SECTION 1.0
PURPOSE AND INTRODUCTION

PURPOSE

The main purpose of this test was to obtain side crush measurements for improvement of computer simulation models in one of a fleet of vehicles. The vehicle was tested using conditions not currently contained in a Federal Motor Vehicle Safety Standard.

INTRODUCTION

A stationary 1980 Chevrolet Citation 4-Door Hatchback was impacted on the left and right side by a Moving Rigid Barrier (MRB) on March 26, 1986.

Test #1: The MRB was to be towed into the stationary Chevrolet Citation at 18.5 mph, and the intended contact point of the MRB longitudinal centerline was to be -8.1 inches (rearward) from the center of gravity of the Chevrolet Citation. The angle of the MRB was 90° counter clockwise with respect to the longitudinal axis of the struck vehicle. The actual test speed was 18.6 mph and the actual contact point was -8.6 inches (rearward) from the center of gravity of the Chevrolet Citation.

Test #2: The MRB was to be towed into the stationary Chevrolet Citation at 46.5 mph, and the intended contact point of the MRB longitudinal centerline was to be -8.1 inches (rearward) from the center of gravity of the Chevrolet Citation. The angle of the MRB was 90° clockwise with respect to the longitudinal axis of the struck vehicle. The actual speed was 46.6 mph and the actual contact point was -8.1 inches (rearward) from the center of gravity of the Chevrolet Citation.

Section 2 contains General Test and Vehicle Parameter Data. Section 3 contains data required by R & D. Appendix A & B contains pre-test and post-test vehicle photographs. Appendix C & D contains Data Plots.
