FOREWORD

This report is one of a set of reports documenting the development of a cost-effectiveness model for guardrail selection which includes cost parameters for various guardrail configurations as well as criteria for analysis of system effectiveness under various dynamic impact conditions.

Initially, two computer programs were developed for (1) determining the cost-effectiveness of a specific guardrail type and (2) comparative cost-effectiveness and rankings of eleven guardrail types. It is important to note that in the development and application of this model the guardrail was assumed to be warranted.

A speed distribution reported by Michigan in 1974 was used in the initial model development. Subsequently, another speed distribution developed by Calspan Corporation was used in the model.

The Calspan speed distribution was developed through the reconstruction of single vehicle accidents on two lane rural roads. The Michigan data was obtained from police reports on mostly freeway accidents. Because of differences in accident location and possibly also due to differences in data collection procedures, the Calspan speeds are generally lower than the Michigan speeds. For this reason the Calspan speed distribution data may be more appropriate for use on non-freeway sites while the Michigan speed distribution data may be more indicative of freeway conditions. The use of the lower speed distribution did, as expected, affect the guardrail rankings.

In order to provide flexibility, the speed distribution has been changed to a data input allowing the user to choose between the Michigan produced speed distribution, one developed by the Calspan Corporation or data developed directly by the user.

Two sets of site selection tables were also developed from the models for use in the field in making rough approximations of how the various guardrail types will rank. One set is based on the Michigan data; the other set is based on the Calspan data. In both cases, only the direct costs of the accidents were used. This was done to avoid the controversy surrounding the societal costs of accidents, the major portion of which is the loss of future earnings. This result has little effect on the relative rankings but does effect the site selection tables. The cost variable is also an input variable when using the models. Thus, the user may choose what he considers appropriate values for the costs of accidents.

Sufficient copies of the Executive Summary and the two volume report are being distributed to provide a minimum of one copy to each FHWA regional office and one copy to each FHWA division offices. Copies of the site selection tables based on the Calspan data will be made available to satisfy individual requests.

16. Abstract This research was conducted to develop a cost-effectiveness model for guardrail selection that includes cost parameters for eleven (11) guardrail configurations and criteria for analysis of system effectiveness under various dynamic impact conditions. Vehicle classes include 2250-lb (1021-kg) and 4500-lb (2041-kg) vehicles. Accident severities were based on extrapolations of full-scale test data and verified by means of guardrail accident reconstruction data. Two computer programs were developed: (1) the SSCOST program for cost-effectiveness values (state cost, societal cost, total cost, and benefit-to-cost ratio) of a single specified guardrail type with given roadway conditions, and (2) the COCOST program for comparative cost-effectiveness values and ranking of the eleven guardrail types with given roadway conditions. Program inputs are simple to prepare, and computer run times are minimal. This volume is a user's manual for applying the cost-effectiveness computer programs for (1) selection at a particular site of the most cost-effective guardrail system of the eleven included types, (2) guardrail placement at a site for the optimum location and guardrail type, and (3) priority ranking of several site selections for appropriation of available funds. Technical documentation supporting the computer algorithm is contained in Volume I.

PREFACE

Since the completion of this report, a draft final report has been submitted for Contract No. DOT-FH-11-8501, "Methodology for Reducing the Hazardous Effects of Highway Features and Roadside Objects," by Calspan Field Services, Incorporated. This contract involved the collection and analysis of data for 7,972 accidents on both freeway and non-freeway types of roads.

The impact speed distribution obtained from this Calspan study differed significantly from that used in this report (see Figure 6, page 36 of Volume I). Also, a question was raised by FHWA concerning the occupant severity index (see Figure 9, page 51 of Volume I). Consequently, sensitivity analyses were conducted of the speed distribution and severity indices used in the cost-effectiveness model of this study. The conclusions of the analyses were that the model is sensitive (order of preference of guardrail types as well as corresponding values) to both changes in severity and the change in speed distribution.

Details of these sensitivity analyses are shown in the Addendum starting on page 48. Because of the sensitivity of these parameters, the computer programs discussed herein have been changed to include user specified input for speed distribution percentages and severity index factors. Further, sensitivity analyses and site selection tables presented herein have been rerun with the Calspan speed distribution.

If the Michigan speed distribution shown in Figure 6 of Volume I is representative, the user can apply the results of this report directly. If the Calspan distribution is more representative (see Addendum), the regenerated results can be obtained from FHWA for use. Finally, if other distributions or modifications of the severity indices (Figure 9 of Volume I) are desired, the user can specify the input values and conduct computer runs to prepare his own set of guardrail selection aids.

I. INTRODUCTION

With the problems of ever-increasing highway construction costs and the limited funding available, it has become of critical importance that a cost-effectiveness decision policy be formulated for selecting the various alternatives between guardrail types. This is particularly true for the rural, low-volume highway. With such roads, strict adherence to current guardrail warranting and installation procedures could lead to the installation of guardrails of maximum effectiveness at some sites and no installations at other sites because of the lack of available funds. Thus, the need exists for the development of effective criteria for the selection of guardrail types based on a cost-effectiveness analysis. The value of such a cost-effectiveness decision-making policy need not be limited to low-volume roads and could result in more efficient utilization of available funds for all types of highway systems.

The objective of this program was to develop a cost-effectiveness model for guardrail selection that includes cost parameters for various guardrail configurations as well as criteria for analysis of system effectiveness under various dynamic impact conditions. Two computer programs were developed: (1) the SSCOST program for cost-effectiveness values (state cost, societal cost, total cost, and benefit-to-cost ratio) of a single specified guardrail type with given roadway conditions, and (2) the COCOST program for comparative cost-effectiveness values and ranking of the eleven included guardrail types with given roadway conditions. For flexibility in use of the model, particularly with regard to regional costs, most of the required input parameters can be specified by the user. However, the input format is quite simple and does not require the use of experienced programmers.

The following definitions apply with regard to the cost-effectiveness values used in the study:

- (1) state cost — money spent by the state in installing and maintaining the guardrail.
- (2) societal cost — costs associated with accidents, including costs of injuries and fatalities, costs of guardrail and vehicle damage, and cost of traffic delay.
- (3) total cost — the sum of state and societal costs.
- (4) benefit — the difference between societal cost with no guardrail installation and societal cost with the guardrail installed. Hazard types include fixed objects or embankments.
- (5) benefit-to-cost ratio — the ratio of the benefit to the state cost. Thus, to effect a savings in societal costs greater than the state cost of the guardrail installation, a benefit-to-cost ratio greater than unity must be realized.

Volume I of this report contains technical documentation and describes the research efforts undertaken to collect and analyze the available data, quantify the pertinent parameters of the cost-effectiveness model, and develop the computer algorithm. This volume contains the computer program listings and instructions and examples for applying the programs for (1) selection at a particular site of the most cost-effective guardrail system of the eleven included types, (2) guardrail placement at a site for the optimum location and guardrail type, and (3) priority ranking of several site selections for appropriation of available funds. Representative costs are supplied for those engineers and administrators who might wish to use them, and tables are included for field use in site rankings of the eleven included guardrail types.

II. BASIS OF PROGRAM

The dashed-line portion of Figure 1 represents the cost-effectiveness analysis in the guardrail design process. Note that though the need for the guardrail exists, as determined by standard warranting procedures, the guardrail construction may not be warranted because it is not cost effective. Further, construction may be delayed even for cost-effective sites because of economic constraints. Results of the cost-effectiveness analysis can be used to establish priorities that will be helpful in selecting the most cost-effective installations with limited available funding.

