support the project; and
- * Perform an independent objective evaluation of the project.

COUTTS/SWEET GRASS AUTOMATED BORDER CROSSING PROPOSAL

Description:

This project will pursue the development and deployment of ITS applications to expedite the movement of commercial motor carrier traffic back and forth across the U.S./Canadian border at the Coutts/Sweet Grass crossing. The Montana and Alberta jurisdictions involved in the project are pursuing the development and deployment of a "seamless" international border crossing. The resulting technology-based environment is intended to improve on the cooperation, operations and regulatory process which currently exists.

This project is just one of a number of other larger improvement projects which are also proceeding to address the entire border crossing facility. The overall objectives of this initial ITS project are to (1) develop weigh station criteria that are acceptable to both agencies in addressing safety, credential and fuel issues; (2) establish a database of commercial carriers who agree voluntarily to abide by the developed criteria; (3) install weigh-in-motion (WIM) systems that assure size and weight compliance among carriers; and (4) evaluate the success of the system.

Project Location:

Coutts, Alberta and Sweetgrass, Montana

Partner(s):

Western Transportation Institute, Montana Department of Transportation, Alberta, Canada

Carrier Operations

NATIONAL INSTITUTE FOR ENVIRONMENTAL RENEWAL (NIER)

Description:

This project is designed to demonstrate the feasibility of utilizing computerized emergency response information, including telecommunications technologies, to provide hazardous materials information to emergency response units.

Phase I objectives are to:

- * Identify contents of shipments of hazardous materials transported by motor carriers, and

- * Link systems that identify, store and allow retrieval of data for emergency response to incidents and accidents involving transportation of hazardous materials by motor carriers either directly or through links with other systems.

Phase I is complete.

During Phase II, the project has been expanded to include the OPERATION RESPOND System and intermodal movements at the port of Los Angeles.

Project Location:

Phase I, Mayfield, Pennsylvania: Phase II, Port of Los Angeles, California

OPERATION RESPOND

Description:

This project is designed to provide an electronic link with 911 operators and participating carriers during the initial response to hazardous materials accidents. The project is currently being expanded to establish computerized information systems for emergency responders and participating railroads and motor carriers serving Mexican and Canadian border crossings. The crucial information provided by this innovative system will enable emergency responders to have real-time access to hazardous materials information on the scene across North America to facilitate assessment of situations and to determine appropriate immediate action. This will further ensure the safety of the public and emergency personnel.

Integrated Systems

CVISN - MODEL DEPLOYMENT (COMMERCIAL VEHICLE INFORMATION SYSTEMS & NETWORKS)

Description:

The model deployment of CVISN is focused on safety information exchange, roadside electronic screening, and credentials administration. Safety Information Exchange provides carrier, vehicle and driver safety information to roadside enforcement personnel and other authorized users. Roadside Electronic Screening provides for screening vehicles that pass a roadside check station, determining whether further inspection or verification of credentials is required, and taking appropriate actions. Vehicle-to-Roadside communications via transponders and readers/writers facilitate the screening functions at mainline speed. Weigh-in-Motion provide for high speed, mainline weighing. Credentials Administration provides for electronic application, processing, fee collection, issuance and distribution of CVO credentials, support of base State agreements and provides for CVO tax filing/auditing.

Status - The model deployment states have completed their CVISN project plans design and three states (MO, VA, KY) will have completed CVISN level one by January 30, 2000. Three additional states (MN, CO, CA) will be complete by December 30, 2000.

Completed Projects

ADVANTAGE CVO

Description:

Advantage CVO, formerly Advantage I-75, represents a multi-state partnership of public and private sector interests along the I-75 corridor. The project facilitated motor-carrier operations by allowing transponder-equipped and properly documented trucks to travel any segment along the entire length of I-75 at mainline speeds with minimal stopping at weigh/inspection stations. Electronic clearance decisions at downstream stations were based on truck size and weight measurements taken upstream and on computerized checking of operating credentials in each state. Advantage I-75 features the application of transponder technology and decentralized control, with each state retaining its constitutional and statutory authority relative to motor carriers and their operations. Four thousand trucks participated in the project. Federal ITS funds ended in September 1997. The participating States are continuing and are proposing to expand to 20,000 trucks.

Project Location:

I-75 in Florida, Georgia, Tennessee, Kentucky, Ohio, Michigan and Ontario

ASSESSMENT OF STATE BENEFITS AND COSTS FROM ITS/CVO SERVICES

Description:

The purpose of this study was to assess the benefits and costs of Intelligent Transportation Systems/Commercial Vehicle Operations (ITS/CVO) technology applications for States nationwide. This project had two distinct phases. Phase 1 consisted of the development of an education tool for Governors that will provide a policy analysis of ITS activities at the Federal level and the implications on transportation systems in their States. Phase 2 consisted of an in-depth economic assessment of the costs and benefits of ITS/CVO technology applications from a State perspective. In addition to this economic assessment, State business plans for the deployment and operation and maintenance of the ITS/CVO applications were also developed. The Governors of the United States, Territories, and Commonwealths of America have worked through the National Governors' Association (NGA) to deal collectively with issues of public policy and governance. The NGA's ongoing mission is to support the work of the Governors by providing a bipartisan forum to help shape and implement national policy and to solve State problems. The Center for Policy Research is the research and development arm of the NGA. The center is a vehicle for sharing knowledge about innovative State activities, exploring the impact of Federal initiatives on State government, and providing technical assistance to States. The center works in a number of policy fields, including economic development, information management, and transportation. The priorities for the NGA's research are set by the Governors.

AUTOMATED SAFETY ASSESSMENT PROGRAM

Description:

The primary objective of the Automated Safety Assessment Program (ASAP) was to obtain data from the motor carrier that will enable the Office of Motor Carriers (OMC) to detect the motor carrier's safety performance without going to the carrier's place of business at a significant cost in time and money. The ASAP program allows motor carriers to present information, through an electronic means, to the OMC regarding their compliance with the Federal Motor Carrier Safety Regulations. The ASAP program consists of menu-driven software that will be provided to eligible motor carriers. The motor carriers would load the software into microcomputer systems and complete a data input process. The data would be downloaded to the Office of Motor Carriers for validation and analysis.

AUTOMATED SAFETY ASSESSMENT PROGRAM (ASAP) PILOT ON HAZARDOUS MATERIAL CARRIERS

Description:

Currently, Office of Motor Carriers (OMC) is researching new technology, known as the Automated Safety Assessment Program (ASAP), to allow electronic transmission of data from motor carriers. This technology helped to fill voids present in the Motor Carrier Management Information System (MCMIS), including additional carrier accident information not previously maintained. ASAP enables a motor carrier to submit information electronically to OMC on its compliance with the Federal Motor Carrier Safety Regulations (FMCSRs) and Hazardous Materials Regulations (HMRs).

The ASAP program also speeds the needed receipt of information about new motor carriers. OMC resources focus on carriers that pose the greatest risk on the highway. Studies show that new motor carriers are more likely to be involved in an accident. However, shortages in data relating to new carrier operations critically affect our ability to access these carriers' safety performance. Because OMC relies on MCMIS data to determine risk, the absence of new carrier safety data in MCMIS poses a significant problem.

The Associate Administrator for Motor Carriers requested this pilot study. It assessed the feasibility of ASAP software, as an option to the current Hazardous Materials (HM) permitting program, as an effective means to ascertain whether a HM permit carrier can be authorized to operate in interstate transportation. Congress has supported the development of this program.

CVISN - DESIGN OF A COMMERCIAL VEHICLE INFORMATION SYSTEM NETWORK

Description:

FHWA has designed, tested, and evaluated ITS technology to provide automated clearance, electronic credential purchasing, and automated roadside safety information processing for interstate and intrastate Commercial Vehicle Operations (CVO). Currently commercial vehicles are stopped at state borders and checked for size and weight violations. While these are necessary checks, they cause millions of dollars in lost productivity.

An information system is required to allow commercial vehicles to be cleared as they pass at highway speeds. Also, commercial vehicle operators must spend time and effort gathering appropriate credentials (permits) from each state and agency they do business with. Electronic purchasing of credentials and permits would reduce the administrative burden on carriers significantly and help to streamline the states' process of issuing credentials. Additionally, to facilitate the decision process regarding high-risk carriers, the intent is to provide real-time safety data. A national information systems architecture is being designed to support various scenarios. Models of the system have been developed to evaluate those alternatives that best support user services. Subsequently, the system will provide the design for a national CVO information system network. Testing occurred in two (2) prototype states and eight (8) pilot states.

CVISN - PROTOTYPE OF A COMMERCIAL VEHICLE INFORMATION SYSTEM NETWORK

Description:

The FHWA designed, tested, and evaluated Intelligent Transportation Systems technology to provide automated clearance for interstate and intrastate Commercial Vehicle Operations (CVO). Currently, commercial vehicles are stopped at state borders and checked for credentials, weight and safety parameters. While these are necessary checks, they cause millions of dollars in lost productivity. An information system is required to allow commercial vehicles to be inspected as they pass at highway speeds. A national information system architecture is being designed to support this and other key National CVO information system needs. The national information system architecture was prototyped by this effort.

DEVELOPMENT, EVALUATION, AND APPLICATION OF BRAKE TESTING DEVICES-BATTELLE MEMORIAL INSTITUTE

Description:

The Office of Motor Carriers has contracted with Battelle Memorial Institute to evaluate and test devices that show substantial promise of increasing the efficiency of roadside inspections. Several State inspection/enforcement agencies have tested a variety of brake devices in conjunction with Commercial Vehicle Safety Alliance Level 1 brake inspections on commercial vehicles (heavy trucks and buses). These joint inspections, combined with daily use, training, and maintenance records, provide data from which an objective evaluation of the technologies can be made. The project assessed a variety of technologies including roller dynamometers, flat-plate testers, infra-red detectors, torsional devices, and decelerometers.

ELECTRONIC ONE-STOP SHOPPING OPERATIONAL TESTS

Description:

The HELP, Inc., Midwest States, and SW States Electronic One-Stop Shopping Operational Tests are comprised of 14 states. The projects tested different approaches to one-stop, multi-state electronic purchase of credentials from locations such as motor carrier facilities, permitting services, truck stops and state agencies. The carriers were able to purchase registration, fuel tax, authority, and over-dimensional permits from participating states through the systems. Credentials could be delivered electronically to the requesting location or to a location specified by the carrier. The carriers would electronically request and pay for credentials through their base state or individual states. The primary objective of these tests was to evaluate improvements in state and motor carrier productivity from a one-stop electronic system which will make it possible for a motor carrier to apply for, pay for, and receive all necessary credentials or permits electronically either from the base or individual states.

ITS/CVO COMMUNICATIONS-OUTREACH PLAN

Description:

The ITS/CVO Communications-Outreach Plan, designed and oversaw development and production of the necessary communications tools to assure that the ITS/CVO program is fully communicated to selected audiences. Major areas of emphasis included:

I. Communications

- Product dissemination plan
- ITS/CVO promotional, educational and presentation materials
- Bi-lingual education, presentation materials
- Portable ITS/CVO exhibit displays
- National Listening Session
- Media Relations strategy and campaign
- National database for ITS/CVO technology information

II. Outreach

- National Focus Groups Meetings
- ITS/CVO Training Course

Additionally, the Coordinator planned, and oversaw development of a variety of outreach activities designed to educate and inform selected audiences while gaining support and participation in the ITS/CVO program.

ON-BOARD DRIVER MONITORING/FITNESS-FOR-DUTY TESTING

Description:

This pilot test evaluated the ability of a lane tracking device to monitor a driver's fitness-for-duty. Drivers using this device establish a "base" for their ability to keep a vehicle in its lane. If deviation is detected, the driver is notified. If it continues, both the driver and the carrier are notified. The driver then stops the vehicle at the closest safe location and takes a five-minute test. Depending on the test results, the driver may continue driving or may be required to sleep before resuming driving responsibilities.

OUT-OF-SERVICE VERIFICATION OPERATIONAL TESTS

Description:

Two operational tests were conducted that utilized technologies that provide automatic, real-time out-of-service verification at the roadside. The Wisconsin/Minnesota project utilized video identification equipment and a database which would be created containing key out-of-service data on specific vehicles. Subsequent downstream identification of vehicles determined whether or not a vehicle is in violation of an out-of-service order. The Idaho project utilized AVI tags, video imaging analysis and an inspection site alarm system that would be activated when an out-of-service vehicle attempts to leave. The Minnesota/Wisconsin test was completed first on the completion date below. The Idaho test report is scheduled for Spring (March or April) 2000.

PASS

Description:

PASS (Port-of-Entry Advanced Sorting System) was a test of mainline sorting at Oregon's Ashland Port-of-Entry on northbound I-5. The project examined integrating Automatic Vehicle Identification (AVI), Weigh In Motion (WIM) and Automated Vehicle Classifications (AVC) to identify, weigh, classify and direct selected heavy vehicles in advance of weigh stations and ports-of-entry. Legally operating trucks participating in the project were directed, by the use of an in-vehicle device, to bypass the port and the static scale weighing process, resulting in time savings for both the carrier and the port personnel.

ROADSIDE MCSAP COMPUTER SYSTEM (200 SITES)

Description:

This Congressionally mandated project had the goal of providing by December 31, 1995, carrier safety data and driver license status to the roadside for at least 100 MCSAP inspection sites; and by mid-1997, the additional capability to access this data electronically via communications from at least 200 MCSAP sites. This project uses information systems technology to better target inspections, improve driver license checks, and provide for electronic recording and uploading of inspection data via portable computers.

The project encompasses the following projects:

- * Development of a functional vehicle driver inspection system (ASPEN),
- * Evolution of roadside data communications options (SAFER),
- * Development of Inspection Selection System (ISS).

Status - A first generation ASPEN inspection system (for DOS) was deployed in 1995 in 25 States. It was replaced in 1996 by a second generation ASPEN written for Windows. This version currently is deployed in 45 States and is in use by approximately 2,000 law enforcement officers. The pen-computer strategy has given way to a laptop computer strategy because of limitations in pen-computer hardware technology. Widespread use of ASPEN greatly has improved inspection accuracy, inspection report readability, and timeliness of data transfer into the National information system. A third generation rebuild of ASPEN into a 32-bit system for WindowsNT is slated for 1998.

