SECTION 1.0
PURPOSE AND TEST SUMMARY

The purpose of the four 270° contoured moving barrier impact tests was for research and development in support of the CRASH III damage algorithm reformulation.

The 1985 Chrysler LeBaron was equipped with a 2.2 liter, 4-cylinder, transverse, gas engine with a 3-speed automatic transmission. The intended total test weight of the vehicle was 2620 pounds. The actual weight was 2620 pounds.

The contoured moving barrier actual weight was 2652 pounds, frontal width was 62.5 inches, hood height was 30.0 inches, bumper width was 6.0 inches, and center line bumper height to ground was 17 inches. The contoured moving barrier was intended to impact the driver's side of the vehicle at 270°. The leading edge of the contact was to be 25.6 inches forward of the vehicle's center of gravity.

The crash event was recorded by three (3) high-speed cameras.

DEFINITION OF MEASUREMENTS

C1, C2, C3, C4, C5, C6 = crush at 6 points for major (bumper height) penetration.

S1, S2, S3, S4, S5, S6 = crush at 6 points for stiffer member (sill height) penetration.

F = free space distance, measured on the undeformed side of the car, between the surface at major penetration (bumper height) and minor penetration (sill height) locations.

X1, X2 = distances between points C1 and C6, respectively and the vertical plane passing through points at the extreme ends of the car which lay in the plane of the car side before deformation.

B1 = the offset of the trunk centerline from the original body center line.

B2 = the offset of the hood centerline from the original body center line.

If a door hinge or latch or pillar did not fail then:

$$\text{Average Crush} = \text{Bumper Height Crush} + \frac{X1 + X2}{2}$$

If a door hinge or latch or pillar did fail then:

$$\text{Average Crush} = \text{Bumper Height Crush} + \frac{\text{Sill Height Crush as Corrected}}{2} + \frac{X1 + X2}{2}$$

Sill height crush as corrected = Sill Height Crush as measured free space.

TEST ANOMALIES

Noise in the form of spikes was observed in the plots for the contact switches OTH1, OTH2, OTH3, OTH4. * The switches were used to record the time of vehicle contact with the moving barrier, as well as the time of vehicle separation from the barrier. The switches were damaged by the crush of the moving contoured barrier against the vehicle. The switches were replaced following each test which contained spikes. This is not the standard use of such switches.

*CONTACT SWITCH MNEMONICS:

OTH1 Barrier contact switch - Left
OTH2 Barrier contact switch - Center #1
OTH3 Barrier contact switch - Center #2
OTH4 Barrier contact switch - Right

TEST NO. 890302-1

The entire data was lost due to a fuse blow out in the moving barrier multiplex box. The data are the following:

BCGXG, Contoured moving barrier center of gravity X-axis accelerometer
BCGXV, Contoured moving barrier center of gravity X-axis velocity

OTH1 Barrier contact switch - left
OTH2 Barrier contact switch - Center #1
OTH3 Barrier contact switch - Center #2
OTH4 Barrier contact switch - Right

*Identify the plane at which the C-measurements are taken (e.g., at bumper, at sill, above sill, at beltline, etc.) or label adjustments (e.g., free space).

Free space value is defined as the distance between the baseline and the original body contour taken at the individual C locations. This may include the following: bumper lead, bumper taper, side protrusion, side taper, etc. Record the value for each C-measurement and maximum crush.

**Measure and document on the vehicle diagram the beginning or end of the direct damage width and field L (e.g., side damage with respect to undamaged axle.)

***Measure and document on the vehicle diagram the location of the maximum crush.

NOTE: Use as many lines/columns as necessary to describe each damage profile.

	Average Crush			140.8	0.0	7.8	32.0	33.8	19.8	0.0	-12.5

Bumper height as corrected = Bumper height as measured - free space

Free Space = -0.25

Average crush = Bumper height as corrected + $\frac{X1 + X2}{2}$

*Identify the plane at which the C-measurements are taken (e.g., at bumper, at sill, above sill, at beltline, etc.) or label adjustments (e.g., free space).

Free space value is defined as the distance between the baseline and the original body contour taken at the individual C locations. This may include the following: bumper lead, bumper taper, side protrusion, side taper, etc. Record the value for each C-measurement and maximum crush.

**Measure and document on the vehicle diagram the beginning or end of the direct damage width and field L (e.g., side damage with respect to undamaged axle.)

***Measure and document on the vehicle diagram the location of the maximum crush.

NOTE: Use as many lines/columns as necessary to describe each damage profile.