The cost-effectiveness algorithm used in this study is based on present-worth state and societal costs for the installation of the eleven (11) guardrail types shown in Table 1. Comparison of the guardrail types for site selection or priority ranking can be made on the basis of (1) total societal costs, (2) total of state and societal costs, or (3) benefit/cost ratios. In order to accomplish this, it was necessary in the study to estimate the required inputs shown in Figure 1. These include the following:

- (1) traffic mix (fractions of total traffic by 2250-lb and 4500-lb vehicles)
- (2) number of encroachments
- (3) probabilities of out-of-control vehicles traversing the offset distance to the guardrail or obstacle

- (4) distribution of vehicle speeds
- (5) distribution of impact angles.
- (6) accident severities in terms of guardrail damage, number of occupant injuries or fatalities, and vehicle damage for each combination of the category vehicle speeds and impact angles
- (7) travel delay time for accident blockage and guardrail repair
- (8) costs of injuries, fatalities, vehicle damage, travel delay, and guardrail installation, repair, maintenance, and salvage value
- (9) service life of the guardrail and rate of interest.

Details of how each of these items was quantified are discussed in Volume I, Technical Documentation.

III. LIMITATIONS OF PROGRAM

As with any cost-effectiveness program, certain limitations exist because of the complexities of the problem, the meager data that is available, and the assumptions that must be made to fill the gap areas. Thus, engineering judgment should be used along with the program in making the guardrail selections and appropriating funds. The following should be considered in the process:

- (1) Certain sites sometimes demonstrate an area of unusually high accident frequencies that may or may not be identified by the cost-effectiveness program. Such sites might have to be considered as high-priority spot improvement locations.
- (2) This program is concerned with guardrail selection at sites where guardrails are warranted. Situations are not included in which alternate means are employed to eliminate the warrant, such as flattening slopes or removing the obstacle. However, the program can be used to compare costs of installing guardrail with these other alternatives.
- (3) The BARRIER VII computer program was used to extrapolate full-scale vehicle crash test data and establish severities for the various combinations of vehicle speeds and impact angles. This program will not predict vehicle wheel snagging on the guardrail posts, which has been demonstrated in full-scale tests to produce severe results in stiff post systems without adequate blockouts or with the larger post spacing. For example, suppose a guardrail order of Designs C, A, and G2 is indicated by the program and the evaluation criterion used for the ranking (i.e., societal cost, total cost, or B/C ratio) does not differ significantly for the three systems. Both guardrail types A and C with their 12.5-ft (3.81-m) post spacing and strong posts have demonstrated the tendency for wheel snagging and vehicle pocketing. Though not supported by study of test data in this program, it is asserted in the 1977 AASHTO "Guide for Selecting, Locating, and Designing Traffic Barriers" that experience also appears to indicate that the longer post spacings may allow a rail to twist into a ramp and thus cause vaulting. Thus, excluding local considerations that might dictate the use of A or C, type G2 with its weak posts would be the choice to reduce these tendencies. This demonstrates the use of engineering judgment in conjunction with the program rankings in making the final guardrail selection.
- (4) In order to establish benefit/cost ratios, it was necessary to estimate average severity levels for a typical accident with no guardrail. Fixed object obstacles and embankments are included in the program. From very limited accident data,⁽¹⁾ it was assumed that a typical accident for embankments would result in average severities of 0.05 fatality, 0.50 injury, and 0.50 vehicle damage. Average severities assumed for fixed objects were 0.50 fatality, 0.50 injury, and 0.50 vehicle damage per accident. Further, severities of 0.50 fatality, 0.50 injury, and 0.50 vehicle damage were assumed when the dynamic deflection of the guardrail exceeded the guardrail-to-obstacle distance. The resulting evaluation values will not materially affect the rankings at the site where the program has been applied. However, in comparing the program B/C ratios with those of fix-up alternatives other than guardrails, inconsistencies might occur because of the manner in which these alternative benefits are derived.
- (5) In establishing severities, only one vehicle occupant was assumed so that occupant severities were set at 1.0 fatality and 0.0 injury or 0.0 fatality and 1.0 injury. If it is desired to expand from this occupant base to some known accident base, it can be done by modifying the input values of injury and fatality costs. For example, Council and Hunter⁽²⁾ found from North Carolina data that averages of 1.18 fatalities and 1.118 injuries occurred per fatal accident and 1.601 injuries per injury accident. Using base costs of \$84,400 for fatalities (with \$900 of property damage included) and \$5,350 for injuries,

they used $1.18 (84,400) + 1.118 (5350-900) = \$104,567$ and $1.601 (5350) = \$8,565$ for fatality and injury costs, respectively, in 1973 dollars. Volume I of this report shows that the relative priority ranking of guardrails is not significantly affected by wide ranges of fatality and injury costs. However, the actual societal cost, total cost, and benefit/cost values will change considerably.

- (6) Only two vehicle classes are included in the program: 2250-lb vehicles to represent the smaller automobiles and 4500-lb vehicles to represent the larger automobiles and light trucks. If known, the vehicle mix can be specified in the input data.
- (7) A worksheet approach was attempted for field calculations to determine site guardrail priorities. However, with the large number of variables involved, the accompanying set of severity and travel delay tables would be too voluminous. The set of tables for site selection in Appendix A involves the specification of values and costs for a number of the variables that may not be applicable for a particular site. Consequently, these tables are limited to rough approximations of how the various guardrail types will rank. For more accurate analysis, and for setting priorities in appropriation of funds, the simple field data should be recorded and sent into the state office for computer analysis. Both CDC and IBM versions of the program have been prepared so that the program can be made operational on the various state computers with a minimum of effort.

IV. GUARDRAIL WARRANTS AND LENGTH OF NEED

It is assumed in this program that guardrails are warranted at the various sites of interest. References 3, 4, and 5 contain warranting procedures. References 4 and 5 also contain methods for determining the guardrail length of need. However, these methods produce lengths that might be considered conservative in view of the current economic constraints, particularly for the low volume rural road. For example, for the condition shown in Figure 2, the Reference 4 method produces a value for the end of guardrail need of

$$X_U = \left(1 - \frac{4}{10}\right)(400) = 240 \text{ ft}$$

With a 50-mph speed and 5000 ADT, the method of Reference 5 yields

$$X_U = \left(1 - \frac{4}{10}\right)(290) = 174 \text{ ft}$$

A method that would produce what might be considered to be an absolute minimum guardrail length of need is illustrated in Figure 3. Assume the vehicle is a standard 4500-lb automobile traveling at 70 mph with a coefficient of tire-to-pavement friction of 0.50. Then the radius of turn of the vehicle can be used to determine the offset distance X by simple geometric principles. Details of the analysis are shown in Volume I of this report. Table 2 shows the resulting values of X for various values of D and $D+W$. For example, for the upstream end of the obstacle in Figure 2, $D = 6 + 4 = 10$ ft and $D+W = 6 + 4 + 3 + 3 = 16$ ft. From Table 2, the corresponding X -value

$$X_U = 71 \text{ ft}$$

is read directly. For the downstream end, $D = 6 + 12 + 4 = 22$ ft and $D+W = 6 + 12 + 4 + 3 + 3 = 28$ ft, which, from Table 2, gives

$$X_D = 40 \text{ ft.}$$

Assuming the actual length of the obstacle is $L = 100$ ft, the length of guardrail need, as shown in Figure 3, becomes

$$X_U + L + X_D = 71 + 100 + 40 = 211 \text{ ft}$$

It is recommended that a minimum guardrail length of 150 ft be used for all cases. Note in Figure 2 that an adequate anchor and crashworthy terminal should also be placed beyond both ends of the guardrail need.