The Inspection Selection System (ISS) was developed and deployed in 45 States with great success. Societal benefits have been calculated to exceed \$60 million per year (see final ISS report). A version of ISS for voice input has been developed and is being tested. To tie ISS closely with OMC's SAFESTAT carrier prioritization algorithm, a second generation ISS, based closely on SAFESTAT, currently is under development.

The SAFER communications system is a many-faceted project and is still under development. Currently, functional parts include:

- * Inspection transfer via a data mailbox system,
- * Unknown carrier name & address and "snapshot" lookup,
- * Weekly refresh of local ISS carrier snapshot databases,
- * Carrier information availability via the Internet.

The next major addition to SAFER was implementation of a 30-day past inspection database, and query retrieval system. This was operational by Summer 1998 with release of ASPEN version 1.4.

Widespread deployment of SAFER to State users has proved to be more complex than originally anticipated. Currently, SAFER use is limited to beta testing with about 30 users in three States (CT, DE, NY).

V. INTERMODAL FREIGHT

V. INTERMODAL FREIGHT

To maximize the capacity of the nation's transportation infrastructure, it is important to plan and manage transportation assets as a single intermodal system. This is especially vital given the rapid growth of the intermodal freight business. Between 1985 and 1995, the number of intermodal containers moving through ports worldwide doubled. In the next two decades, the volume of marine trade is expected to triple. Intermodal freight moved by truck has grown comparably with the increase in volumes via maritime, air, and rail modes, and is expected to keep pace. These increased volumes of intermodal freight movement will have a severe impact on the nation's highways, rail lines, waterways, and ports of entry.

Advanced information and communications technologies applied across the intermodal system offer important opportunities to strengthen the links between the separate modal systems, which are currently run as competing options with minimal cooperation between one another. U.S. DOT's Intermodal Freight Program is laying the groundwork to utilize ITS technology to help both the public and private sectors bridge the modal interfaces in the Nation, and at the borders with Canada and Mexico. The end goal of the Intermodal Freight Program is to provide safer, more reliable, and more efficient intermodal freight mobility over the Nation's surface and maritime infrastructure. Better mobility will benefit both metropolitan communities and the freight community, while also contributing to U.S. DOT's strategic goals of mitigating congestion, enhancing economic performance, and ensuring national security.

In support of the Intermodal Freight Program's goal to facilitate goods movements across our borders, FHWA's International Border Clearance program is providing an important link to trading partners in the North and South. In 1997 and 1998, FHWA conducted field operational tests at seven sites – five on the Northern border and two on the Southern border. The purpose of these tests was to examine the feasibility of using ITS technology to expedite the processing of safety information at international border crossings. These tests were carried out in cooperation with the U.S. Department of the Treasury, U.S. Customs Service, the Immigration and Naturalization Service, and our Canadian and Mexican partners.

Under TEA-21, intermodal freight research will be advanced by applying the technology and lessons learned from ITS operational tests and the metropolitan and Commercial Vehicle Information Systems and Networks (CVISN) model deployments. The hallmark of the ITS program is linking "stove piped" legacy information systems together to benefit the community at large. Linking information systems between the modes to provide an end-to-end information flow is expected to enhance and make more efficient the movement of freight through highly congested areas.

U. S. DOT believes that sharing information through systems linked by Electronic Data Interchange (EDI) standards can facilitate movements of intermodal freight by identifying and bypassing transportation bottlenecks at ports and on highways and eliminating stops for vehicle and cargo documentation that increase operating costs and contribute to congestion. This belief has been substantiated by input from the intermodal freight community. Over the past several years, U.S. DOT has sponsored numerous studies, conferences, and outreach initiatives on intermodal issues. A consistent message has been that a transportation system's physical infrastructure must effectively be complemented by a data communications infrastructure if the

system is to operate at its highest potential. Whether for transportation movements in general, or intermodal movements in particular, real-time data communications gives transportation managers and vehicle drivers a chance to quickly respond to system delays or new demands.

During fiscal years 1999 and 2000, FHWA will conduct two field operational tests in cooperation with the U.S. Customs Service to expedite the processing of U.S. DOT safety clearance concurrent with Customs' clearance through the National Customs Automation Program. The tests are taking place at the Ambassador Bridge in Detroit, Michigan, and the Columbia-Solidarity Bridge in Laredo, Texas. Further, the Corridor and Borders Program, established by TEA-21, is providing the opportunity to further deploy ITS applications to borders and corridors to expedite freight flows.

On border and corridor activities FHWA also is participating with the North American Free Trade Agreement (NAFTA) Land Transportation Standards Subcommittee and the Transportation Consultative Group on Science and Technology to conduct joint technology tests at border crossings. The objective is to develop technological standards that facilitate transportation and trade and are interoperable throughout North America.

Also during fiscal years 1999 and 2000, FHWA will conduct two intermodal freight operational tests. The first test, based in Chicago, will include the development of a secured multimodal electronic cargo manifest, allowing for the automated transfer of comprehensive cargo data across transportation modes and political jurisdictions. The primary objective of the test is to enhance operational efficiency for freight shippers and operators, while ensuring cargo safety and security for the public good. It will involve biometric smart card technologies to ensure system integrity and security. The system also will utilize an internet-based electronic manifest. Lastly, the project will be installed and beta-tested in Chicago's O'Hare Airport using approximately 10 manufacturers, 10-15 trucking companies, and 5-10 air cargo carriers and receivers that will be recruited by SecurCom and the American Trucking Associations (ATA) Foundation. After the beta-test is successfully completed, a second airport and supply chain will be added at Newark, New Jersey.

The second test, based in Seattle Washington, provides the opportunity to integrate ITS/EDI initiatives of transportation agencies and the intermodal freight industry in vehicle tracking, electronic clearance, traveler information, pick-up and delivery scheduling, incident management, and HAZMAT monitoring. The main objective of the test is to allow freight information to flow in advance of the physical movement of freight, and for this information to arrive at every checkpoint along the way in advance of the truck conveyance.

In FY 2001, the focus will be on developing intermodal freight user requirements as a building block leading to the eventual modification of the National ITS Architecture to include intermodal freight interfaces. In these ways, the Intermodal Freight Program will work to mitigate current congestion problems caused by intermodal freight demands upon the transportation system, while meeting the challenge of expected increased future traffic volumes. In 2002 and 2003, additional operational tests will be conducted.

Intermodal Freight

DEPLOYMENT OF ITS TECHNOLOGY TO FACILITATE MOVEMENTS OF INTERMODAL FREIGHT

Description:

The Washington State test will tag 10,000 intermodal containers and trailers with disposable electronic seals which will contain manifest information, gate release/arrival times, route plans, and other information that will allow the container/trailer to be used as a traffic probe for freight planning purposes. This test element will also be augmented with real-time, Internet- and radio-based traffic updates from existing ITS traveler information systems, and video cameras at port gates will report on queuing situations.

VI. INTELLIGENT VEHICLE INITIATIVE (IVI)

VI. INTELLIGENT VEHICLE INITIATIVE (IVI)

The personal, social, and economic costs of vehicle crashes are substantial. They include the pain and suffering from personal injury and death, as well as the direct costs sustained by injured people and their insurers and, for many crash victims, a lower standard of living or quality of life. The taxpayer and society may be further burdened by health care costs not paid by individuals or insurers, by lost productivity and associated loss of tax revenues, and by providing public assistance for injured people.

Each year more than 41,000 Americans lose their lives in highway crashes. Driver error is cited as the primary cause in about 90 percent of all police-reported crashes involving passenger vehicles, trucks, and buses. Over the last several decades, safety equipment in vehicles such as seatbelts and airbags, improved highway design, and anti-drinking-and-driving campaigns have led to major improvements in protecting people and improving overall safety. However, more than 6 million motor vehicle crashes continue to occur on our highways every year, causing approximately 5.2 million injuries, and costing more than \$150 billion per year.

Since the 1960s, government and industry have researched accidents to improve the crash worthiness of motor vehicles in order to reduce injuries and deaths caused by crashes. The intelligent vehicle program complements this work with research that focuses on preventing crashes in the first place. During the Intermodal Surface Transportation Efficiency Act (ISTEA) era, the U.S. Department of Transportation (U.S. DOT) conducted research in crash avoidance, in-vehicle information systems, and automated highway systems that pointed to new safety approaches and promising solutions with the ability to significantly reduce motor vehicle crashes. Preliminary estimates by the National Highway Traffic Safety Administration (NHTSA) show that rear-end, lane change, and roadway departure crash avoidance systems have the potential, collectively, to reduce motor vehicle crashes by one sixth, or about 1.2 million crashes annually. Such systems may take the form of warning drivers, recommending control actions, and introducing temporary or partial automated control of the vehicle in hazardous situations. These integrated technologies can be linked to in-vehicle driver displays that adhere to well-founded human factors requirements. The U.S. DOT has harnessed these efforts into one program, the Intelligent Vehicle Initiative (IVI).

During the period covered by ISTEA, the Intelligent Transportation System program conducted research and development efforts to improve driving safety and efficiency. These include the Advanced Collision Avoidance (ACA), Automated Highway System (AHS), and Driver Vehicle Interface (DVI) programs. The IVI program is building on the products of these programs and builds on the synergism inherent in their close coordination. Over the past five years, substantial accomplishments have laid the foundation for continuing research and development of collision avoidance systems. Extensive analysis, of crash data was performed to define collision problem areas and causal factors. Based on these and other considerations, such as related human factors research activities, projects were initiated to develop performance specifications for countermeasure systems. Progress has been made in the development of new research tools, such as efforts to design and build the Variable Dynamics Test Vehicle (VDTV) and the National Advanced Driving Simulator (NADS). The research program has established an extensive collision avoidance knowledge base, which is a key element in the U.S. DOT's efforts to facilitate

deployment. In addition, NHTSA has conducted operational tests to examine the capabilities and benefits of Intelligent Cruise Control (ICC) and Automated Collision Notification (ACN) systems. The AHS program integrated various control technology combinations in test vehicles, including passenger cars, trucks, buses, and highway maintenance vehicles. Integrated vehicle control and the potential acceptance of the systems were successfully demonstrated at the AHS Demonstration in 1997 on I-15 near San Diego, CA. The DVI program has completed design guidelines for advanced traveler information systems and has completed an upgrade of the Federal Highway Administration Highway Simulator (HYSIM) which will allow the conduct of more realistic simulation for studying the driver/vehicle interface.

Since the beginning of the period covered by the Transportation Equity Act for the 21st Century (TEA-21), the IVI program has been focused on eight problem areas. They are:

- *Rear-End Collision Avoidance* - A rear-end crash occurs when the front of a vehicle strikes the rear of a leading vehicle, both in the same lane. There are approximately 1.8 million police-reported rear-end crashes. These crashes accounted for more than 920,000 injuries and 1,160 fatalities. It is estimated that a significant percentage of these crashes would be addressed by collision avoidance systems that could sense stopped or moving vehicles in the forward lane.
- *Lane Change and Merge Collision Avoidance* - Lane change and merge crashes accounted for approximately 600,000 crashes. They occur most often on metropolitan arterial streets. A collision avoidance system that reduces this type of collision will also help decrease travel delays caused by this type of collision in addition to improving safety.
- *Road Departure Collision Avoidance* - Single vehicle road departure accidents represent the most serious crash problem based on the national crash data analysis. Analyses of crash data indicate that approximately 1.2 million police-reported crashes of this type occur each year. This number represents approximately 19 percent of the total crash problems and leads to more than 500,000 injuries and 13,000 fatalities. There are many different causes of these types of crashes, including weather/vision problems, driver impairment, and other improper driving behaviors. Due in part to these diverse causal factors, the development of countermeasure systems has significant technical challenges.
- *Intersection Collision Avoidance* - Intersections are among the most dangerous locations on U.S. roads. Approximately 1.7 million crashes occurred at intersections in 1998 (22 percent of total crashes), causing more than 6,700 fatalities and significant numbers of serious injuries. It is more technically challenging to prevent this type of crash with detection and warning technology than other crash situations. Because of these technical challenges, this is viewed as a longer term program area, but one with potentially large safety benefits.
- *Vision Enhancement* - Approximately 42 percent of all crashes and 58 percent of fatal crashes occur at night or during other degraded visibility conditions, according to NHTSA crash statistics. These 2.8 million annual police-reported crashes, including 23,000 fatal crashes, represent crashes for which reduced visibility may be a contributing factor. A number of interrelated factors contribute to the high crash rate at night, including alcohol, fatigue, and reduced visibility. Driver vision enhancement systems help drivers by providing an augmented view of the forward scene.

- *Vehicle Stability* - Commercial vehicle rollover crashes do not occur frequently, but the occurrence of rollover as a crash factor increases the likelihood of serious or fatal injury to the occupant. NHTSA data show that while rollovers are involved in 3 percent of all crashes for combination trucks, it was a factor in 13 percent of all fatal crashes of combination trucks. Various countermeasures are being considered to help reduce the incidence of commercial vehicle rollovers.
- *Driver Condition Warning* - NHTSA estimates that approximately 100,000 crashes annually are caused primarily by driver drowsiness or fatigue. Of these crashes, data from the Fatal Accident Reporting System indicate that drowsiness/fatigue was a factor in crashes in which more than 1400 fatalities occurred. Up to 40% of long-haul truck driver fatalities may be related to driver fatigue. The initial focus of this program area is on the commercial trucking segment for four key reasons: the extensive night driving in commercial operations; the need to minimize fatigue-related accidents among paid drivers; the high cost of commercial vehicle accidents; and the relative affordability of such systems for high-value heavy trucks. Ultimately, drowsy driver monitor systems should also be deployable at a lower cost in all passenger vehicles.

Driver Assistance – Safety Systems

ADVANCED VEHICLE CONTROL SYSTEMS INFRASTRUCTURE AND TRAFFIC IMPACTS

Description:

Several types of Advanced Vehicle Control Systems (AVCS) were studied by NHTSA, including run-off-the-road warning/avoidance and intersection collision warning/avoidance systems. This major research effort was expected to raise numerous issues concerning infrastructure interactions with these types of systems. In many cases, system concept feasibility is dependent on the affected infrastructure elements. This project addresses infrastructure-related issues in close coordination with NHTSA. Concurrently, these control systems are conceptualized and existing concepts evaluated to optimize traffic flow. The contracts are structured to conduct work on a task order basis; individual tasks are generated based on the status of ongoing AVCS efforts. A key focus is applications development for off-highway vehicle operations areas, such as intermodal terminals and busways. Another focus is highway maintenance vehicles. This project is also prototyping and testing infrastructure-based safety systems with a current focus on hazardous intersections. Final documentation will be available on completion date.