Table 2 can also be used to determine the exposure length of the obstacle, a required input for the COCOST computer program. Again, for Figure 2, the upstream values of $D = 6 + 4 + 3 = 13$ ft and $D+W = 6 + 4 + 3 + 3 = 16$ ft give

$$X_U = 48 \text{ ft}$$

from Table 2. Downstream values of $D = 25$ ft and $D+W = 28$ ft produce

$$X_D = 30 \text{ ft}$$

Then the obstacle exposure length becomes

$$X_U + L + X_D = 48 + 100 + 30 = 178 \text{ ft}$$

80	123	121	118	115	112	109	107	104	101	98	95	93

Note that this method gives significantly shorter guardrail lengths of need than the methods of References 4 and 5. Hence, some discretion might be warranted in its use. If the terminal is satisfactory for near head-on impacts, such as the breakaway cable terminal, the longer runout lengths of References 4 and 5 could be overly conservative. Flaring the guardrail ends could also be helpful in this regard (see Reference 5). Of course, the shorter lengths will have the advantage of fewer hits and, because of the construction cost savings, could conceivably result in more installations than would be afforded with the longer lengths. However, use of the method should probably be restricted to low volume rural roads.

V. REPRESENTATIVE COSTS AND INPUT VALUES

The cost-effectiveness model was developed with a view of providing flexibility in the specification of input data so that a particular highway agency can insert its own values for costs and other parameters. Discussed in this section are representative or typical mid-1975 values that have been used in the sample problems and that can be used by an agency if local data is not readily available.

Traffic Mix

It is necessary to specify the fraction of compact (2250-lb) and standard (4500-lb) automobiles for the traffic mix. Questionnaires sent to the states resulted in the following average values:

Fraction of 2250-lb vehicles = 0.25

Fraction of 4500-lb vehicles = 0.75

Guardrail Costs

Table 3 shows average guardrail installation costs by FHWA region. States were contacted, and responses were usually in the form of bid summaries that indicated considerable fluctuations because of the various lengths and other factors involved. To obtain better data for comparison purposes, a number of guardrail erectors were contacted for unit prices of a common length of installation. Except for significantly different values, which were excluded, Table 3 values are averages of all responses. The following average Region 6 values were used in the sample problems:

Type A	\$ 4.50/L.F.
B	6.00
C	5.00
D	6.25
E	6.10
G1	3.10
G2	4.35
G3	13.50
G4S	6.50
G4W	6.50
Thrie	7.50

TABLE 3. AVERAGE GUARDRAIL INSTALLATION COSTS (\$/L.F.)

FHWA Region	Guardrail Type				
	A	B	C	D	E
1	4.00	5.25	4.15	5.90	6.10
2	NA	NA	NA	5.30	6.90
3	3.75	5.20	4.00	5.00	6.30
4	NA	NA	6.65	NA	7.70
5	4.10	6.40	4.50	6.60	6.60
6	4.50	6.00	5.00	6.25	6.10
7	3.90	5.35	4.20	5.60	5.80
8	6.00	7.40	5.95	6.50	8.40
9	NA	6.30	5.60	7.75	NA

FHWA Region	Guardrail Type					
	G1	G2	G3	G4S	G4W	Thrie
1	3.10	5.40	14.10	6.30	NA	7.50
2	5.75	6.10	NA	6.60	5.50	NA
3	NA	3.75	NA	6.00	6.00	NA
4	NA	NA	NA	7.90	NA	NA
5	5.00	4.80	13.70	6.75	6.70	NA
6	3.10	4.35	13.50	6.50	6.50	7.50
7	2.75	3.80	12.80	6.40	5.70	NA
8	4.35	4.85	10.50	8.00	7.60	NA
9	5.00	NA	16.50	7.50	7.60	10.50

NA = Not Available

The variation of guardrail repair costs received from the states was even greater, ranging from 30 to 130 percent of the corresponding installation costs. For illustrative purposes, the cost of repair was set equal to the cost of installation.

With galvanized metal and treated wood, normal guardrail maintenance was considered negligible by the states. Thus, the yearly maintenance cost was set at zero in the sample problems. A salvage value of \$1.00 per foot was also used for each of the guardrail types.

Travel Delay

The following average values were used in the sample problems for travel delay factors:

Time to remove damaged vehicle	1.0 hour
Time to repair damaged guardrail	10.0 hours
Traffic delay cost	\$10/vehicle hour

Injury, Fatality, and Vehicle Costs

A direct cost approach was used for estimating injury and fatality costs (i.e., future productivity, property damage, and funeral costs were excluded). The following mid-1975 values were used:

Cost of injury	\$3,500 each
Cost of fatality	\$33,100 each

As indicated in Section III above, the occupant base used in the program can be changed to an accident base by modifying these costs.

The following average 1975 sticker prices were used for vehicle costs:

Cost of 2250-lb vehicle	\$3,200 each
Cost of 4500-lb vehicle	\$5,300 each

Economic Factors

To determine present worth state and societal costs, the following were used in the sample problems:

Guardrail service life	15 years
Current rate of interest	8 percent

VI. SAMPLE PROBLEMS

The input values shown in Section V above were used in several sample problems to illustrate the use of the cost-effectiveness model. This section discusses these uses.

Site Selection

The tables shown in Appendix A were developed for field use in site rankings of the guardrail types. For indexing purposes, the tables are numbered by (road type)-(pavement-to-guardrail distance)-(guardrail-to-obstacle distance). For example,

2R-5-4 = 2-lane rural road with 5 feet from pavement edge to guardrail and 4 feet from guardrail to obstacle

Road types in the tables include:

2R = 2-lane rural road

4R = 4-lane rural road (undivided)

D = all divided highways.

Note that the degree of curve is shown in the first column. Plus degrees indicate curvature to the left, and minus degrees indicate curvature to the right. A guardrail-to-obstacle distance of zero indicates an embankment type of hazard. Non-zero values indicate fixed object hazards. The tables can be used in the following ways:

- (1) For “quick and dirty” selections, the rankings shown can be used directly. Note that the selections can be made on the basis of state cost, societal cost, total cost, or benefit-to-cost ratio. The rankings are in the order of decreasing preference (the best is number 1 and the worst is number 11). The state cost criterion ranks the guardrails in the order of increasing state costs and hence indicates which system would be the cheapest to install. The societal cost criterion indicates the effectiveness of the guardrails in terms of increasing societal costs. However, neither of these criteria necessarily will show the most cost-effective system. Thus, cost-effective criteria of increasing total costs (state plus societal costs) and decreasing benefit-to-cost ratios are also included.

As an example, consider a 2-lane rural road turning to the left with a 4-degree curve. The guardrail is 6 feet from the edge of the pavement, and the obstacle is 4 feet back of the guardrail. From Table 2R-6-4 with +4 degrees of curve, the G2 guardrail is the most cost-effective system for either total cost or benefit-to-cost ratio. Suppose this system is not used in a particular state and it is desirable to select from types D, E, G4S, and G4W. The logical choice would be type D, which, though it ranks behind E in state cost, is better than all of the other three systems for societal cost, total cost, and benefit/cost ratio.

- (2) It must be realized that the selection criteria used above were based on the representative input values shown in Section V. If other values are used, the rankings will probably not be the same. However, costs associated with a guardrail installation are essentially linear with regard to AADT and exposure length. Thus, the values in the tables of Appendix A can be used to roughly determine values for certain other conditions. For example, consider Case 1 of Appendix C, with AADT = 5000, guardrail length = 500 ft, obstacle length = 400 ft, and curvature = 0 degrees. The values in this case could be approximated from Table 2R-3-2 (0° curve) as follows:

Societal cost with no guardrail:

$$\frac{\$710.68}{(\text{Table 2R-3-2})} \times \frac{4}{(\text{ratio of obstacle lengths})} \times \frac{5}{(\text{ratio of AADT's})} = \$14,214$$

State cost (for, say, guardrail type G4S):

$$\frac{\$618.48}{(\text{Table 2R-3-2})} \times \frac{5}{(\text{ratio of guardrail lengths})} = \$3,092$$

Societal cost (guardrail type G4S):

$$\frac{\$271.05}{(\text{Table 2R-3-2})} \times \frac{5}{(\text{ratio of guardrail lengths})} \times \frac{5}{(\text{ratio of AADT's})} = \$6,776$$

Total cost (guardrail type G4S):

$$\$3,092 + \$6,776 = \$9,868$$

Benefit-to-cost ratio:

$$(14,214 - 6,776)/3092 = 2.41$$

Note that the state cost could be estimated directly. For example, if the engineer knows that a G4S system (500 ft required) will cost \$5.00 per ft, end anchors (2 required) will cost \$200 each, and terminal sections (2 required) will cost \$400 each, the state cost is

$$500(5.00) + 200(2) + 400(2) = \$3,700.$$

In this sample problem, identical injury, fatality, and vehicle costs have been used for Table 2R-3-2 and Case 1 societal values. Such simple ratio manipulations of the Appendix A tables cannot be done for cases with different injury, fatality, and vehicle costs. Thus, the method is rather limited, and state computer runs for such cases are suggested.

Guardrail Placement

Consider the roadside condition shown in Figure 4. The COCOST program can be used to determine the optimum shoulder distance S to place the guardrail and the most cost-effective system to install. The first step involves setting the guardrail at various distances from the edge of the pavement. These are shown as shoulders in Table 4. Values of D and $D+W$ (see Figure 3) can then be established and the exposure lengths determined from Table 2. The results are shown in Table 4, from which it can be seen that the obstacle exposure length = 200 ft, and the guardrail lengths of need range from 311 ft to 222 ft for the various shoulder widths. Now assume that the AADT for the road is 5000. The next step is to run the COCOST program for each of the ten cases in Table 4. Outputs of these runs are shown in Appendix B. From the results, the most cost-effective systems for each shoulder width are extracted and tabulated in Table 5. Note that Type G2 at $S = 9$ ft gives the best results for both societal cost and total cost. The cheaper G1 system at $S = 4$ ft produces the best benefit-to-cost ratio.

FIGURE 4. SAMPLE GUARDRAIL PLACEMENT CASE

TABLE 4. DETERMINATION OF LENGTHS OF NEED

Shoulder (ft)	Obstacle Length	Upstream			Downstream			Length of Need
		D	D + W	X _U	D	D + W	X _D	
no guardrail	100	21	31	52	33	43	48	200
3	100	9	31	125	21	43	86	311
4	100	10	31	116	22	43	83	299
5	100	11	31	108	23	43	79	287
6	100	12	31	101	24	43	75	276
7	100	13	31	94	25	43	72	266
8	100	14	31	87	26	43	69	256
9	100	15	31	81	27	43	66	247
10	100	16	31	75	28	43	63	238
11	100	17	31	70	29	43	60	230
12	100	18	31	65	30	43	57	222

TABLE 5. RESULTS OF ANALYSIS

Shoulder (ft)	Most Effective System By:					
	Societal Cost		Total Cost		Benefit/Cost Ratio	
	Type	Value	Type	Value	Type	Value
3	G2	\$ 910	G1	\$1868	G1	2.96
4	G2	857	G1	1761	G1	3.16
5	G2	799	G2	1957	G1	2.96
6	G2	755	G2	1868	G2	2.52
7	G2	704	G2	1777	G2	2.66
8	G2	667	G2	1700	G2	2.80
9	G2	627	G2	1623	G2	2.94
10	G4S	1302	A	2422	G2	2.17
11	G4S	1223	A	2293	A	2.32
12	Thrie	1243	C	2576	A	2.04
Conclusion: Use Type G2 at 9 ft for best societal cost. Use Type G2 at 9 ft for best total cost. Use Type G1 at 4 ft for best benefit/cost ratio.						

Priority Ranking

Consider that the 20 different sites shown in Table 6 are to be ranked for appropriation of limited funding. Again, the COCOST program is run for each of the 20 cases. The outputs are shown in Appendix C. From the combined results, the 20 most cost-effective guardrail systems are selected for whichever evaluation criteria is preferred. The systems are then placed in the order of decreasing cost effectiveness. For example, from the results shown in Appendix C, Tables 7, 8, and 9 are prepared to establish priorities by societal cost, total cost, and benefit/cost ratio, respectively. The state cost for each case is listed in the tables, and a cumulative state cost is prepared to determine the cut-off point for available funds. For example, if \$25,000 is available and the total cost criterion is selected, it can be seen from Table 8 that only the top 12 cases can be funded.

Note from these examples that the computer program is simply used to determine the rankings and corresponding values for each case. The various results must then be manipulated and combined to determine the optimum guardrail placement or establish the priority ranking.

TABLE 6. SAMPLE CASES FOR SETTING PRIORITIES

Case	Roadway Type	Shoulder Width	Guardrail-to-Obstacle Distance	Degree of Curve	AADT
1	2-lane rural	3	2	0	5,000
2	2-lane rural	3	2	0	10,000
3	2-lane rural	3	4	0	5,000
4	2-lane rural	3	4	10	5,000
5	2-lane rural	3	4	-10	5,000
6	2-lane rural	3	6	0	5,000
7	2-lane rural	4	6	0	5,000
8	2-lane rural	5	6	0	5,000
9	2-lane rural	6	6	0	5,000
10	2-lane rural	7	6	0	5,000
11	2-lane rural	8	6	0	5,000
12	4-lane rural	4	8	0	10,000
13	4-lane rural	6	6	0	10,000
14	4-lane rural	8	4	0	10,000
15	4-lane rural	10	2	0	10,000
16	freeway	6	6	0	10,000
17	freeway	8	6	0	10,000
18	freeway	10	6	0	10,000
19	freeway	12	6	0	10,000
20	freeway	12	6	0	20,000

Use guardrail length = 500 ft for all cases; obstacle length = 400 ft for all cases.

VII. COMPUTER PROGRAM DESCRIPTIONS

SSCOST Program

The SSCOST program computes the state and societal costs for a specified guardrail type and roadway conditions. Program details are described in Appendix D. This section discusses program inputs and shows typical outputs.

Figure 5 is a worksheet that can be used to prepare SSCOST input. Figure 6 illustrates how the sets of input cards can be stacked for multiple runs. Set 1 corresponds to the data in the Figure 5 worksheet. The input values are entered as follows:

Card 1 (Format 10A8)

Columns 1-80. Enter appropriate title.

Card 2 (Format 8F10.0)

Columns 1-10. Enter highway type. Use

2.0 = 2-lane rural road

3.0 = 3-lane rural road

4.0 = 4-lane rural road

5.0 = 4-lane freeway

6.0 = 6-lane freeway

7.0 = 8-lane freeway

Columns 11-20. Enter guardrail type. Use

1.0 = Type A

2.0 = Type B

3.0 = Type C

4.0 = Type D

5.0 = Type E

6.0 = Type G1

7.0 = Type G2

8.0 = Type G3

9.0 = Type G4S

10.0 = Type G4W

11.0 = Type THRIE

Columns 21-30. Enter guardrail length of need in feet (see Section IV).

Columns 31-40. Enter AADT.