DRIVER PERFORMANCE, OLDER DRIVER - THE EFFECT OF FALSE ALARMS ON OLDER DRIVER RESPONSE TO FORWARD COLLISION WARNINGS

Description:

This project will perform a field experiment designed to investigate how drivers respond to rear-end collision warnings (RECW). The primary impetus for the proposed field experiment is the need to understand how false warnings, which are warnings presented in the absence of operationally defined threats, will influence driver responses to correct warnings of potential rear-end collisions. The study will address key issues with respect to exposure of drivers to false warnings. The factors that are expected to have the highest association with driver performance and behavior with RECW include *driver age, warning type (correct warnings, false warnings, correct rejections, false rejections), the time intervals between warnings (short vs. long), and distraction (road vs. in-vehicle glance location)*.

HAPTIC DISPLAYS FOR FORWARD COLLISION WARNING SYSTEMS

Description:

This project is a human factors study to evaluate haptic display characteristics that would make them effective in warning drivers of imminent crashes. Haptic displays are ones that are felt by the driver rather than heard or seen. Examples include steering wheel vibration and brief brake pulses. An experiment will be conducted to assess drivers' acceptance of alternative haptic displays and the manner in which drivers take control of the vehicle to avoid a collision with a vehicle or obstacle ahead. Drivers' behavior and reactions to forward collision avoidance systems (FCAS) in general, and the haptic feedback specifically, will be recorded using an instrumented vehicle. Questions such as whether haptic feedback is beneficial and elicits appropriate driver responses in terms of crash avoidance and whether drivers are comfortable with the manner in which the FCAS takes control of the vehicle will be assessed.

SYSTEM FOR ASSESSMENT OF VEHICLE MOTION ENVIRONMENT (SAVME)

Description:

The project is developing VME prototype hardware and software. This project is developing and validating a measurement system that can quantify the specific motions that vehicles exhibit as they move in traffic under the full array of traffic operations. In subsequent projects, the measurement system will be used to gather information such as reaction to other drivers cutting in front, normal following distance and typical lane change trajectories. This information will provide the foundation for development of ITS countermeasures that identify the need for intervention and/or collision avoidance instructions to the driver.

IN-VEHICLE DISPLAY ICONS AND OTHER INFORMATION ELEMENTS

Description:

The objective of this study is to develop analytically and empirically based design guidelines for in-vehicle icons. An extensive literature review of previous research related to icons was conducted as well as a preliminary assessment of visual symbols for in-vehicle systems. Together these made up the analytical phase of this project. The preliminary design guidelines are currently under development. This effort includes the input of a working group consisting of automotive and electronic designers, human factors professionals, and researchers. The resulting design guidelines from this work will feed directly into In-Vehicle Information Systems display guidelines such as FHWA's ATIS/CVO Design Guidelines.

IN-VEHICLE INFORMATION SYSTEMS BEHAVIORAL MODEL AND DESIGN SUPPORT

Description:

The In-Vehicle Information System (IVIS) Behavioral Model and Design Support System will include a set of design tools to assist in the design of an IVIS and a driver behavioral model to assess candidate IVIS. The behavioral model will be capable of taking IVIS design specifications and producing a prediction of driving behavior while using them. The design support system will be a set of human factors tools to be used in the design of in-vehicle information systems. The development of the IVIS Behavioral Model and Design Support System will require empirical research, analysis, and documentation of the design process for in-vehicle information systems. The behavioral model and the design support system will be implemented as a prototype software program and shall be viewed as a demonstration of the feasibility of the concept. The systems specification and Human Computer Interface Specification were recently submitted to FHWA for review.

TECHNICAL SUPPORT FOR IVIS DEVELOPMENT AND OPERATIONAL TEST

Description:

This project was initially titled "Development of An In-Vehicle Information System," and involved the technologies and issues associated with in-vehicle signing systems. It was expanded to include evaluations of an in-vehicle information system for handling all sources of information that may be presented within the vehicle. Completed tasks include reports on "Functional Requirements Specification for an In-Vehicle Information System," "In-Vehicle Information System Concepts," "Cost of In-Vehicle Information Systems and Associated Infrastructure," and "In-Vehicle Information Communication Protocol." A platform is being developed to operationally test new in-vehicle devices which can include routing and navigation, real-time traffic, motorist services, and collision avoidance subsystem. Four workshops have been held.

GENERATION 0 FIELD OPERATIONAL TEST - FREIGHTLINER CORPORATION

Description:

This is one of four field operational tests conducted under the Intelligent Vehicle Initiative program involving the use of crash avoidance technologies.

This project involves Roll Stability Advisor (RSA), an in-cab device that will indicate to a truck driver what the rollover threshold of the combination is, and how close to that threshold the driver is driving at any particular time. It is meant to provide feedback to the driver that will allow him or her to adjust his or her driving to a safer level. Six new Freightliner tractors coupled to tanker semi-trailers manufactured and owned by Praxair will be equipped with the RSA and used in test. The six combinations will operate as married units throughout the tests.

Praxair, a supplier of industrial gases, will serve as the fleet operator. The University of Michigan Transportation Research Institute will perform data collection and analysis, and with Freightliner, will instrument the trucks. Meritor Wabco will integrate the system into existing production electronics. Road User Research will conduct coordination activities. Aurora Exhibits will perform outreach activities.

Project Location:

LaPorte, Indiana

Partner(s):

Description:

This is the fourth task in a five-year Indefinite Quantity Contract (IQC) designed to support the research needs of NHTSA in the crash avoidance areas pertaining to communications, electronic controls, and computers. The objective of this task was to conduct an extensive analysis of the performance of current and developing in-vehicle data busses to support a variety of automotive safety systems using discrete event simulation software tools and to study and report on the current development of infrastructure and inter-vehicular communications protocols and implementations that affect performance of future safety systems.

DEVELOP AN ANALYTICAL MODELING FRAMEWORK/COLLISION AVOIDANCE SYSTEM

Description:

This project is the first task of an Indefinite Quantity Contract (IQC) titled "Crash Avoidance Research Technology Support - Simulation Models." The objective of this task was the development of an analytical framework that can be used to combine a number of ITS program features. The framework provided a means for assessing the safety impact of collision avoidance concepts and systems.

DIRECT PSYCHOPHYSIOLOGICAL MONITORING OF DRIVER ALERTNESS

Description:

This Small Business Innovative Research (SBIR) project developed a low cost device for direct monitoring of eye activity as an indicator of driver alertness. The device, Personal Alertness Monitor (PAM), is able to function as a stand alone alertness monitor. PAM also has the capability to work cooperatively with driver performance monitoring systems, as a component of a more complex system that includes continuous measure of driver performance, and with an integrated protocol for the presentation of warning signals. Phase I of the project is complete and resulted in a working prototype.

Project Location:

Chelmsford, Massachusetts

Contractor(s):

DRIVER STATUS/PERFORMANCE MONITORING

Description:

Cooperative Agreement leading to the development of detection algorithms and alerting mechanisms for a vehicle-based drowsy driver detection/warning system, countermeasures that will monitor driver status/performance and detect degraded performance to provide a warning signal or other countermeasure to prevent its continuance. The program developed vehicle-based detection algorithms for reduced driver performance (e.g., symptomatic of drowsiness/fatigue) and test candidate driver interfaces (i.e., advisories and alerting stimuli). These results provide the basis for the development of an on-road prototype.

Project Location:

Blacksburg, Virginia

HEAVY VEHICLE INTELLIGENT DYNAMIC STABILITY ENHANCEMENT SYSTEMS

Description:

The purpose of this project was to develop stability-enhancing systems for heavy trucks to reduce the incidence of vehicle rollover. The first product was a rollover warning system to be developed for a typical tractor-trailer, and will display to the driver how close to the rollover threshold the vehicle is being operated. The second product was a rearward amplification suppression system for multiple-trailer trucks. This system applied individual brakes on the vehicle to improve the stability and prevent trailer rollovers during vehicle maneuvers that typically excite the trailers in lateral acceleration.

HUMAN FACTORS DESIGN OF AUTOMATED HIGHWAY SYSTEMS

Description:

Guidance on human factors issues is of critical importance to Automated Highway Systems (AHS) planners and designers. This research effort provided timely human factors input during the conceptual stages of AHS development to aid in the design and implementation of the 1997 demonstration as well as provided the foundation for the future advancement of AHS objectives.

This project included both analytic and empirical tasks. In the early portion of the project, first generation AHS scenarios, including descriptions of AHS operations, objectives, and performance requirements, were developed. These scenarios were used as the basis for analytic and empirical research investigations addressing broad AHS human factors issues. In an iterative process, data from these efforts was used to refine and revise the scenarios. The refined scenarios formed the basis for a second set of empirical research investigations, addressing more detailed, system-specific AHS human factors issues. The culmination of these efforts was an AHS Human Factors Handbook for AHS Designers and Driver-based AHS Human Factors System and Development Guidelines.

HUMAN FACTORS IN ATIS AND CVO DESIGN EVOLUTION

Description:

The objective of this contract was to develop precise and detailed human factors guidelines for in-vehicle Advanced Traffic Information Systems (ATIS) for both private and commercial ITS applications. The effort consisted of three phases: analytic, empirical, and integrative. The analytic phase was accomplished by examining in-vehicle driver and CVO operator requirements and human factors issues within the context of in-vehicle routing and navigation systems, motorist information services, safety advisory and warning systems, and in-vehicle signing systems. Results were documented in publications that addressed current literature, ATIS/CVO performance requirement, ATIS and CVO functional descriptions and task analysis, and comparable systems analysis and alternative systems. The empirical phase used a systematic approach to select 11 issues to study from a list of 91 candidates issues developed from the analytic phase. Research issues considered to be most important and studied include: driver acceptance; the effects of inaccurate traffic information; transitioning between ATIS functions; fatigue; driver workload; the benefits of multimodal displays; driver response to unexpected situations; the effects of reduced visibility conditions and the effects of safety and warning systems on driver behavior. These experiments are being described in FHWA publications. The product of the integrative phase consists of the final version of the guideline document containing 75 guidelines. This guideline document represents the culmination of the work accomplished in all three phases.

IN-VEHICLE SAFETY ADVISORY AND WARNING SYSTEMS (IVSAWS)

Description:

The In-Vehicle Safety Advisory and Warning System is a Federal Highway Administration program to develop a nationwide vehicle information system that provides drivers with advance, supplemental notification of dangerous road conditions using electronic warning zones with precise areas of coverage. Extensive market investigation with the public and safety professionals revealed that while they both liked the IVSAWS concept, safety professionals wanted maximum compatibility with existing procedures, and motorists were concerned with avoiding false alarms. The operational concept selected uses centralized broadcasts from a regional IVSAWS operations center. Systems design analysis showed that an electronic warning zone with a specific area of coverage is the proper means to guarantee relevant alerts. Furthermore, a geolocation capability is the cost-effective means for implementing these electronic warning zones. Two candidates were selected which are compatible with centralized broadcasts and available geolocation systems.

PRELIMINARY HUMAN FACTORS REVIEW OF INTELLIGENT VEHICLE INITIATIVE (IVI)

Description:

The objective of this activity was to establish the human factors research needs for the near-term intelligent vehicles in the Intelligent Vehicle Initiative (IVI). This project included the solicitation of input from stakeholders and researchers, and consensus building for the design of human-centered IVI vehicles. In this study, preliminary infrastructure and in-vehicle architecture requirements for IVI Generation 1, 2, and 3 vehicles (with emphasis on Generation 1) were identified and analyzed. This analysis primarily included the needs for passenger cars, and to a lesser extent the needs for trucks, buses, and emergency/special vehicles. Twenty-six User Services were grouped into seven technology modules which were combined to create five candidate configurations for IVI vehicles. The requirements for infrastructure, vehicle, and human factors research for each candidate configuration were documented. A final report and six flyers were generated and are currently available through HRDS.

PROBLEM DEFINITION AND ANALYSIS OF TARGET CRASHES AND ITS COUNTERMEASURE ACTIONS

Description:

An analytical methodology for defining, analyzing, and modeling target crashes and ITS/crash avoidance countermeasure action for use in establishing research priorities and/or assessing potential safety benefits. This project has developed an analytical methodology for defining, analyzing, and modeling target crashes and ITS/crash avoidance countermeasure action for the purpose of assessing potential effectiveness and identifying R&D priorities and/or assessing potential safety benefits. The methodology has been applied to several types of collision. These findings will help the U.S. DOT to prioritize and guide research and development on these countermeasures.

VII. EVALUATION/PROGRAM ASSESSMENT

VII. EVALUATION/PROGRAM ASSESSMENT

Program evaluation is critical to ensuring progress toward the vision of integrated intelligent transportation systems and achieving deployment goals. Evaluation is indispensable to an understanding of the value, effectiveness and impacts of ITS Program activities. Equally important, evaluation allows for continual refinement of the Program. The ITS Program has undertaken assessment activities to satisfy these needs, and to use the Government Performance and Results Act to help ensure that the Program is effective in meeting the Government's higher-level transportation goals. To further these objectives, the following are included in activities that have been undertaken:

- Tracking ITS infrastructure by establishing a baseline of existing ITS deployments throughout the nation's metropolitan areas and updating this information *annually*.
- Evaluating the effectiveness and benefits versus costs of ITS infrastructure at the metropolitan and CVISN model deployment sites, as well as at field operational test sites to include Intermodal Freight field operational tests initiated in FY 99.
- Conducting independent evaluations (also referred to as national evaluations) of selected ITS deployment and/or integration projects undertaken with earmarked funding.

Evaluation. The most effective ITS evaluation activities are those that are intertwined with ITS projects throughout their life cycle. A principal benefit of evaluation is early participation of independent evaluators with project teams to ensure clear identification of the project goals and objectives, standards for successful performance, and measures of effectiveness agreed to by the project partners or project teams. Because evaluation is inherent to successful performance of any program, evaluation efforts (e.g., as part of research and development, field operational tests, mainstreaming, and architecture and standards work) are included as part of other sections of this projects report. Projects listed in this section are those that concentrate upon evaluations, or improving evaluation methods. With the selection of the four Metropolitan ITS Model Deployment sites and the initiation of the eight-state CVISN Pilot Projects, special emphasis is being placed on the evaluation of these projects by the ITS Joint Program Office (JPO). Moreover, future field operational tests will be evaluated by the ITS JPO. These evaluations are being provided through two parallel ITS Program Assessment Support (IPAS) contracts.