Columns 41-50. Enter fraction of traffic for 2250-lb vehicles.

Columns 51-60. Enter fraction of traffic for 4500-lb vehicles.

Columns 61-70. Enter highway division. Use

0.0 = undivided highway

1.0 = divided highway

Columns 71-80. Enter FHWA region number.

Card 3 (Format 5F10.0)

Columns 1-10. Enter left offset distance in feet (see Figure 7).

Columns 11-20. Enter right offset distance in feet (see Figure 7).

Columns 21-30. Enter degree of horizontal curve. Use

+ = curves bending to left

- = curves bending to right

Column	10	20	30	40	50	60	70	80
Card 1 Format (10A8):								
<u>2-Lane</u>	<u>Road, AADT=5,000, Guardrail Type A, Low Fatality Cost</u>

Service life	Interest rate	Total salvage value	Print flag					

FIGURE 5. SSCOST INPUT WORKSHEET

FIGURE 6. SSCOST INPUT DECK

FIGURE 7. OFFSET DISTANCE DEFINITIONS

Columns 31-40. Enter distance from guardrail face to obstacle in feet for fixed obstacles. If guardrail protects an embankment, enter 0.0.

Columns 41-50. Enter obstacle exposure length in feet (see Section IV).

Card 4 (Format 2F10.0)

Columns 1-10. Enter time to remove damaged vehicle in hours.

Columns 11-20. Enter time to repair damaged guardrail in hours.

Card 5 (Format 8F10.0)

Columns 1-10. Enter cost of injury in dollars.

Columns 11-20. Enter cost of fatality in dollars.

Columns 21-30. Enter cost of guardrail installation in dollars per foot. Include costs of end anchors and terminals. For example, if the guardrail system (500 ft required) costs \$5.00 per ft, end anchors (2 required) cost \$200 each, and terminal sections (2 required) cost \$400 each, enter

$$\frac{500(5.00) + 200(2) + 400(2)}{500} = \$7.40 \text{ per ft}$$

Columns 31-40. Enter cost of guardrail repair in dollars per ft.

Columns 41-50. Enter cost of guardrail maintenance in dollars per ft per year.

Columns 51-60. Enter cost of 2250-lb vehicle in dollars.

Columns 61-70. Enter cost of 4500-lb vehicle in dollars.

Columns 71-80. Enter unit cost of travel delay in dollars per hour per vehicle.

Card 6 (Format 4F10.0)

Columns 1-10. Enter service life in years.

Columns 11-20. Enter current interest rate in percent.

Columns 21-30. Enter estimate of total salvage value at end of service life in dollars.

Columns 31-40. Enter print flag. Use

0.0 for complete 6-page output (see below)

1.0 for printout of only "Sheet 6. Cost Summary" (see below)

Output sheets for the two sets of Figure 6 input data are shown in Figures 8 and 9, respectively. With a print flag of 0.0 in Columns 31-40 of Card 6, the output for Set 1 includes the six sheets shown in Figure 8. If all of this information is not desired, a print flag of 1.0 (see Set 2) will yield only the cost summary sheet shown in Figure 9.

COCOST Program

The COCOST program computes the associated costs and ranks the eleven guardrail types of Table 1 for specified roadway conditions. The ranking criteria include state cost, societal cost, total cost, and benefit-to-cost ratio. Program details are described in Appendix E. This section discusses program inputs and shows typical outputs.

Figure 10 is a worksheet that can be used to prepare COCOST input. Figure 11 illustrates how the sets of input cards can be stacked for multiple runs. Set 1 corresponds to the data in the Figure 10 worksheet. The input values are entered as follows:

Card 1 (Format 10A8)

Columns 1-80. Enter appropriate title.

FIGURE 10. COCOST INPUT WORKSHEET

FIGURE 11. COCOST INPUT DECK

Card 2 (Format 515). The various representative costs and input values discussed in Section V have been preset in the COCOST program. These values are shown within the starred lines on page 1 of the computer listing in Appendix E. For changes of these inputs to local values, the user can either (1) simply change the preset cards or (2) insert a change flag on Card 2. For the first option, use a blank card for Card 2. For the second option, use

- blank card for no changes in preset input values
- 1 in Column 5 for changes in traffic mix
(requires card 2a below)
- 1 in Column 10 for changes in guardrail costs
(requires cards 2b below)
- 1 in Column 15 for changes in travel delay
(requires card 2c below)
- 1 in Column 20 for changes in injury, fatality, or vehicle costs
(requires card 2d below)
- 1 in Column 25 for changes in service life or interest rate
(requires card 2e below)

These changes can be made singly or in combination (e.g., 1 in Column 10 and 1 in Column 15 indicate change cards 2b for guardrail costs and 2c for travel delay will follow).

Card 2a (Format 2F10.0). Include this card if 1 is punched in Column 5 of card 2.

Columns 1-10. Enter fraction of traffic for 2250-lb vehicles.

Columns 11-20. Enter fraction of traffic for 4500-lb vehicles.

Cards 2b (Format 8F10.0). Include these cards if 1 is punched in Column 10 of Card 2.

Columns 1-10, 11-20, 21-30, 31-40, 41-50, 51-60, 61-70, 71-80 (1st card). Enter installation costs in dollars per foot for guardrail types A, B, C, D, E, G1, G2, G3, respectively. Include costs of end anchors and terminals. For example, if a guardrail system (500 feet required) costs \$5.00 per ft, end anchors (2 required) cost \$200 each, and terminal sections (2 required) cost \$400 each, enter

$$\frac{500(5.00) + 200(2) + 400(2)}{500} = \$7.40 \text{ per ft.}$$

Columns 1-10, 11-20, 21-30 (2nd card). Enter installation costs in dollars per foot for guardrail types G4S, G4W, Thrie, respectively.

Note: Installation costs must be specified for each of the 11 guardrail types. If a state does not use certain types, high costs (say, \$100 per ft) can be used to force these types to the low end of the ranking scale.

Columns 31-40 (2nd card). Enter yearly maintenance cost for the guardrails in dollars per foot.

Note: The same unit maintenance cost is used for all of the guardrail types.

Columns 41-50 (2nd card). Enter estimate of unit salvage value in dollars per foot.

Note: The same unit salvage value is used for all of the guardrail types.

Card 2c (Format 3F10.0). Include this card if 1 is punched in Column 15 of card 2.

Columns 1-10. Enter time to remove damaged vehicle in hours.

- Columns 11-20. Enter time to repair damaged guardrail in hours.
 Columns 21-30. Enter unit cost of travel delay in dollars per hour per vehicle.

Card 2d (Format 4F10.0). Include this card if 1 is punched in Column 20 of card 2.

- Columns 1-10. Enter cost of injury in dollars.
 Columns 11-20. Enter cost of fatality in dollars.
 Columns 21-30. Enter cost of 2250-lb vehicle in dollars.
 Columns 31-40. Enter cost of 4500-lb vehicle in dollars.

Card 2e (Format 2F10.0). Include this card if 1 is punched in Column 25 of card 2.

- Columns 1-10. Enter service life in years.
 Columns 11-20. Enter current interest rate in percent.

NOTE: When changes are desired for a particular group of data, all of the quantities in that group must be specified. For example, in Set 2 of Figure 11, only the cost of injury and cost of fatality are changed on Card 2d from the previous run. However, the card must be completed. Thus, the 2250-lb vehicle cost and 4500-lb vehicle cost are also punched on the card even though they are not changed.