Program Assessment. Program assessment takes a global look at the U.S. ITS Program. Projects listed in this section of the ITS projects report focus on methods of integrating evaluation results to assess higher level program goals and objectives. Program assessment ultimately leads to investment strategies that must take an integrated look at program cost and effectiveness so that resources can be allocated to address the best solution approaches. Other projects listed in this section address methods for measuring ITS costs and benefits. The ITS Deployment Tracking Projects are the key activities dedicated to defining and tracking infrastructure deployment and integration to enable measurement of progress toward the Secretary of Transportation's deployment goals.

Finally, the Evaluation/Assessment Program results in a significant volume of reports which document the impacts and benefits of ITS at deployment and operational test sites. The ITS JPO Program Assessment activity is engaged in refining and transforming technical documentation into a stream of summary and more extensive reports for easy assimilation by decision-makers, planners, and implementers at the state and local levels of government and their private sector partners.

Research

ADVANCED PUBLIC TRANSPORTATION SYSTEMS (APTS) OPERATIONAL TEST EVALUATIONS

Description:

Project evaluation is the link between operational tests and technology transfer from the APTS Program. It serves as the bridge between the conduct of a particular operational test and understanding the actual performance at the site, as well as potential effectiveness at other locales. Specific objectives for each test are identified along with measures of effectiveness to communicate results to all interested professionals. Key issues are being evaluated ranging from the reliability of particular new technologies in transit applications to the effectiveness of new service and management methods made possible by the technologies. Crosscutting studies will develop a national set of insights across different site conditions.

ITS PROGRAM ASSESSMENT SUPPORT (IPAS)

Description:

These are support contracts intended to provide ITS program assessment technical and program support in the following areas:

- (1) Design, manage, implement, and support independent evaluations (also called national evaluations) of the effectiveness of ITS projects, including Metropolitan and CVISN Model Deployments, and other ITS projects to include deployment and/or integration projects undertaken with earmarked funding. This activity also encompasses evaluation of Intermodal Freight field operational tests.
- (2) Collect and analyze ITS performance, benefits, cost, economic, and program data. Data and information collected can be used to identify benefit/costs of ITS projects to support inclusion of ITS technology in state and local transportation problem solving.
- (3) Synthesize the information produced in (2); evaluate the degree to which ITS policies and procedures have led to the achievement of current ITS costs, schedule, and performance goals; and provide yearly quantitative and qualitative inputs to the refinement of goals and the resultant Federal ITS investment strategy.
- (4) Develop and refine the tools and information needed to support the JPO Program assessment and decision-making process.

Project Location:

Washington, DC; (4) Metropolitan Model Deployment Sites; (10) State CVISN Pilot And Prototype Model Deployments

Contractor(s):

ITS USER ACCEPTANCE RESEARCH

Description:

This program examines two aspects of user acceptance of ITS products and services. 1) The ITS Joint Program Office is conducting primary research to measure end-users' acceptance and willingness to pay for ITS user services. The program goal is to identify obstacles to and opportunities for encouraging broader ITS deployment. User groups include operators of commercial vehicles, private travelers, and public sector transportation managers. 2) Examining the evolution of the ITS consumer market, this user acceptance research project provides periodic reports on the market for traffic and traveler information products and services.

Completed reports (in chronological order) include "Critical Issues Relating to Acceptance of Commercial Vehicle Operations Services by Interstate Truck and Bus Drivers," May, 1995, Penn & Schoen Assoc.; "User Acceptance of ATIS Products and Services: A briefing book on the current status of JPO research," March, 1996, Charles River Assoc.; "ITS User Acceptance on Public Sector Transportation Managers: A Summary of Current ITI Deployment Knowledge," March, 1996, John A. Volpe National Transportation Systems Center; "An Update of the Commercial ATIS Market," March, 1996, and January, 1997, Volpe Center; "User Acceptance of ATIS Products and Services: What do we currently know?" October, 1996, Charles River Assoc.; "Acceptance of ATIS Products and Services: A report of qualitative research," December, 1996, Charles River Assoc.; "An Assessment of the ITS Commercial Trucking Market," February, 1997, Volpe Center, "Marketing ITS Infrastructure in the Public Interest," May 1998.

Research conducted in fiscal year 1999 addressed market demand of private travelers for in-vehicle crash avoidance countermeasures and advanced traveler information services.

METROPOLITAN ITS INFRASTRUCTURE DEPLOYMENT TRACKING

Description:

The purpose of this project is to provide the ITS Joint Program Office feedback on achieving the US DOT Operation TimeSaver goal. This goal is to deploy a metropolitan ITS infrastructure nationwide by December 2005. The project uses a three-step process: 1) Define major indicators of both component and integration deployment; 2) Periodically measure the presence of these indicators at 78 of the nation's largest metropolitan areas compared to the opportunity for deployment; and, 3) Work with partners at these sites to ascertain deployment goals and report back deployment against these goals. This approach acknowledges that ITS must be tailored to individual needs within each metropolitan area and that such needs are determined in a cooperative working environment among Federal, State, and local government participants. To date, there has been much progress in defining a set of indicators and obtaining a baseline measurement of these indicators. Analysis and quality review of the baseline data was performed in FY 1998 to ensure the reliability and validity of the data and the indicator definitions. As a result of this work, a FY 1997 baseline was established and published. Work on a FY 1999 update to the database is nearing completion. This effort will include provision for gathering information on local deployment goals.

EVALUATION SUPPORT FOR ITS OPERATIONAL TESTS

Description:

This was a support contract intended to provide technical support to FHWA headquarters and field offices as well as the operational test partners in designing and conducting operational test evaluations. The intent was to ensure the evaluations of the operational tests supported the national ITS program. The level of support varied from test to test depending on need and ranged from the review of draft plans and reports to the actual development of these plans and reports in some cases.

ITS BENEFITS ASSESSMENT FRAMEWORK

Description:

This project developed an analytical framework for assessing the benefits achievable from the deployment of ITS technologies and strategies. The framework utilizes existing computer models for estimating potential changes in congestion, vehicle emissions, energy consumption, safety and other values. Although the framework is intended to encompass most ITS technologies, this project was primarily concentrated on Advanced Traffic Management Systems (ATMS), Advanced Traveler Information Systems (ATIS), and interacting Advanced Public Transit Systems (APTS). Planning models were used to assess both short- and long-term impacts of proposed ITS deployments. The product of this effort is a set of interrelated models for estimating the impacts of specific ITS deployment alternatives. Network and corridor case studies were produced using existing operational tests and corridor projects for which data exists.

ITS NATIONAL INVESTMENT AND MARKET ANALYSIS

Description:

The ITS National Investment and Market Analysis provided public agencies, private companies, and legislatures with an understanding of the scope, cost, and resulting benefits and opportunities expected to emerge as a result of realizing the national goals of fully deploying Intelligent Transportation Systems in the United States. Results of this study also will be used to inform discussions and hearings on the Intermodal Surface Transportation Efficiency Act (ISTEA) reauthorization and the Federal FY98 budget in early 1997.

This study supplemented existing and ongoing research to provide following answers.

- * Quantify the public investment in the infrastructure required to satisfy national goal for ITS deployment.
- * Explore the willingness of the private sector to invest in ITS based upon the expected public infrastructure deployment.
- * Link the benefits received to the cost required to deploy the infrastructure.
- * Determine the impact on the general economy of full investment in ITS technology.
- * Summarize the findings of the research to present a picture of the possibilities for, and impact of, deploying Intelligent Transportation Systems into the next decade.

Project Location:

ITS America, Washington, DC

Partner(s):

ITS America is working in cooperation with the U.S. Department of Transportation's Joint Program Office to complete this analysis. Apogee Research, Inc., is the prime contractor with support from Wilbur Smith, and a team of advisors.

A steering committee and technical advisory committee comprised of other ITS stakeholder organizations advised the scope and direction of this effort.

ITS OPERATIONAL TEST META-EVALUATION

Description:

Although ITS operational tests include evaluations as an integral part, these evaluations are specific to the individual operational tests. To address national ITS program information needs, particularly those related to deployment decisions, additional information based on the comparison and analysis of inputs from all available information sources, including R&D, operational test results, and architecture efforts, is required. This project has provided meta-evaluation methodologies and applied those methodologies to address key questions of interest to FHWA in administering the national ITS program. Four studies have been conducted as part of this project. The various statistical approaches for the meta-evaluation of ITS user services were identified in a paper titled, "A Data Fusion Framework for Meta-evaluation of ITS System Effectiveness. A second study focused on the role of the incident detection component of freeway management systems and its role in the reduction of fatalities. This study was titled, "The Impact of Rapid Incident Detection on Freeway Accident Fatalities." In the third study, titled, "Reducing Accident Fatalities with Rural MAYDAY Systems," the impact of rural MAYDAY systems on rural roadway fatalities was examined. In the final study, titled "The Impact on Fatal Involvements of CVO User Services" the role of ITS CVO technologies in reducing fatal accidents involving commercial vehicles was examined.

MEASURING USER RESPONSE AT OPERATIONAL TESTS

Description:

This effort had two parts: A seminar entitled "Applying Consumer Research Methods to ITS Challenges" and a guidebook to collecting and analyzing user response and market acceptance data. The project was undertaken primarily to support the evaluation of field operational tests, but had applicability to other deployment-oriented ITS programs such as the Early Deployment and Priority Corridors Programs. The seminar and guide provided an analytical framework to assist program managers and evaluators in defining critical user acceptance research objectives, structuring a suitable experimental design, and selecting appropriate research tools.

The Volpe National Transportation Systems Center produced the seminar "Applying Consumer Research Methods to ITS Challenges" on April 12-13, 1995, in Boston, MA. The guidebook was available in early 1997.

VIII. ARCHITECTURE, STANDARDS, AND NATIONAL COMPATIBILITY PLANNING

VIII. ARCHITECTURE, STANDARDS, AND NATIONAL COMPATIBILITY PLANNING

National ITS Architecture Development and Deployment. In July 1996, the Architecture Team completed development of the National ITS Architecture. This effort has provided the supporting analysis, implementation strategy, and detailed requirements essential to accelerate the ITS standards development process. The National ITS Architecture, in conjunction with the developed standards, will supply the transportation and communications framework necessary for a nationally compatible intelligent transportation system.

The architecture program has responded to stakeholder needs articulated in user services. It has identified interfaces between the system components, recommended the message sets and data that would be exchanged and that would need standards development, and has provided an implementation strategy for use by public and private sector transportation planners in developing their unique ITS systems. A thirty-first user service, archived data, was identified as a validated need by the highway planning community and integrated into the National ITS Architecture in September 1999. In 1999, emerging rural needs have been raised, with operations/maintenance and weather both considered candidates as new user services in the near future. Thus, the architecture will continue to be updated and maintained based upon evolving standards, deployment experiences, and stakeholder consensus for additional user services.

With the architecture development essentially complete, the program focus has turned to ITS deployment support. A new initiative has begun in 1999 with the design of two levels of workshops to support regions and MPOs in the development of their regional and project architectures. A software tool, Turbo Architecture, is currently under development and expected to be used by MPOs and regions next year in this effort while using the National ITS Architecture as a reference. These workshops and their subsequent architectures should foster standardization and compatibility between projects and regions.

A continuing architecture effort has been the support of the Standards Development Organizations. The Architecture Team has been working with them in clarifying ITS standards requirements identified in the architecture, but more recently has been facilitating the effort to accelerate the development and approval of national standards.

Finally, an interactive architecture training course continues to be conducted with nearly 100 presentations given throughout the country to more than 2000 transportation professionals. In addition, education and technical assistance to the public and private sector from FHWA, with the use of the architecture development team, is being conducted to aid in the total ITS planning and deployment process. Understanding the broad foundation provided by the National ITS Architecture is leading to an acceleration of ITS deployment nationwide, bringing us closer to the vision set by ISTEA and providing momentum for the implementation addressed in TEA-21.

ITS Standards Program. U.S. DOT is carrying out a multi-year ITS standards program designed to accelerate the development and promote the widespread deployment of integrated ITS systems through robust, non-proprietary standards. Together with standards development organizations and other ITS stakeholders, the ITS Standards Program encompasses standards development, testing,

outreach and education, technical assistance, and policy support. Information on the standards program and on the standards can be found on the standards Web site, www.its.dot.gov/standard/standard.htm.

- **Standards Development.** The U.S. DOT is committed to the accelerated development of ITS standards in cooperation with existing standards development organizations (SDOs). The SDOs develop ITS standards through a consensus-based volunteer process. Currently, activities are underway leading to the development of about 100 ITS standards that address communications interfaces in the National ITS Architecture. As the National ITS Architecture continues to expand into such areas as intelligent vehicles, data services, emergency services, and rural ITS applications, the need for additional ITS standards will be identified.
- **Standards Testing.** A comprehensive program has begun to test ITS standards that are emerging from the standards development process. The primary purposes of the ITS standards testing program are to investigate the operation, correctness, and completeness of the standards and to “prove” the standards in realistic settings. As an important measure to encourage acceptance and use of ITS standards, testing will provide timely and meaningful information on standards readiness to the ITS community. The testing program will leverage ongoing and planned ITS field deployments. Where necessary, laboratory simulation testing or testing in a special-purpose “test bed” may also be performed.
- **Standards Outreach and Education.** To promote the awareness and use of ITS standards, the ITS Standards Program includes a multi-faceted outreach and education program for public- and private-sector stakeholders involved in ITS deployment. The program includes non-technical outreach, technical outreach, and training and education.

Non-technical outreach is aimed at communicating the rationale and benefits for using ITS standards to transportation stakeholders. This outreach also will keep stakeholders aware of the ITS Standards Program and related policy activities.

Technical outreach will educate the community on the content of standards, the status of their availability, the application of specific standards, and issues related to standards implementation. Outreach products include resource materials, such as fact sheets, user guides, and sample procurement specifications to assist users with standards-related deployments. Case studies and reports on “lessons learned” will be developed and disseminated to provide essential information needed by stakeholders and to build confidence in the standards.

Finally, instructional training on ITS standards will be conducted through updated courses, new courses, workshops, and other formats, as appropriate.

- **Standards Technical Assistance.** To assist public-sector agencies with ITS standards-related deployments, the U.S. DOT will provide technical support, including in-depth assistance with the detailed mechanics of the standards. The U.S. DOT will target assistance in areas directly related to standards implementation, such as system planning, design, procurement, installation, and product and system acceptance. In addition to its own staff resources, the U.S. DOT will

utilize its Peer-to-Peer Program for technical assistance on ITS standards. The Peer-to-Peer Program provides on-demand support through an established network of experts.

- **Standards Policy Support.** The Transportation Efficiency Act for the 21st Century (TEA-21) establishes two distinct areas of policy support: critical ITS standards and conformity to ITS standards. Critical standards are those that enable national interoperability or apply to the development of other standards. Conformity to standards applies to all standards and becomes important when a standard is formally adopted by U.S. DOT. Only after a standard has completed sufficient evaluation and testing will U.S. DOT consider it for adoption, a process that begins with a "Notice of Proposed Rulemaking."

Research

ELECTROMAGNETIC COMPATIBILITY TESTING FOR ITS

Description:

A resource has been established to conduct evaluations of the electromagnetic compatibility of various proposed ITS communications components, operating singly and in combination. Many of the issues which were investigated were drawn from the ITS System Architecture development effort. Sophisticated simulations, anechoic chambers, and antenna test ranges were employed to perform this testing.

INTELLIGENT TRANSPORTATION SYSTEMS (ITS) SPATIAL DATA INTEROPERABILITY

Description:

Intelligent Transportation Systems (ITS) applications will require communication of locationally-referenced information. Location referencing methods such as linear, link, address, and coordinate based methods have been applied historically to limited geographic, functional, or organizational domains with homogeneous databases. ITS applications will be implemented over large domains, and will require location referencing in real time over communications links between dissimilar databases at central sites, at home or office, within travelway infrastructure, and in vehicles.

By far the dominant requirements for location referencing are from those applications requiring vehicle tracking or location reporting, link travel time updates or other real-time information to vehicle navigation systems, and particular implementations assuming central-site generation of routes. This project will address these issues and accomplish the following:

- * With the aid of the communities of interest involved, develop the specification of an appropriate and flexible interoperability protocol for ITS, based on the concept of the location reference message protocol (LRMS).
- * Develop the specification for the ITS Datum, a database of ground control points, including a prototype national Datum for testing and evaluation process.
- * Support appropriate standardization organizations to produce a national and international location referencing standard for ITS.
- * Support a prototype testbed for the validation and verification of the LRMS and ITS Datum concepts in a realistic operation setting.
- * Develop a testbed for the LRMS and the ITS Datum on the World Wide Web - for the testing of user compliance with regard to standards.
- * Establish strategies and processes for implementing and maintaining the LRMS and ITS Datum, and users' manuals and aids.

INTELLIGENT TRANSPORTATION SYSTEM STANDARDS PROGRAM

Description:

In support of the goal of widespread use and evaluation of technologies for intelligent transportation systems (ITS), the specific objectives of the ITS Standards Program are:

- To promote the ability of public sector transportation agencies (and others) to choose from multiple vendors' ITS products and services. By fostering a competitive marketplace based upon open system standards, agencies will not be locked into proprietary systems from a single vendor, who may have little incentive to reduce costs or improve products and services. With open standards, agencies can choose from among multiple vendors and competing systems, resulting in lower cost and higher quality products and services.
- To promote the creation of an innovative ITS market. Non-proprietary, open system standards lower the risk for new companies to enter the marketplace by removing barriers to market entry and by enabling innovative solutions. Because standards-compliant products and services are assured to be compatible technically with other standardized systems, design of new products and the introduction of new technologies is easier than if each element of a new system has to be custom designed. This makes the development and testing of new products and services more rapid and cost effective.
- To facilitate interoperability at agency, jurisdictional, state and national levels. Standards enable common understanding and use of information and will promote coordination among ITS providers and users. Standards-compliant products and services will have a built-in level of interoperability.
- To ensure the safety of the traveling public. Human factor and operational guideline standards will ensure that ITS products and services will be used safely. Standardized ITS systems will reduce congestion, provide more and clearer information to travelers, and will reduce incident response times, all of which lead to safer travel conditions.
- To facilitate the deployment of ITS technologies. Standards will drive efforts towards deploying integrated systems because agencies will be able to reference appropriate standards in procurement packages.
- To support test and evaluation of standards, including coordination of deployment projects.
- To promote international competitiveness of U.S. industry. The standards program will ensure that strong and substantiated positions will be forwarded to the international standards community for the development of international standards. Having international standards based upon U.S. standards will facilitate U.S. industrial competitiveness because U.S. companies will already have the required standards technologies and experience.

ITS standards include (1) protocols for communications, such as dedicated short-range communications between vehicles and roadside transponders, (2) message sets that specify the form and content of information transmitted among the various elements of the ITS system, (3) safety and human factor standards associated with the introduction of new ITS capabilities and devices, and (4) foundation standards that provide for uniformity across ITS applications, such as "data dictionaries" that define terminology, data formats, and acceptable values for data and standards that specifying formats for location information.

The ITS Standards Program is composed of five elements: standards development, standards testing, standards outreach and education, standards technical assistance and standards policy support. The standards program initially focussed upon development of standards needed to standardize the information flows of the National ITS Architecture. Now that the planned standards development efforts are nearing completion with over 80 standards in development, in ballot, or approved and published, the standards program is adopting a strong emphasis on testing and interoperability, implementation activities (such as resource materials, outreach, education and training), and policy support activities.

The standards testing program will promote the integration and interoperability of ITS technologies and products and will build credibility of the standards and reassure deployers that the standards perform as intended. The purpose of standards testing is to investigate the completeness, correctness and interoperability of the standards and to "prove" the standards in realistic transportation settings under operational conditions. Through testing and widespread distribution of test results, ITS standards will "mature" more quickly, thereby leading to their earlier acceptance by ITS stakeholders.

Standards outreach and education activities are aimed at ensuring that all public transportation stakeholders and those in the private sector who are involved in ITS implementation are aware of ITS standards and the educational and training opportunities that will help them become knowledgeable about the scope and use of these standards. The intent of these activities is to provide stakeholders useful information and materials that will help them to become aware of and familiar with ITS standards and to understand the applicability of the standards for their proposed systems. Standards outreach will provide transportation stakeholders involved in deploying ITS systems with useful materials and information, such as user guides and other documentation about the standards. Education and training includes workshops, classroom training and modules that can be inserted in existing courses and is intended for those who require more depth in understanding the standards and how they are used. It also includes extensive development of resource materials, documentation on ITS successes ("lessons learned" and case studies), and evaluation of the effectiveness of the outreach and education efforts.

Standards technical assistance includes providing technical information on the standards. The primary mechanism in this area is the U.S. DOT Peer-to-Peer Program, for which the standards program will enlist standards experts. Standards policy support activities involve guidance and direction in the steps that should be taken to meet the conformity requirements, as called out in TEA-21, relating to the National ITS Architecture and standards.

NATIONAL ARCHITECTURE DEPLOYMENT SUPPORT

Description:

A consensus national architecture has been developed to serve as the framework for Intelligent Transportation System's deployment. U.S. DOT has recognized the need for several follow-on tasks to be accomplished to maximize the return on this investment. The first is to maintain the architecture in a current status, incorporating input from deployment programs throughout the country as well as from emerging ITS standards. It is available on the World Wide Web and on CD ROM for the broadest and most user friendly distribution. Version 3.0 of the CD ROM, incorporating the new archived data user service and other changes, was available for distribution in December 1999. The next version will likely incorporate a new user service, operations and maintenance, as well as a focus on rural needs and updates in other areas of the architecture. It will thus continue to be the definitive and accurate reference for ITS deployment planning.

The second task is ITS deployment. Two levels of workshops were initiated in late 1999 – tier 1 and tier 2 – to support Metropolitan Planning Organization/Statewide development of regional and project architectures. A software tool, Turbo Architecture, is under development and will facilitate the process using the National ITS Architecture as a reference. In addition, the Architecture Team will continue to meet with public and private sector personnel across the transportation spectrum and assist in defining and explaining the National ITS Architecture and its benefits to users.

The third task is to train transportation professionals, both public and private sector, in using the National ITS Architecture. Nearly 100 presentations to more than 2000 persons have been conducted throughout the country through 1999 with another 25 presentations scheduled in 2000. Finally, the Architecture Team will continue working with the Standards Development Organizations (SDOs) to assist in accelerating standards development, testing, and approval. This involves continuing their active participation with SDO committees and subcommittees in varying standards efforts.

Completed Projects

AUGMENTATION FOR GPS

Description:

This project was a three phase effort that supported and facilitated the development of a nationwide GPS Augmentation infrastructure to provide the basic positioning system for the public safety aspects of ITS. Phase I analyzed the ability of available GPS Augmentation systems to meet user requirements. Recommendations for the most effective GPS Augmentation services were developed. Phase II was an-depth analysis of the characteristics of the systems recommended under Phase I to determine if there were any technical issues that needed resolution. This included interference analysis, development of a system concept, and a tradeoff analysis of various technical parameters. Phase III was a study of the institutional and policy issues that needed to be resolved upon implementation of the recommended GPS Augmentation system. Examples of these issues included liability in case of degraded system performance, and the impact on the user community, service providers and the commercial electronics industry as a whole. Several scenarios were examined including a privately installed, operated and maintained system, a publicly installed, operated and maintained system and various combinations of these two.

ITS COMMUNICATIONS ALTERNATIVES TEST AND EVALUATION

Description:

Investigations into communications technologies and issues associated with ITS systems were conducted. Activities were focused upon identifying and analyzing particular communications technologies, which included wireless and wireline, for ITS functions. Investigations also included communications protocol issues. Preferred communications alternatives were recommended for specific ITS functions. Finally, a technical analysis of required quantity and location of spectrum was completed.

NATIONAL ARCHITECTURE DEVELOPMENT

Description:

The National ITS Architecture has been developed to guide, not mandate, consistency among investors, purchasers, producers, and users in order to reduce the risk of incompatibility among the numerous intelligent transportation systems components to be manufactured and purchased in this industry. Phase I of the architecture development involved four industry teams, each producing an open national ITS architecture that provided the full set of ITS services (as defined in the National ITS Program Plan) while meeting critical ITS goals and objectives. In Phase II of the architecture development, two of the four teams were selected to resolve differences and develop the final national ITS architecture in an open, non-competitive process that allowed for outside input. Phase II has been completed and the single National ITS Architecture produced and documented. An additional user service, highway rail intersection (HRI), has been identified and was incorporated into the National ITS Architecture in January 1997.

The architecture development program, to include the HRI user service, has yielded a comprehensive set of standards requirements that have been forwarded to the ITS Standards Program Office and ITS-contracted Standards Development Organizations in order to accelerate ITS standards development.

SYSTEM ARCHITECTURE CONSENSUS BUILDING AND OUTREACH

Description:

This project was the outreach arm of the effort to develop and analyze a system architecture and deployment strategy, to provide the foundation for nationally interoperable ITS.

Understanding the diverse needs of the many and varied ITS stakeholders was a prerequisite for successful development of an architecture that met the requirements laid out by the set of ITS User Services, as described in the National ITS Program Plan. The DOT and the contractors on this effort have been, and will continue to, work cooperatively to gauge and foster consensus on a nationwide deployment scenario for ITS, as advocated by the architecture development program. The partnership of contractors and DOT is referred to as the Consensus Building and Outreach Team.

Services provided under this contract included: working with DOT and architecture development contractors to develop material appropriate for outreach; arranging and facilitating task force and focus group meetings to discuss architecture, standards, and deployment issues identified by the architecture development program; coordination with the various State and Regional ITS Chapters to encourage their involvement in the process of determining stakeholders' concerns; and all general planning, advisory, and coordination support needed to accomplish the objectives of the consensus-building effort, namely: (1) to maximize responsiveness to concerned stakeholder groups; (2) to maximize coverage of the country; and (3) to schedule and execute activities in a timely manner to aid the architecture development contractors in producing each successive refinement of their products.

Project Location:

Washington, DC

Contractor(s):

Part of this effort has been incorporated as part of the ITS America cooperative agreement. Other pieces of the program will be executed as separately funded task orders with ITS America, TRESP & Associates, and others during the course of the program.

Start Date:

October 1992

End Date:

July 1996

IX. MAINSTREAMING

IX. MAINSTREAMING

The strategy for deployment of ITS emphasizes “mainstreaming” in the planning process, educating, training, providing technical assistance, and achieving “buy in” and application at the state and local levels.

A. Deployment Planning

The existing planning and programming process for transportation improvements is well-established, and includes procedures for considering an area’s long-range needs, environmental issues, and creation of a specific program of projects for funding. In order to contribute to transportation improvements, ITS solutions must become part of the set of alternatives being considered. U.S. DOT has 90 early deployment planning studies completed or underway. Merging ITS into the planning process and offering innovative ways for state and local governments to acquire ITS solutions is critical to the success of the ITS program.

B. Deployment Support

The deployment support objectives include: (1) bringing together, in a series of workshops, public and private sector professionals to discuss practical solutions to problems which may be encountered in the deployment of ITS; (2) providing technical assistance through information exchange in peer-to-peer workshops and through technology transfer; and (3) identifying and carrying out activities needed to effectively promote ITS in the state and metropolitan planning processes, to educate the ITS community as to how those processes work, and to educate those involved in regional planning regarding ITS.

C. Professional Capacity Building (PCB)

In order to support the deployment of ITS, it is imperative that the technical capacity of transportation professionals at a variety of institutional levels be expanded. Focusing initially on federal employees and engaging state and local professionals, the Professional Capacity Building program will support the national ITS program by:

- Increasing knowledge about ITS benefits and deployment options among decision makers;
- Expanding the technical skills and capabilities of public sector implementing and support agencies;
- Developing an education and training infrastructure at multiple levels, including colleges, universities, public agencies, and commercial providers.

Early Deployment Planning

AKRON, OHIO METROPOLITAN AREA EARLY DEPLOYMENT PLANNING STUDY

Description:

The Akron, Ohio area will focus its initial efforts on the feasibility of traffic management on the regional freeway and feeder systems. The central traffic control system and a roadside/roadway system will define the infrastructure necessary to support and influence the interaction of the various functional subsystems of ITS including an Advanced Traffic Management System, an Advanced Traveler Information System, the Commercial Vehicle Operations, and Advanced Public Transportation Systems.