Card 3 (Format 7F10.0)

- Columns 1-10. Enter highway type. Use
 2.0 = 2-lane rural road
 3.0 = 3-lane rural road
 4.0 = 4-lane rural road
 5.0 = 4-lane freeway
 6.0 = 6-lane freeway
 7.0 = 8-lane freeway
 Columns 11-20. Enter highway division. Use
 0.0 = undivided highway
 1.0 = divided highway
 Columns 21-30. Enter left offset distance in feet (see Figure 7).
 Columns 31-40. Enter right offset distance in feet (see Figure 7).
 Columns 41-50. Enter degree of horizontal curve. Use
 + = curves bending to left
 - = curves bending to right

 Columns 51-60. Enter distance from guardrail face to obstacle in feet for fixed obstacle.
 If guardrail protects an embankment, enter 0.0.
 Columns 61-70. Enter distance from edge of pavement to guardrail face in feet.

Card 4 (Format 4F10.0)

- Columns 1-10. Enter guardrail length of need in feet (see Section IV).
 Columns 11-20. Enter obstacle exposure length in feet (see Section IV).
 Columns 21-30. Enter AADT.
 Columns 31-40. Enter final degree of curve if various degrees of curve are desired. For example, the tables of Appendix A were prepared by entering a starting value 10.0° in Columns 41-50 of Card 3 and a final value of -8.0 in this space. As shown in Appendix A, the curvature is reduced by 2° for each run until the final value is reached. For a single run, enter the same value in this space as specified in Columns 41-50 of Card 3.

The output results for Set 1 and Set 2 data in Figure 11 are shown in Figures 12 and 13, respectively. Note that the first output sheet lists input values for checking purposes. The second sheet lists the guardrail types in the order of decreasing preference (the best is number 1 and the worst is number 11) for the indicated criteria of state cost, societal cost, total cost, and benefit-to-cost ratio. It is the user's option to select the ranking criteria.

Note that the SSCOST runs of Figures 8 and 9 correspond to the COCOST runs of Figures 12 and 13. Thus, it can be seen, for example, that the values for state cost, societal cost, total cost, and benefit-to-cost ratio shown in Figure 12 for guardrail A are identical to the values shown in Figure 8. However, as noted earlier, the SSCOST run of Figure 8 is for the single guardrail types. Thus, it would be expected that the COCOST program will find more predominant use in cost-effectiveness analyses.

ADDENDUM

The impact speed distribution used in this report was estimated on the basis of historical data generated by Lampela and Yang (see Figure 6 and Reference 23 in Volume I, Technical Documentation), which involved approximately 1400 single-vehicle and 200 multiple-vehicle guardrail accidents in Michigan. Since the initial completion of this report, the Calspan study, involving 7,972 accidents on both freeway and non-freeway types of roads, has been reported (K. Perchonok, T. A. Ranney, A. S. Baum, D. F. Morris, and J. D. Eppich, "Methodology for Reducing the Hazardous Effects of Highway Features and Roadside Objects," CFSI Draft Report No. ZR-5564-V-1, Contract No. DOT-FH-11-8501, May 1978).

Figure 14 shows the distribution of impact speeds from these two studies. The crosshatched bars represent the Michigan results, used in this report, and the solid bars represent the Calspan results. It can be seen in the figure that significant differences exist between the two distributions. Because of this, FHWA expressed some concern that the slower Calspan speeds might affect predictions of this cost-effectiveness model. During the review, other concerns involved the assumed severity for fixed objects with no guardrail [see paragraph III(4) of this volume] and the guardrail severity level indicator, relating vehicle accelerations to occupant injury level (see Figure 9, page 51 of Volume I). It was suggested that sensitivity runs be made on the speed distribution and severity indices. Since these estimates were integral parts of the computer programs and not user specified, it was necessary to make minor program changes.

Sensitivity Analysis Results

Case 9 of Table 6, page 24 of this volume, was selected as the test case. This is a typical 2-lane rural roadway of 5000 ADT with a 6-foot shoulder and a 6-foot guardrail-to-obstacle distance. The computer output sheet for this case, taken from page C.10, is repeated in Figure 15. Since this run included the questioned no-guardrail severities of paragraph III(4), the first effort was to modify these severities. On further study of Reference 1 (page 47 of this volume), it was decided to use 0.04 fatality/0.45 injury/0.50 vehicle damage for embankments and 0.08 fatality/0.55 injury/0.50 vehicle damage for fixed objects. With these severities and the Michigan speed distribution, Figures 16, 17, and 18 show the results for severity index factors of 0.5, 1.0, and 2.0, respectively. Speed distributions from the Calspan study were next placed in the program. Figures 19, 20, and 21 show the results for the three severity index factors of 0.5, 1.0, and 2.0.

Discussion of Results

On comparing Figures 15 and 17, it can be seen that the reduction of the no-guardrail cost with the severity changes effectively reduces the benefit/cost ratios. The changes in guardrail societal costs from Figure 15 to Figure 17 were caused by the severity changes when the dynamic deflection of the guardrail exceeded the guardrail-to-obstacle distance [see paragraph III(4) on page 9]. It was felt that if a fatality had been predicted for the guardrail, it should not be reduced to 0.5 fatality/0.5 injury when the distance was exceeded. Thus, a severity of 1.0 fatality/0.0 injury/0.50 vehicle damage was used for this case. If the guardrail had not predicted a fatality, at least an injury should occur. Thus, a severity of 0.0 fatality/1.0 injury/0.50 vehicle damage was used. Note that societal costs for the stiffer guardrail types THRIE, A, C, B, and G4W were not changed by this modification. Values for the other types were reduced, notably the weak G1 system, which moved from position 11 to position 2 in the societal cost row.

On comparing Figures 16, 17, and 18 (or Figures 19, 20, and 21), it can be seen that some shifting in preference for the benefit/cost ratio row occurs. However, the most significant changes are

FIGURE 21. CALSPAN SPEED DISTRIBUTION WITH S.I. FACTOR = 2.0

the reductions in benefit/cost ratios to all-negative values at the S.I. factor of 2.0. With a doubling of the guardrail severity, these results were not unexpected.

On comparing Figures 17 and 20, it can be seen that both shifting in order of preference and changes in values occur with the change from the Michigan to the Calspan speed distribution. The changes in values were not unexpected, but it was hoped that the order of preference would not change. Unfortunately, this did occur.

By far the most significant feature of this analysis is the further reduction of the no-guardrail severities, resulting in the negative benefit/cost ratios. It was pointed out in Figures 1 of the Executive Summary, Volume I, and this volume of the report that a guardrail was warranted *a priori*, as determined by standard warranting procedures. The criterion for guardrail need in such procedures has classically been that the severity of impacting the guardrail is less than that of impacting the obstacle. Thus, negative benefit/cost ratios should never occur. Unfortunately, the question of what severity to presuppose for a guardrail warrant is nebulous at best.

The severity of general accident data that includes all impacts is inconsistent with this assumption of warranting procedures that the no-guardrail condition is more severe than that of the guardrail. However, if the accident experience at a site is known and the predicted severities of the guardrails in this study can be accepted, the model might well be applicable as a warranting tool. A negative benefit/cost ratio would imply that the guardrail is not warranted and would, indeed, make the condition worse. Ratios between zero and one would indicate some improvement in the condition but not enough to warrant the cost of the guardrail. Only conditions with ratios greater than unity would warrant further consideration.

Conclusions

- The cost-effectiveness model is sensitive (order of preference as well as corresponding values) to changes in the severity index.
- The model is sensitive to the change in speed distribution.

Recommendations

- If the Michigan speed distribution is representative and the severity assumptions of the report are acceptable, the results presented herein can be applied directly.
- If the Calspan speed distribution and the severity assumptions discussed above are more acceptable, regenerated site selection tables should be obtained from FHWA for use.
- If speed distribution, severity assumptions, or other values used in generating the site selection tables are unacceptable, the revised program should be requested from FHWA and applied to generate the user's own guardrail selection aids.

APPENDIX D

SSCOST PROGRAM LISTING

The listing of the SSCOST program follows. The program consists of a main program and twenty-three subroutines. Flow charts are not presented because it is considered that little can be gained by their use. The FORTRAN statements are arranged in logical groups with the function of each group indicated by comment statements. Also, the variable names have been selected to have mnemonic significance. Hence, the program logic can be followed as easily from the FORTRAN listing as from a flow chart. Brief descriptions of the functions of the main program and various subroutines follow. A dictionary of variable names is provided later in Appendix F.

MAIN Program

The main program maintains overall control of the execution. It first calls in the input data and performs the necessary initializations. Probabilities for the various impact conditions are then computed by calling the PROBAB subroutine, and the number of yearly impacts are calculated. The SEVER subroutines are then called to determine the accident severities, followed by calling TRADEL to compute the travel delay time. Finally, costs are computed, including the CNGRD subroutine to compute societal cost if no guardrail is installed. Program control then transfers back to the beginning of the program for the next set of input data. As shown in Figure 6, as many input data sets can be stacked as desired. Program termination is effected by encountering an end-of-file.

ASEVER, BSEVER, CSEVER, DSEVER, ESEVER, G1SEV, G2SEV, G3SEV, G4SSEV, G4WSEV, and THRIE Subroutines

As established from the BARRIER VII runs, these SEVER subroutines include the 24 accident severities for the category impact conditions (see Table 5 of Volume I. Technical Documentation). If sufficient accident data were obtained, the data cards in these subroutines can be changed to reflect these actual data instead of the extrapolated simulation results.

CNGRD Subroutine

This subroutine computes the estimate of societal cost with no installation of guardrail. As indicated by the comment cards, included are computations of probabilities, number of yearly impacts, accident severities, travel delay, and associated costs.

INJURY Subroutine

The SEVER data statements include maximum 50-ms averages of lateral and longitudinal vehicle accelerations. This subroutine converts these accelerations to injury classifications according to the guardrail severity level indicator (see Figure 9 of Volume I).

OBSTA Subroutine

This subroutine changes the injury classifications when the guardrail deflects past the obstacle. For a fixed obstacle, severities are set at 0.5 injury, 0.5 fatality, and 0.5 vehicle damage when the guardrail deforms more than the guardrail-to-obstacle distance. For embankments, the guardrail-to-obstacle distance is set at 5 feet.

PROBAB Subroutine

This subroutine calculates the combined probabilities of impacts for specified offset distances and category values of vehicle speeds and impact angles (see Figures 5 and 6 and Table 4 of Volume I). The PROBO subroutine is called for the probabilities of the impact angles at the category speeds.

PROBO Subroutine

This subroutine calculates the distribution of category impact angles for a specified vehicle speed, offset distance, and degree of horizontal curvature. The mathematical basis for the subroutine is discussed in Appendix D of Volume I. The subroutine PROBN is called from this subroutine.

PROBN Subroutine

This subroutine calculates the normal distribution probabilities for a specified impact angle.

TRADEL Subroutine

As formulated in Appendix E of Volume I, this subroutine calculates the travel delay for specified values of AADT, highway type, and times to remove the damaged vehicle and repair the damaged guardrail. The subroutines VEL50, VEL60, ACCDT, and REPAIR are called from this subroutine.

ACCDT Subroutine

This subroutine computes the travel delay caused by blockage of the damaged vehicle. Formulation of the problem is discussed in Appendix E of Volume I.

REPAIR Subroutine

As formulated in Appendix E of Volume I, this subroutine calculates the travel delay caused by repair of the damaged guardrail.

VEL60 Subroutine

For a specified volume-to-capacity ratio, this subroutine computes the vehicle operating speed for the 60 mph AHS curve in Figure E.2 of Volume I.

VEL50 Subroutine

For a specified volume-to-capacity ratio, this subroutine computes the vehicle operating speed for the 50 mph AHS curve in Figure E.2 of Volume I.

VELF Subroutine

For a specified volume-to-capacity ratio, this subroutine computes the vehicle operating speed for the Level F curve in Figure E.2 of Volume I.

Operating Characteristics

The CDC-6500 version of the SSCOST program requires a 60k core. For four sets of input data, including the two sets shown in Figure 6, the run required 8.45 seconds of CP time and 28.38 seconds of IO time. For the IBM-370 version, a 360k core was required, and 30.60 seconds of CPU time were used. Costs for the CDC and IBM runs were approximately \$10.75 and \$17.70, respectively.

APPENDIX E

COCOST PROGRAM LISTING

The listing of the COCOST program follows. The program consists of a main program and twenty-three subroutines. Since the subroutines are all identical to those used in the SSCOST program, the reader is referred to Appendix D for brief descriptions of their functions. Description of the main program function follows. A dictionary of variable names is provided later in Appendix F.

MAIN Program

The main program maintains overall control of the execution. Note on page 1 of the listing that the various representative costs and input values are preset within the starred lines. These cards can be changed to local values if desired. Changes for these values, or changes between consecutive runs, can also be effected by the KARD flags described in the starred box of page 2.

After calling in the input data and performing the necessary initializations, the program calls the CNGRD, PROBAB, and TRADEL to compute the societal cost with no guardrail, probabilities of impacts for the category vehicle speeds and impact angles, and travel delay. The major difference between the SSCOST and this program then occurs. Rather than a single pass through the SEVER subroutines with a specified guardrail type, this program loops the subroutines to obtain accident severities for each of the eleven guardrail types and saves the results. These results are then used to establish the rankings by state costs, societal costs, total costs, and benefit-to-cost ratios. Finally, the program control is transferred back to the beginning of the program for the next set of input data. As shown in Figure 11, as many input data sets can be stacked as desired. Program termination is effected by encountering an end-of-file.

Operating Characteristics

The CDC-6500 version of the COCOST program requires a 60k core. For three sets of input data, including the two sets shown in Figure 11, the run required 7.88 seconds of CP time and 27.65 seconds of IO time. For the IBM-370 version, a 360k core was required, and 27.93 seconds of CPU time were used. Costs for the CDC and IBM runs were approximately \$10.60 and \$16.00, respectively.

APPENDIX F

DICTIONARY OF VARIABLE NAMES

This appendix lists the major variables in the SSCOST and COCOST programs and explains their meaning.