BALTIMORE, MARYLAND EARLY DEPLOYMENT PLANNING STUDY

Description:

The Baltimore Metropolitan Council, in cooperation with Maryland State Highway Administration, is conducting an Early Deployment Project for Metropolitan Baltimore that will be done in two phases: (1) ITS User Services Plan and ITS Strategic Deployment Plan, and (2) a Detailed Implementation Plan including an initial deployment of one or more high priority user services. The Baltimore Metropolitan Area, which includes Baltimore City, and Anne Arundel, Baltimore, Carroll, Harford, and Howard Counties, accounts for about 50% of Maryland's total population, business establishments and economic activity.

Project Location:

ITS PROFESSIONAL CAPACITY BUILDING

Description:

The purpose of this program is to provide essential education and training programs for Federal, State and local agency professionals and for elected officials and the general public concerning the deployment of Intelligent Transportation Systems. The activities are multimodal and multilevel in nature, incorporating awareness programs, technical training, and education programs at the undergraduate and graduate levels. By the end of the year 2000, it is anticipated that as part of the first phase of this essential effort elected officials and the general public will understand the value and applications of ITS components, and that there will be sufficient numbers of trained U.S. DOT, State and local ITS professionals in place. It is also anticipated that additional trained professionals will be entering the work force and that comprehensive, multi-disciplinary programs will be in place.

The "Five Year Strategic Plan for Professional Capacity Building" was issued in 1996, to establish the basic objectives of the PCB Program. Since then a series of ten one-day seminars and ten short courses (of 2 to 3 days each) have been presented about 250 times to nearly 8,000 people. A comprehensive analysis of education and training needs resulted in the identification of more specialized technical training required to deploy ITS projects. That analysis also provided data for ideal staffing for agencies and projects, and the competencies required by those individuals. A set of distance learning pilots have been launched to provide more cost-effective, targeted, just-in-time delivery of training. A comprehensive curriculum has been established for education and training courses to guide the PCB Program.

NIAGARA INTERNATIONAL TRANSPORTATION TECHNOLOGY COALITION

Description:

Using a revolving loan fund to finance the NITTEC Program, the many agencies and jurisdictions which own and operate the Niagara River Border Crossings and the major approaches to those crossings will establish a multiagency transportation coordination and management council to:

- a) Develop regionally compatible travel information and traffic management strategies (e.g., non-stop electronic customs processing, ETTM);
- b) Establish a Regional Transportation Management Center to monitor regional traffic and coordinate traffic management strategies (e.g., incident management and tourist/travel information service); and
- c) Help finance operating and capital improvements by operating agencies to expedite the movement of traffic across and to the border.

CVO Deployment Support

ITS/CVO TECHNOLOGY TRUCK

Description:

The ITS/CVO technology truck project goal is to create a national demonstration project -- using an 18-wheeler designed and constructed to house portable ITS technology, classroom-type facilities, and informational kiosks -- in the area of CVO designed to demonstrate, educate, and inform state agencies and motor carrier communities regarding the technologies and potential benefits of the ITS/CVO program. The program will also serve as a method of introducing ITS/CVO technology to the secondary audiences -- motor carrier safety enforcement officers, motor vehicle operators (truck/bus drivers), transportation students and the general public by providing hands-on demonstrations as well as interactive, multi-media based informational presentations.

BIRMINGHAM, ALABAMA AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

The Alabama Department of Transportation developed an ITS/Congestion Management Program for the Birmingham metropolitan area. The consultant worked with a State-selected Oversight Committee comprised of State, City, County, and private sector personnel. The consultant identified levels of congestion on freeways and other highways of national significance recommending short-term and long-term measures and ITS strategies to alleviate congestion. The program described the needs, the applicable ITS user services, the functional requirements, the system architecture, implementation issues, the cost effectiveness, and the performance monitoring plan. As a result of this study, the State is developing plans for a computerized traffic signal upgrade, fiber optic cable communications, and camera surveillance/detection system. Also, freeway service patrols began in the first half of 1997.

Project Location:

Birmingham, Alabama

BUFFALO/NIAGARA FALLS, NEW YORK AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

The area's coordinated effort developed a strategic plan for area-wide deployment of Intelligent Transportation Systems (ITS). The study followed the FHWA's User Services/ITS Planning and Deployment Process. Key elements of the study included:

- * Establishing the coalition of key stakeholders;
- * Developing an area-wide Strategic Plan based on the area's unique user service needs;
- * Identifying key early implementation projects;
- * Developing a Phased Implementation Plan with timetable and funding availability;
- * Identifying/quantifying operations and maintenance resource needs;
- * Identifying needed institutional arrangements;
- * Establishing public outreach programs.

In order to keep the ITS design/deployment process moving as efficiently as possible, the consultant study contract was established with a mechanism to proceed directly into project design. In addition to the \$2 million earmark for deployment, New York State Department of Transportation has programmed more than \$10 million in its five year capital program for ITS activities for the Buffalo area. Early action projects for the area include establishment of an interim traffic management center, development and support of an incident management team, and deployment of portable changeable message signs and highway advisory radio.

CHARLOTTE, NORTH CAROLINA AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

The overall project for the Charlotte metropolitan area, titled "Congestion Avoidance and Reduction for Autos and Trucks", or CARAT, incorporated elements of Advanced Traffic Management Systems, Advanced Traveler Information Systems and Commercial Vehicle Operations for the greater Charlotte/Mecklenberg area. The project was implemented in phases. The phase I initiative consisted of the development and operation of a freeway management system for a 15.2-mile section of I-77. Subsequent phases of the project extended surveillance and control to a total of 360 miles of freeways in the Charlotte urban area.

The Early Deployment Planning study focused primarily on development of the functional specifications for the regional traffic management system.

The full project report described the fundamental system elements necessary to implement this regional traffic management system in the greater Charlotte area. Analyses of the alternative technologies and strategies were presented as a basis for the recommendations. Where appropriate, functional specifications were included for use in the preparation of final design documents.

CHICAGO, ILLINOIS AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

This feasibility and planning study developed and documented an integrated, multi-modal, areawide ITS multi-year strategic deployment plan for implementation of ITS user services and technologies incorporating and integrating the existing, extensively deployed, multi-modal ITS infrastructure within the Chicago metropolitan planning area. The plan recommended a list of projects for implementation, provided a staged implementation plan and identified potential public and private funding sources. The plan also maintained sufficient flexibility to incorporate emerging technologies. Although the study primarily addressed the freeway, expressway and tollway systems and the public transit systems, appropriate strategic regional arterials were also addressed. The IVHS Planning and Project Deployment Process was utilized and consistency was achieved with the National ITS Program Plan, Intelligent Transportation Infrastructure and national ITS architecture development process. The study was also closely integrated with the Gary-Chicago-Milwaukee (GCM) ITS Priority Corridor Initial and Updated Program Plans. The consultant (TransCore) for the study began work in early 1997.

A multi-modal Advanced Technology Task Force was established by CATS to oversee development and implementation of the strategic early deployment plan for northeastern Illinois. All tasks have been completed, including the following deployment action memoranda: Existing Transportation Systems, Problems and Opportunities, User Services Plan (includes 25 candidate actions), ITS-Related Activities in the Region, Alternative ITS Technologies, Regional ITS: Status and Perspectives, Immediate Deployment Action Plan (includes 4 immediate actions), Regional ITS Architecture, Strategy for Regional ITS Integration, Long Range Visions for ITS in Northeastern Illinois, Regional ITS Deployment Action Plan, Guidelines for Evaluation of SEDP and ITS Effectiveness, and Northeastern Illinois Strategic Early Deployment Plan for ITS (Final Report and Executive Summary).

Project Location:

CLEVELAND, OHIO AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

The purpose of this project was to develop a traffic surveillance and control system feasibility study for the Cleveland metropolitan area. The consultant prepared a Strategic Deployment Plan focusing on the freeway/expressway system and an Incident Management Plan. The Strategic Deployment Plan identified the user service requirements in the study region, the user service objectives based on these requirements, the functions required to support the user services, and defined the system architecture.

Project Location:

Cleveland, Ohio

Partner(s):

Ohio DOT

Start Date:

September 1993

End Date:

October 1996

**Estimated Total
ITS Funds:**

\$400,000

**Estimated Total
Project Cost:**

\$500,000

COLUMBUS, OHIO EARLY DEPLOYMENT PLANNING STUDY

Description:

The project was a feasibility study of an interface between traffic signal control systems and the freeway management system in Columbus, Ohio. These systems are currently operating independently. The Mid-Ohio Regional Planning Commission proposed to interface the systems in order to maximize efficiency of traffic operations in the Columbus area. The result of this study provided a working model of the interface between the systems.

Project Location:

Columbus, Ohio

Partner(s):

Ohio DOT and Mid-Ohio Regional Planning Commission (MORPC)

Start Date:

August 1995

End Date:

August 1997

**Estimated Total
ITS Funds:**

\$188,000

**Estimated Total
Project Cost:**

\$235,000

DALLAS, TEXAS AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

The purpose of the Dallas area-wide ITS plan was to improve mobility, safety, and productivity. The goals of the plan were to:

- * Coordinate with public and private sectors to collect and disseminate real-time information on traffic and transit conditions.
- * Optimize transportation system operations by coordinating operations among governmental agencies.
- * Encourage transit and High Occupancy Vehicle (HOV) usage.

These goals are being addressed through six objectives with specific tasks associated with each objective.

1. Establish a broadly-based Steering Committee with representatives from multiple agencies.
2. Assess the existing transportation management and communications linkages and investigate the potential application of ITS technologies.
3. Identify institutional and legal barriers to coordination and recommend solutions.
4. Produce an integrated, area-wide multi modal, multi-jurisdictional ITS plan while maintaining flexibility to incorporate emerging technologies.
5. Develop project evaluation criteria, costs and benefits, priorities, and staged implementation plan.
6. Define projects for implementation, prepare proposals, and identify private and public funding sources.

Project Location:

Dallas, Texas

Partner(s):

Texas DOT

Start Date:

September 1992

End Date:

October 1996

Estimated Total ITS Funds:

\$600,000

DENVER, COLORADO AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

This Early Deployment Planning Project developed an Intelligent Transportation Systems Strategic Plan for the Denver Metropolitan Area. The plan, covering the next 10 years, selects a smart corridor and provides a guide for the implementation and deployment of ITS technologies in this corridor, as well as throughout the metro area. Phase I was completed April 30, 1995. Phase II will be completed as part of the Denver, Colorado Preliminary Engineering Early Deployment Planning Study.

Project Location:

Denver, Colorado

Partner(s):

Colorado DOT

Start Date:

December 1991

End Date:

April 1993

**Estimated Total
ITS Funds:**

\$213,000

**Estimated Total
Project Cost:**

\$316,000

DENVER, COLORADO PRELIMINARY ENGINEERING EARLY DEPLOYMENT PLANNING STUDY

Description:

The Colorado DOT developed an Intelligent Transportation System Strategic Plan for the Denver Metropolitan Area. The plan provides a guideline for the implementation of ITS technologies during the next 10 years. One of the first recommendations was to develop and implement an Advanced Traffic Management System (ATMS) as the focal point for multi-agency and public/private sector traffic management and ITS activities. This early deployment planning project developed the preliminary design of the ATMS and the field elements that are needed to support the system's functions. The Colorado DOT (CDOT) is continuing with a follow on project to complete the design and implementation of the ATMS using a design/build procurement.

Project Location:

Denver, Colorado

Partner(s):

Colorado DOT

Start Date:

August 1992

End Date:

June 1997

**Estimated Total
ITS Funds:**

\$500,000

**Estimated Total
Project Cost:**

\$625,000

DETROIT, MICHIGAN AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

The Michigan Department of Transportation prepared a comprehensive deployment plan addressing the issues related to an upgrade and expansion of the existing 32.5-mile Advanced Traffic Management Systems (ATMS)/Advanced Traveler Information Systems (ATIS) (freeway surveillance) system in the Southeast Michigan - Metropolitan Detroit Area. The existing system was installed in 1980-81 and is a direct descendant of the John Lodge Freeway Surveillance project of the late 1960's. The State's existing five-year action plan calls for extending ATMS/ATIS coverage over a system encompassing some 250 miles. Staging, costs and all technical aspects of this plan were reexamined and refined in the context of evolving ITS technologies. The study reviewed traffic data, determined the area's functional requirements for ATMS/ATIS services, identified and analyzed alternative ATMS/ATIS technologies, and presented a staged plan of recommended actions. The study also developed a model approach to the development and deployment of alternative routings and traffic management plans for handling incidents.

Project Location:

Detroit, Michigan

Partner(s):

Michigan DOT, FHWA, Wayne County Road Commission, Road Commission for Oakland Co., Macomb Co Road Commission, MI State Police, SE Michigan Council of Governments.

Start Date:

September 1992

End Date:

October 1994

EL PASO, TEXAS EARLY DEPLOYMENT PLANNING STUDY

Description:

The study developed a plan to integrate real-time ITS technology with sound traffic management principles and focused on the movement of large commercial vehicles in the El Paso area and across the Mexican border. For example, truck locations, destination, type of load (if hazardous), and weight could be automatically tracked from an existing Transportation Management Center in City Hall. Current planning activities and implementation strategies of multiple agencies were integrated to facilitate the movement of trucks as a continuing activity. Prioritization of future improvements will be closely coordinated through a multi-jurisdictional Traffic Management Center.