Input Variables (arranged alphabetically)

Variable Name	Quantity Represented
AADT	Annual average daily traffic
C22	Cost of a 2250-lb vehicle
C45	Cost of a 4500-lb vehicle
CFAT	Cost of a fatality in dollars
CI	Cost of guardrail installation in dollars per ft
CINJ	Cost of an injury in dollars
CMA	Yearly cost of guardrail normal maintenance in dollars per ft
CRE	Cost of guardrail repair in dollars per ft
CTD	Cost of travel delay in dollars per hour per vehicle
DEG	Degree of horizontal curve. Used for initial degree of curve with multiple runs with varying degrees of curve
DGF	Final degree of curve for multiple runs with varying degrees of curve. DGF = DEG for single runs
FHWA	FHWA region
GL	Guardrail length of need in ft
GT	Guardrail type
HD	Highway division
HT	Highway type
KARD(5)	Flags for changes in input values
OBL	Obstacle exposure length in ft

Variable Name	Quantity Represented
OBS	Guardrail-to-obstacle distance in ft
OFL	Left offset distance in ft
OFR	Right offset distance in ft
PRINT	Print flag
RI	Current interest rate in percent
SAL	Unit salvage value for guardrail in dollars per ft
SHOL	Shoulder width (distance from pavement edge to guardrail) in ft
SL	Guardrail service life in years
SLV	Total salvage value of guardrail in dollars
T22	Fraction of traffic for 2250-lb vehicles
T45	Fraction of traffic for 4500-lb vehicles
TRG	Time to repair damaged guardrail in hours
TRV	Time to remove damaged vehicle in hours

DIMENSION Statements (arranged alphabetically)

ANG(4)	Category angles 7°, 15°, 25°, 30°
BC(11)	Benefit/cost ratios for guardrail types (destroyed in ranking process)
CG(11)	State costs for guardrail types (destroyed in ranking process)
CI(11)	Guardrail installation costs in dollars per ft
CS(11)	Societal costs for guardrail types (destroyed in ranking process)
CTOT(11)	Total costs for guardrail types (destroyed in ranking process)
ITYPE(12)	Indexes for guardrail types in DATA statement
JB(11)	Indexes for guardrail types as ranked by benefit/cost ratios
JG(11)	Indexes for guardrail types as ranked by state costs
JS(11)	Indexes for guardrail types as ranked by societal costs

Variable Name	Quantity Represented
JT(11)	Indexes for guardrail types as ranked by total costs
KARD(5)	Flags for changes in input values
SB(11)	Benefit/cost ratios for guardrail types (saved for printout)
SG(11)	State costs for guardrail types (saved for printout)
SS(11)	Societal costs for guardrail types (saved for printout)
ST(11)	Total costs for guardrail types (saved for printout)
TITLE(10)	Title

Common Blocks CST (arranged as listed in programs)

H22(12)	Number of 2250-lb vehicle hits for each of 12 impact conditions
H45(12)	Number of 4500-lb vehicle hits for each of 12 impact conditions
E22	Number of encroachments for 2250-lb vehicles
E45	Number of encroachments for 4500-lb vehicles
TOT(8)	Totals of injuries, fatalities, guardrail damage, and vehicle damage for 2250-lb and 4500-lb vehicles
PRB(4)	Probabilities for accident blocking the highway (see Table E.1 of Volume I)
TNH(12)	Total number of hits for each of 12 impact conditions
TDL(12)	Total traffic delay for each of 12 impact conditions
COST(12)	Costs for (1) injuries, (2) fatalities, (3) guardrail repair, (4) 2250-lb vehicle damage, (5) 4500-lb vehicle damage, (6) traffic delay, (7) guardrail installation, (8) guardrail maintenance, (9) salvage value, (10) total accident damage, (11) present worth traffic delay, (12) unused
EFP, EFA	Economic factors for present values of (1) \$1 at compound interest and (2) annuity of \$1
CINJ, CFAT, C22, C45, CTD, CNG	Costs for injury, fatality, 2250-lb vehicles, 4500-lb vehicles, travel delay, and societal cost for no guardrail

Common Blocks PRO (arranged as listed in programs)

Variable Name	Quantity Represented
V	Velocity in mph
TL	Total offset distance in ft
DEG	Degree of horizontal curve
P7, P15, P25, P30	Probabilities of 7°, 15°, 25°, and 30° impacts
THETA	95 percentile impact angle (see Appendix D of Volume I)
IPASS	Pass number for probability calculation (1 = left offset, 2 = right offset)
HD	Highway division (0 = undivided, 1 = divided)
ANGL(2,3)	95 percentile impact angles for (left, right) at (30, 50, and 70 mph) speeds
PB(2,12)	Probabilities of hits for (left, right) for each of 12 impact conditions
OFL	Offset distance on left
OFR	Offset distance on right

Common Blocks TRA (arranged as listed in programs)

AHT	Average hourly traffic
CAB	Capacity in Section ab (see Figure E.1 of Volume I)
CBC	Capacity in Section bc (see Figure E.1 of Volume I)
SAQ	Operating speed in Section aq (see Figure E.1 of Volume I)
DVAQ	Vehicle density in Section aq
AADT	Annual average daily traffic
IHT	Highway type
TRV	Time to remove damaged vehicle
TRG	Time to repair damaged guardrail
TB	Traffic delay caused by accident blockage

<u>Variable Name</u>	<u>Quantity Represented</u>
TM	Traffic delay caused by guardrail repair congestion
Common Blocks SEV (arranged as listed in programs)	
W(24)	Number of injuries for each of 24 impact conditions
F(24)	Number of fatalities for each of 24 impact conditions
GD(24)	Guardrail damage for each of 24 impact conditions
VD(24)	Vehicle damage for each of 24 impact conditions
DEF(24)	Maximum dynamic deflection of guardrail for each 24 impact conditions
OBS	Guardrail-to-obstacle distance in ft

FEDERALLY COORDINATED PROGRAM OF HIGHWAY RESEARCH AND DEVELOPMENT (FCP)

The Offices of Research and Development of the Federal Highway Administration are responsible for a broad program of research with resources including its own staff, contract programs, and a Federal-Aid program which is conducted by or through the State highway departments and which also finances the National Cooperative Highway Research Program managed by the Transportation Research Board. The Federally Coordinated Program of Highway Research and Development (FCP) is a carefully selected group of projects aimed at urgent, national problems, which concentrates these resources on these problems to obtain timely solutions. Virtually all of the available funds and staff resources are a part of the FCP, together with as much of the Federal-aid research funds of the States and the NCHRP resources as the States agree to devote to these projects.*

FCP Category Descriptions

1. Improved Highway Design and Operation for Safety

Safety R&D addresses problems connected with the responsibilities of the Federal Highway Administration under the Highway Safety Act and includes investigation of appropriate design standards, roadside hardware, signing, and physical and scientific data for the formulation of improved safety regulations.

2. Reduction of Traffic Congestion and Improved Operational Efficiency

Traffic R&D is concerned with increasing the operational efficiency of existing highways by advancing technology, by improving designs for existing as well as new facilities, and by keeping the demand-capacity relationship in better balance through traffic management techniques such as bus and carpool preferential treatment, motorist information, and rerouting of traffic.

3. Environmental Considerations in Highway Design, Location, Construction, and Operation

Environmental R&D is directed toward identifying and evaluating highway elements which affect the quality of the human environment. The ultimate goals are reduction of adverse highway and traffic impacts, and protection and enhancement of the environment.

4. Improved Materials Utilization and Durability

Materials R&D is concerned with expanding the knowledge of materials properties and technology to fully utilize available naturally occurring materials, to develop extender or substitute materials for materials in short supply, and to devise procedures for converting industrial and other wastes into useful highway products. These activities are all directed toward the common goals of lowering the cost of highway construction and extending the period of maintenance-free operation.

5. Improved Design to Reduce Costs, Extend Life Expectancy, and Insure Structural Safety

Structural R&D is concerned with furthering the latest technological advances in structural designs, fabrication processes, and construction techniques, to provide safe, efficient highways at reasonable cost.

6. Prototype Development and Implementation of Research

This category is concerned with developing and transferring research and technology into practice, or, as it has been commonly identified, "technology transfer."

7. Improved Technology for Highway Maintenance

Maintenance R&D objectives include the development and application of new technology to improve management, to augment the utilization of resources, and to increase operational efficiency and safety in the maintenance of highway facilities.

* The complete 7-volume official statement of the FCP is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161 (Order No. PB 242057, price \$45 postpaid). Single copies of the introductory volume are obtainable without charge from Program Analysis (HRD-2), Offices of Research and Development, Federal Highway Administration, Washington, D.C. 20590.