Project Location:

El Paso, Texas

Partner(s):

Texas DOT, City of El Paso

Start Date:

April 1995

End Date:

December 1998

Estimated Total ITS Funds:

\$336,000

Estimated Total Project Cost:

\$420,000

EVALUATION OF TELECOMMUNICATIONS COST OF OWNERSHIP VERSUS COST OF LEASING TRADEOFF

Description:

The State of Maryland has conducted a detailed study to define its telecommunications requirements for the deployment of ITS throughout the State. This project provided a number of design options for their telecommunications, and conducted a detailed life cycle cost analysis of these options to determine if it should lease or own this infrastructure. In addition, Maryland has examined the relative value of various video quality levels to be used in their CCTV network surveying the roadways. They concluded that compressed video was acceptable to perform the required functions. This decision has a major impact on the cost of telecommunications. This project has been extended to produce both summary and detailed documentation on their results as well as the methodology, and to provide a video on the relative merits of compressed versus broadcast quality video. Finally, Maryland and their contractor have prepared a one day seminar on lessons learned in the telecommunications study, which are available on request from the ITS JPO:

(1) "A Case for Intelligent Transportation (ITS Telecommunications Analysis)," FHWA-JPO-97-0015

(2) "ITS Telecommunications: Public or Private? A Cost Tradeoff Methodology Guide," FHWA-JPO-97-0014

FRESNO, CALIFORNIA EARLY DEPLOYMENT PLANNING STUDY

Description:

This study resulted in a Strategic ITS Deployment Plan for the Fresno metropolitan area and Fresno County. The full range of ITS user services were considered in the development of this plan. The study sought stakeholder input, including the public, in order to develop a User Service Plan. Functional requirements were developed from the User Service Needs. These needs were considered along with funding and procurement issues in order to identify and screen alternative technologies. The Council of Fresno County Governments in partnership with Caltrans District 06 conducted this ITS effort with the concept of statewide coordination as a guiding principle, and developed a strategic plan for deployment of ITS technologies throughout Fresno County as well as coordinating it with other Central Valley ITS deployment efforts.

Project Location:

Fresno County, California

Partner(s):

California DOT and Council of Fresno County Governments

Start Date:

September 1996

End Date:

October 1998

GRAND RAPIDS, MICHIGAN AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

The Michigan Department of Transportation prepared a Strategic ITS Deployment Plan focusing on integrated freeway and major arterial system management. It also contained an Incident Management Program. The deployment plan identified "user service" requirements and objectives for the area, the "functions" necessary to support each service, and defined a system architecture. Identified user services to be included are areawide traffic management and traveler information systems, a system that facilitated the movement of public transit and emergency vehicles, and a data collection database. Various technologies reviewed for deployment included signal control equipment, a communications network, sensors, detectors, CCTV, HAR transmitters, changeable message signs, ramp metering, and the possible future accommodation of HOV operations. The Incident Management Plan is applied to the US-131 freeway through Grand Rapids.

Project Location:

Grand Rapids, Michigan

Partner(s):

Michigan DOT, FHWA, Grand Rapids & Environs Transportation Study, Grand Rapids Area Transit Authority, MI State Police, Kent Co Road Commission, Ottaqwa Co Road Commission, City of Grand Rapids

HARTFORD, CONNECTICUT AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

This study produced a Strategic ITS Deployment Plan for the Hartford metropolitan area. The full range of ITS user services were considered in the development of this plan. The Hartford MPO is a key player, along with the Connecticut DOT, in the study, and ensured public involvement in the process. This study was closely coordinated with future studies in New Haven, CT, and Springfield, MA, providing for a comprehensive plan for the I-91 corridor through southern New England. The overall goal is to prepare a strategic ITS deployment plan for the Hartford metropolitan area including a strategy for integrating the Hartford area system with other areas of the state. The plan covered a full range of ITS functions over a 20-year horizon. High priority needs include the integration of existing state freeway and arterial traffic management systems, implementing a regional incident management system, serving the information needs of select ISTEA-mandated management systems, and provision for coordination with ITS systems in other areas of the state. The Plan was developed using the FHWA ITS planning process outline (user services-based approach). The Plan includes eight tasks divided into two planning phases: development of an ITS User Services Plan and development of the ITS Strategic Deployment Plan.

Project Location:

Hartford, Connecticut

Partner(s):

Connecticut DOT and Capital Region Council of Governments (CRCOG)

Start Date:

June 1994

End Date:

April 1998

I-70 DENVER, COLORADO CORRIDOR EARLY DEPLOYMENT PLANNING STUDY

Description:

This Colorado DOT study focused on the application of ITS technology in the I-70 corridor west of Denver. The corridor has a high potential for developing the rural application of ITS technologies with heavy emphasis on Advanced Traffic Management Systems (ATMS) and Advanced Traveler Information Systems (ATIS). This study focused on developing a comprehensive implementation program of ITS technologies aimed at a multi-phase effort which identified the most feasible options, gains public support, and then enlists cooperation of private sector interests. The project has three phases. This effort included phase one only, in which a consultant identified and evaluated applicable ITS technologies, identified early action items, prepared a corridor master plan, assisted in educational efforts, and prepared reports on the project.

Project Location:

Denver, Colorado

Partner(s):

Colorado DOT

Start Date:

July 1992

End Date:

July 1996

I-94 MILWAUKEE TO MINNEAPOLIS AND I-90 BELOIT TO LACROSSE EARLY DEPLOYMENT PLANNING STUDY

Description:

The purpose of this ITS Early Deployment Planning Study was to develop a strategic plan to develop ITS Intercity Corridor initiatives which will improve mobility, efficiency and safety of travel on the I-94 corridor, Milwaukee to Minneapolis, and the I-90 corridor, Beloit to Lacrosse. The study proposal included the evaluation of the need for and the identification of ITS solutions appropriate for the corridors. This study focused on commercial vehicle operations, incident management and personal travel safety, and provision of route guidance and real-time travel condition information. ITS technology and systems applications existing or programmed for future implementation as part of the Gary-Chicago-Milwaukee ITS Priority Corridor were also considered as part of the study.

INCORPORATING ITS INTO REGIONAL TRANSPORTATION PLANNING

Description:

This four-year study began by examining current transportation planning methods used by MPOs and implementing agencies to address ITS deployment, particularly in the alternatives analysis stage. If such methods are inadequate, new approaches were to be developed. The resulting methods were applied to two case studies. The case studies covered an area or region, rather than a single traditional project. The range of transportation improvement projects considered included construction of new roads or lane miles, conventional signage or signal installations, transit improvements, Transportation Demand Management (TDM) measures, Advanced Traveler Information Systems, Advanced Traffic Management Systems, and Advanced Public Transportation Systems.

Phase I of this project was completed on 30 June 1996. The two cases studied were Houston, TX, and Seattle, WA. An analysis of the approach and methods used by the MPO's in these areas to select among projects as part of the Transportation Improvement Process (TIP) was conducted. A report was produced that documented this process and provided some recommendations for how to deal with ITS projects as part of the TIP. Based on the results of this phase the Seattle area was selected for a more detailed analysis of how to include and evaluate ITS enhancements to traditional highway construction projects. In Phase II, Mitretek initiated a modified Major Investment Study (MIS) type analysis to develop methods and techniques to evaluate transportation improvement alternatives, including alternatives with ITS enhancements. As part of Phase II, the analysis framework was defined and published in two reports, "Incorporating ITS into Corridor Planning Seattle Case Study," (March 1998). The Phase II report was revised based on comments received from DOT. This study was completed in August 1999 with finalizing the analysis results and a report on these methods for use by transportation planners.

Project Location: Washington, DC

Contractor(s): Mitretek Systems

Start Date: July 1995

INDIANAPOLIS, INDIANA AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

The purpose of this project was to determine which ITS User Services will be the most cost effective and beneficial for the Indianapolis area, culminating in the development of a multi-year strategic ITS deployment plan. The Indiana DOT has formed a "deployment committee" to implement the first of the plan's recommended improvements.

Project Location:

Indianapolis, Indiana

Partner(s):

Indiana DOT

Start Date:

June 1994

End Date:

July 1996

**Estimated Total
ITS Funds:**

\$400,000

**Estimated Total
Project Cost:**

\$500,000

ITS/CVO MAINSTREAMING PROJECTS

Description:

Since 1992, every State except Hawaii has participated in an ITS/CVO institutional issues study. These individual and multi-State studies provided forums for State regulatory agencies and representatives from the motor carrier industry to identify opportunities to streamline compliance functions with ITS/CVO technology applications. Now that the barriers to ITS/CVO deployment have been identified, the States are moving towards the next stage - ITS/CVO Mainstreaming.

Mainstreaming means moving ITS/CVO services beyond concept development and testing into operation. The basic building block for the ITS/CVO program is the State; however, State CVO programs must be developed in the context of regional CVO programs that serve the nation's major trucksheds. Most truck trips are under 200 miles from home base and are concentrated within major population and economic regions, which can be defined as 7 regional platforms (SE, SW, MW, NE, NW, W, and Great Lakes). The CVO program must establish and maintain regional CVO forums aligned with these trucksheds to ensure that CVO services are delivered where the trucks are and that services within trucksheds are relatively uniform from the carrier's perspective.

This program has many functions: 1) the support of State officials (including DOT, DMV, State Patrol, DOR officials, etc.) and motor carriers (especially smaller motor carrier firms) participation in regional ITS/CVO forums, 2) the analysis of benefits and costs of ITS/CVO technologies to individual State agencies as well as motor carriers, 3) the development of ITS/CVO business plans for regional platforms as well as individual States, and 4) the facilitation of State-and region-wide long term deployment of proven ITS/CVO technologies. Funds also will support full-time, regional champions who will coordinate and convey the purposes, technologies, costs, and benefits of ITS/CVO activities at the states to legislatures, business, and the public.

Currently, there are seven CVO Mainstreaming projects comprised of 33 States. Several states are seeing the benefits of joining multiple regional mainstreaming consortia to ensure that their individual state mainstreaming activities are synchronized with neighboring states. The Regional Consortia (with lead states identified) are as follows:

I-95 Coalition/Northern: NJ* (Lead) MA, CT, RI, ME

I-95 Coalition/Eastern: NJ* (Lead), WV*, VA*, MD, DE, NY, PA

Advantage CVO/Southeastern: KY* (Lead), NC, TN, GA, LA, VA*

Advantage CVO/Great Lakes: KY* (Lead), OH, IN, MI, MN, WI, WV*

Mississippi Valley: MO--Lead, KS, NE, SD

Northwestern: WA--Lead, ID, MT, WY, UT*

Western: OR--Lead, CA, UT*, CO

* Designates states participating in more than one regional consortium.

Project Location:

As reflected in the description of the Regional Consortia.

ITS/CVO TRAINING

Description:

The primary objective of this effort was to plan, develop, implement and update ITS/CVO training courses. These courses provided ITS/CVO state, federal and private managers and implementers with the skills and knowledge necessary to accomplish the ITS/CVO Mission and Goals. ITS/CVO training curriculum consisted of two broad areas: project management skills development and technical skills development. Upon completion of these courses, participants were able to:

- * Understand and articulate the ITS/CVO Program's Vision, Mission and Program Goals and Objectives;
- * Understand the standards and procedures for ITS/CVO program funding, development, testing and deployment along with operations and technology maintenance requirements;
- * Understand the institutional issues or barriers to program success, and promote the importance of the non-technical agreements which are critical for a state to develop, thus ensuring successful long-term technology deployment;
- * Understand the technical issues in the areas of communication technologies, system integration, and technology standards, as well as the strategies necessary to deploy these technologies;
- * Understand the requirements for implementation of strategies designed to ensure cooperation among state partners, and serve as a catalyst for further efforts toward deployment of ITS/CVO technologies.

A basic management course is the first in a series of courses which will help create uniformity and standardization in reaching common goals and objectives among ITS/CVO partners and stakeholders. This course was available in the spring of 1997. Technical courses will provide federal and state personnel with the skills necessary to effectively deploy, operate and evaluate ITS/CVO technologies that enhance public safety and are cost-effective, user friendly, and interoperable with existing public and private information systems. Technical courses were available in the fall of 1997. Both management and technical courses will be updated regularly.

ITS STRATEGIC PLAN FOR MARICOPA COUNTY - PHOENIX AREA

Description:

This study resulted in the development of a Strategic ITS Deployment Plan for the Phoenix Metropolitan Area. The study sought stakeholder input, including the public, in order to develop a User Service Plan. Functional requirements were developed from the User Service Needs. These needs will be considered along with funding and procurement issues in order to identify and screen alternative technologies. The administration of the project was carried out by the Maricopa County DOT. Coordination of the study was a cooperative effort between the County and the MPO and took advantage of steering teams previously formed to study the regional coordination of the traffic signal systems.

Project Location:

Phoenix, Arizona

Partner(s):

Arizona DOT and Maricopa County DOT

LOUISVILLE, KENTUCKY AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

This planning study developed a regional Advanced Traffic Management Systems (ATMS) plan for metropolitan Louisville, Kentucky. A consultant performed the necessary studies for development of the early implementation plan. The tasks included:

1. Inventory the existing system and collect data including traffic volumes, speeds, and delays.
2. Develop management strategies and alternative routing plans for incidents. Elements considered include detection, communication systems, closed circuit TV, changeable message signs, highway advisory radio, and a centralized traffic control center. The end product was the Traffic Management Plan, the recommended system modifications required to implement the plan, and the estimated cost of implementing each recommended element.
3. Develop and optimize traffic signal timing plans on selected arterials in Louisville.

Project Location:

Louisville, Kentucky

Partner(s):

Kentucky Transportation Cabinet

LOWER HUDSON VALLEY/WHITE PLAINS, NEW YORK EARLY DEPLOYMENT PLANNING STUDY

Description:

The area's coordinated Intelligent Transportation System (ITS) effort developed a strategic plan for area-wide deployment. The study followed the FHWA's User Services planning and deployment process. Key elements of the study included:

- * Establishment of a coalition of key stakeholders;
- * Development of an area-wide Strategic Plan based on the area's unique user service needs;
- * Identification of key early implementation projects;
- * Development of a Phased Implementation Plan with timetable and funding availability;
- * Identification/quantification of operations and maintenance resource needs;
- * Identification of needed institutional arrangements;
- * Establishment of public outreach programs.

In support of this ITS effort, the New York State Department of Transportation has programmed more than \$27 million in their five-year capital program for Intelligent Transportation Systems (ITS) activities for the Lower Hudson Valley area.

Project Location:

Lower Hudson Valley/White Plains, New York

Partner(s):

NASHVILLE, TENNESSEE EARLY DEPLOYMENT PLANNING STUDY

Description:

The Nashville Area MPO implemented a program of ITS user services which emphasizes traveler and tourist information and traffic management. This program was built upon the traffic and transit management and infrastructure improvements already underway in the 5-county area. Services were concentrated in locations which are the primary destinations of tourists and business travelers, including the Nashville CBD, Opryland, Music Row, Nashville International Airport, and the Vanderbilt University area.

Traveler information services will include traveler advisories, traveler information services (including non-traffic information), trip planning, location displays, and route selection. These services will be offered at visitor information centers, intermodal centers such as the landport, convention hotels, the regional airport, and along major travel corridors.

The traveler information services would be tied in with a Traffic Management Center (TMC) which would offer a coordinated program of accident detection and management, traffic network monitoring, traffic control, and construction management.

Project Location:

Nashville, Tennessee

Partner(s):

Tennessee DOT and Nashville MPO

Start Date:

December 1994

End Date:

July 1997

NATIONAL CAPITAL METRO AREA (UMBRELLA) EARLY DEPLOYMENT PLANNING STUDY

Description:

This study provided guidance on regionwide ITS applications and priorities to the agencies responsible for developing and implementing transportation management systems in Maryland, Virginia, and the District of Columbia. The primary objectives were (1) to identify effective mechanisms for interjurisdictional cooperation to make sure ITS activities are compatible and coordinated, (2) to identify methods to establish a basis for area decision makers and political leaders to endorse ITS on a regionwide basis, and (3) to identify options for a high level regional system architecture for the National Capital Metropolitan Area.

Project Location:

National Capital Metro Area

Partner(s):

OKLAHOMA CITY, OKLAHOMA AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

The Oklahoma City Areawide Early Deployment Planning Study established criteria to measure the performance of a proposed traffic operations system, including reductions in travel times, fuel consumption, accidents and intersection delay. A more qualitative measurement involved a survey of drivers who use these areas' arterial and freeway corridors to determine their perception of improved traffic flow. The study examined needed functional areas for a traffic control center, including traffic network monitoring, adaptive traffic control, traveler advisory, communications, incident detection and management, parking management and demand management. The study determined where and when these services are needed.

Project Location:

PITTSBURGH, PENNSYLVANIA AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

The Pennsylvania Department of Transportation (DOT) through this deployment planning study has developed strategic plans for the Pittsburgh area freeway management system. The system, which will mainly cover I-276/376, will tentatively include closed circuit television, parkway advisory radio, ramp metering, surveillance and control system, changeable message signs (CMS), and an operations center. This Freeway Management System will interface with other existing and planned systems (i.e., existing high occupancy vehicle HOV lanes, changeable message signs, a planned telephone advisory system, and the planned City of Pittsburgh computerized traffic signal system).

Project Location:

Pittsburgh, Pennsylvania

Partner(s):

Pennsylvania DOT

Start Date:

December 1992

End Date:

March 1994

**Estimated Total
ITS Funds:**

\$400,000

PORTLAND, MAINE EARLY DEPLOYMENT PLANNING STUDY

Description:

The Greater Portland Council of Governments (GPCOG) conducted an early deployment study that developed a strategic deployment plan for ITS technologies which addresses the needs of the Portland metropolitan area.

Project Location:

Portland, Maine

Partner(s):

Greater Portland Council of Governments

Start Date:

September 1996

End Date:

March 1998

**Estimated Total
ITS Funds:**

\$56,000

**Estimated Total
Project Cost:**

\$70,000

Contacts:

John Dewar	FHWA Maine Division, HPR-ME	(207) 622-8350	Ext. 22
Joe Kott	Greater Portland Council of Governments	(207) 774-9891	

PORTLAND, OREGON AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

The plan developed by this effort is a six-year plan for implementation of an Advanced Traffic Management System (ATMS). The estimated total capital cost for the six-year implementation is approximately \$25 million. Detection will include closed circuit television, dedicated cellular service and detectors primarily at ramp meter locations. The Traffic Operations Center (TOC) will utilize existing space owned by ODOT and be remodeled to accommodate TOC equipment and personnel.

Project Location:

Portland, Oregon

Partner(s):

Oregon DOT

Start Date:

July 1991

End Date:

January 1995

**Estimated Total
ITS Funds:**

\$400,000

**Estimated Total
Project Cost:**

\$500,000

PROCUREMENT FOR ITS

Description:

The objectives of this project were to (1) identify and analyze contracting issues which have arisen or are likely to arise in the development and deployment of ITS and which may be constraining or hampering the implementation of ITS technologies and (2) develop legally sound, innovative models for contracting for ITS technologies by State and local contracting agencies. The research effort included an examination of the requirements for competitive bidding, combined bidding, combined bidding/joint ventures, advertisement, content of proposals or bids, use of patented processes or technologies or exclusive sources, bid security deposits, submission of proposals, negotiations, awards of contracts, and intellectual property rights to technology developed or acquired under the procurement contract. A final report titled "Innovative Contracting Practices for ITS" has been produced.

Project Location:

Cambridge, Massachusetts

Contractor(s):

L. S. Gallegos & Associates

Start Date:

October 1994

End Date:

December 1996

PROVIDENCE, RHODE ISLAND AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

This project created a plan which will direct the implementation and operation of ITS in the State of Rhode Island based on the specific needs and resources of the State. The study used the ITS Planning and Project Deployment Process. Rhode Island is pursuing ITS and their Congestion Management System planning concurrently, and is developing and utilizing common baseline data, performance standards, and goals.

Project Location:

Providence, Rhode Island

Partner(s):

Rhode Island DOT

Start Date:

January 1994

End Date:

May 1997

**Estimated Total

RALEIGH/DURHAM/CHAPEL HILL, NORTH CAROLINA AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

This project was an areawide study of potential ITS deployment activities in the Raleigh/Durham/Chapel Hill area. A twelve-county study area has been identified; however, the primary focus of the report was the most urbanized counties including Durham, Orange, and Wake. Through a cooperative effort by the North Carolina Department of Transportation, the Metropolitan Planning Organizations (MPO), and local advisory committees, the study detailed both short-term, medium-term, and long-term traffic management needs for this area.

Project Location:

Raleigh/Durham/Chapel Hill, North Carolina

Partner(s):

North Carolina DOT

Start Date:

July 1994

End Date:

April 1997

**Estimated Total
ITS Funds:**

\$250,000

**Estimated Total
Project Cost:**

RICHMOND, VIRGINIA AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

The purpose of this study was to identify opportunities for the application of ITS services in the Richmond metropolitan area and to develop a strategic deployment plan that provides for coordination among the involved jurisdictions and integration of ITS with existing systems. The Richmond metropolitan area includes the cities of Richmond, Petersburg, Colonial Heights and Hopewell and the counties of Henrico, Chesterfield, and Hanover in central Virginia.

Project Location:

Richmond, Virginia

Partner(s):

Virginia DOT

Start Date:

July 1994

End Date:

October 1996

**Estimated Total
ITS Funds:**

\$400,000

ROCHESTER, NEW YORK AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

This project provided direction for the design of an area-wide advanced traffic management system to be implemented within the next few years and integrated with the existing computerized county-wide signal system. The project consisted of three tasks. The objective of Task I was to conduct an area-wide corridor assessment to inventory and identify existing congestion problems. This task also evaluated freeway management techniques and detection technologies. Task II reviewed communication processes and incident response plans in order to develop a comprehensive incident management program. Task III focused on overcoming the technical and legal stumbling blocks that impede the working relationship between area jurisdictions. This was accomplished by identifying, prioritizing, and recommending solutions for inter-jurisdictional issues.

Project Location:

Rochester, New York

Partner(s):

New York State DOT

Start Date:

September 1992

End Date:

May 1996

SAN ANTONIO, TEXAS EARLY DEPLOYMENT PLANNING STUDY

Description:

The purpose of this study was to develop a metropolitan system ITS architecture which integrates the Texas DOT, City of San Antonio, VIA (San Antonio's transit authority) and the MPO's current management systems into a single unified system. This will give each organization involved a standard which will allow sharing of data, control, and response. This project has been incorporated into the ITS Model Deployment project in San Antonio, Texas.

Project Location:

San Antonio, Texas

Partner(s):

Texas DOT

Start Date:

April 1995

End Date:

September 1998

**Estimated Total

SHARED RESOURCES PROJECT

Description:

A number of state and local transportation authorities have formed partnerships with telecommunications companies to exchange access to public roadways for telecommunications capacity to be used principally for ITS projects. This report examines the legal and institutional issues encountered by a number of these partnerships. After completing the research for wireline telecommunications, the study was extended to examine these same issues when wireless tower sites are the subject of location on public rights-of-way. The results of these two analyses have been published in three reports. "Shared Resources: Sharing Right-of-Way for Telecommunications;--Guidance on Legal and Institutional Issues" and the "Final Report." FHWA-JPO-96-0015 & 14. The third report is "Wireless Shared Resources: Sharing Right-of-Way for Wireless Telecommunications," FHWA-JPO-97-0024. These reports are available from the ITS Joint Program Office.

The JPO is providing workshops to public agencies on these subjects on a request basis.

ST. LOUIS, MISSOURI AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

This study developed a freeway management plan for the bi-state St. Louis area. The completed plan incorporates ITS technologies principally in the Advanced Traffic Management Systems (ATMS) and Advanced Traveler Information Systems (ATIS) areas. It recommends specific strategies for incorporation into a comprehensive plan designed to meet future needs using ITS technologies. It assesses current operations such as the call box and emergency patrol operations. It makes recommendations for staffing structure and requirements. Elements considered in the plan included communications techniques, detection methods, information dissemination, ramp metering and cellular incident response.

TAMPA, FLORIDA AREAWIDE EARLY DEPLOYMENT PLANNING STUDY

Description:

The project developed an action plan for the implementation of an integrated transportation information center for the Tampa Bay area. The plan included methods of obtaining real-time traffic condition data, integrating it into a reliable and continuous database, and disseminating condition information to the traveler in a usable and timely manner. The project contained six work tasks: (1) establish a multi-agency project advisory group to oversee the project work; (2) identify and evaluate the methods available for gathering real-time traffic condition information; (3) analyze control center alternatives, including location and operations; (4) analyze various information dissemination techniques addressing multiple media applications; (5) conduct a small scale market research effort to determine user preferences for interpreting traffic condition information; and (6) provide a final report consisting of technical memoranda and the recommended action plan. Also, a brochure oriented to the general public was developed summarizing the project action plan.

Project Location:

Tampa, Florida

TUCSON ADVANCED TRANSPORTATION TECHNOLOGIES IMPLEMENTATION PLAN

Description:

This study resulted in the development of a Strategic ITS Deployment Plan for the Tucson metropolitan area. The study was done in four parts, including a resource and stakeholder input phase which will result in a User Service Plan. The study addressed infrastructure and services that are available or needed to develop strong interagency communications and will result in a Communications Plan. The project used this information, as well as functional requirements, funding and phasing, to develop a Deployment Plan. The administration and coordination for the project was carried out by the MPO with individual components of the study subcontracted as needed. Steering teams have been formed to provide guidance for each of the study components of this plan.

Project Location:

Tucson, Arizona

Partner(s):

Arizona DOT and Pima Association of Governments

ITS RESEARCH CENTERS OF EXCELLENCE

Description:

ITS Research Centers of Excellence (RCE's) program mission is to establish internationally recognized centers of excellence that provide long term ITS research solutions, promote ITS technologies and prepare ITS professionals to build and operate these intelligent transportation systems. The centers provide approximately \$1,500,000 in matching funds each year. Over one hundred students are working in RCE-related projects at the centers. Areas of emphasis are as follows:

University of Michigan:

Seven major areas define the University of Michigan Center's focus on near term, pre-competitive aspects of ITS: Information Technology, Controls Technology, Enterprise/Institutional Issues, Traffic Modeling, Human Factors and Behavior, Evaluation and Fleet Management.

Texas A & M:

The Texas A&M Center focuses on Public Transportation Services, Traffic Management Services and International Border Transportation Services.

Virginia Polytechnic Institute:

The Virginia Polytechnic Institute Center focuses on Incident Management, Automated Highway Systems, Smart Highways (sensors/communications), Advanced Traveler Information Systems, and Advanced Public Transportation Systems.

A report titled "The ITS Research Centers of Excellence Program" may be obtained by contacting:

ITS RCE Clearinghouse

Texas Transportation Institute

The Texas A&M University System

College Station, Texas 77843-3135

Tel: (409) 845-1734

September 1993

End Date:

December 2000

NATIONAL ADVANCED DRIVING SIMULATOR (NADS)

Description:

The objective of this NHTSA project is to develop a design for a state-of-the-art driving simulator in the U.S. that will serve as a national research asset for use by scientists and engineers in both the public and private sectors. It is estimated that NADS will cost \$32 million to design, construct and validate. This driving simulator will enable researchers to conduct multi-disciplinary investigations and analyses on a wide range of issues associated with traffic safety, highway engineering, Intelligent Transportation Systems (ITS), human factors, and motor vehicle product development. Phase I, which is discussed here, covers the design of the NADS. Phase II will cover actual construction.

Completed Projects

AUTOMATED TRAVEL TIME ACQUISITION PROTOTYPE

Description:

This project involved the design, development, and testing of a prototype device for automating traffic speed and travel time surveys. The device makes use of a commercial off-the-shelf GPS receiver and a laptop computer in a moving vehicle. It acquires speed and location information in real time and generates time vs. distance and speed vs. distance plots. Data can be stored for subsequent playback and analysis. The device is highly portable and can be installed in a vehicle in a matter of minutes.

A prototype was built and laboratory testing successfully completed. Field testing was carried out on suburban and urban freeways and arterials. The results agree with those obtained manually and with those obtained using commercial devices hard-wired to the transmission. Furthermore, the continuous stream of position data generated by the device was found to offer a number of advantages over manually-collected "point" data. Efforts are underway to support field application of the device by the Metropolitan Washington Council of Governments and other state and local jurisdictions.

ITS IDEA PROGRAM

Description:

The Innovations Deserving Exploratory Analysis Program solicited "IDEAs" for and funded feasibility studies of high-risk, innovative Intelligent Transportation Systems (ITS) concepts. Concepts which show continuing promise may move to phase II funding support, wherein prototype development can occur. The objective of this initiative was to establish a continuing program to identify and explore innovative concepts for ITS that are proposed by individual researchers both within and outside the usual transportation research community. This intermodal ITS program was supported by the Federal Highway Administration in the amount of \$6.5 million. Additionally, the National Highway Traffic Safety Administration and the Federal Railroad Administration contributed \$2 million and \$1 million respectively to program support.

A progress report titled "Emerging Concepts and Products for Intelligent Transportation Systems" may be obtained by contacting:
