# Heavy and Overweight Vehicle Brake Testing: Combination Six-Axle Final Report 

## FOREWORD

The Federal Motor Carrier Safety Administration (FMCSA), in coordination with the Federal Highway Administration (FHWA), sponsored the Heavy and Overweight Vehicle Brake Testing (HOVBT) program in order to provide information about the effect of gross combination vehicle weight on braking performance. While the Federal Motor Carrier Safety Regulations (FMCSRs) limit the number of braking system defects that may exist for a vehicle to be allowed to operate on the roadways for given weight limits, the HOVBT program seeks to provide relevant stopping distance data to those considering the effect of increased cargo loads for various levels of brake defects.

This document serves as the final report for the six-axle commercial motor vehicle (CMV) research associated with this program. This phase of testing was conducted on a six-axle combination vehicle, with testing conducted both for brakes meeting the Federal Motor Vehicle Safety Standard (FMVSS) 121 reduced stopping distance requirements required by the National Highway Traffic Safety Administration (NHTSA) in the July 27, 2009 final rule and for brake components used prior to the enactment of this rule. This report provides a summary of the testing activities, the results of various analyses of the data, and recommendations for future research. Stopping tests, constant-brake-application-pressure tests, and performance-based brake tests (PBBTs) were performed on a six-axle CMV following a complete brake rebuild. Tests were performed for various brake conditions, weights, and initial speeds. Analysis of the stopping test data showed the stopping distance increasing with load in most cases (as expected) and showed more braking force being generated by the drive axle brakes than the trailer axle brakes, consistent with previous research. The relationship between initial speed, brake application, stopping distance, and load was found to be highly linear in the low to mid-pressure range, providing the basis for a proposed real-time onboard dynamic brake assessment. This research also provided valuable information regarding areas in which future research might focus.

## NOTICE

This document is disseminated under the sponsorship of the U.S. Department of Transportation (USDOT) in the interest of information exchange. The U.S. Government assumes no liability for the use of the information contained in this document. The contents of this report reflect the views of the contractor, who is responsible for the accuracy of the data presented herein. The contents do not necessarily reflect the official policy of the USDOT. This report does not constitute a standard, specification, or regulation.

The U.S. Government does not endorse products or manufacturers named herein. Trademarks or manufacturers' names appear in this report only because they are considered essential to the objective of this report.

## QUALITY ASSURANCE STATEMENT

FMCSA provides high-quality information to serve government, industry, and the public in a manner that promotes public understanding. Standards and policies are used to ensure and maximize the quality, objectivity, utility, and integrity of its information. FMCSA periodically reviews quality issues and adjusts its programs and processes to ensure continuous quality improvement.

## EXECUTIVE SUMMARY

The Federal Motor Carrier Safety Administration (FMCSA), in coordination with the Federal Highway Administration (FHWA), sponsored the Heavy and Overweight Vehicle Brake Testing (HOVBT) program in order to provide information about the effect of gross vehicle weight (GVW) on braking performance. The examination of the effect of brake defects on brake performance for increased vehicle weight is important because the Federal Motor Carrier Safety Regulations (FMCSRs) limit the number of braking system defects that may exist for a vehicle to be allowed to operate on the roadways. The HOVBT program seeks to provide relevant stopping distance data for increasing cargo loads at various levels of brake defects.

This phase of testing was conducted on a six-axle combination vehicle with two different tractor conditions; one with brake components used by the tractor manufacturer to comply with the Federal Motor Vehicle Safety Standard (FMVSS) 121 reduced stopping distance requirements required by the National Highway Traffic Safety Administration (NHTSA) in the July 27, 2009 final rule, and one with brake components used by the manufacturer prior to the enactment of the FMVSS-121 reduced stopping distance requirements. This report provides a summary of the testing activities, the results of various analyses of the data, and recommendations for future research. Following a complete brake rebuild, instrumentation, and brake burnish, service brake tests were performed on the test vehicle by applying full system brake application pressure from initial speeds of 20 and $60 \mathrm{mi} / \mathrm{h}$ until the vehicle came to a stop. These were conducted for various brake conditions at the following GVWs: $80,000,88,000,97,000,112,000$, and 132,000 lb. The 97,000-lb GVWs included both balanced and unbalanced loads (where the load on the trailer was biased to increase the load on the drive axle of the tractor). Similar constant-pressure stops were performed on the full tractor-trailer combination vehicle with various brake application pressures ( 15 pounds per square inch [psi], $25 \mathrm{psi}, 35 \mathrm{psi}, 45 \mathrm{psi}, 55 \mathrm{psi}$ ) from 20, 40, and $60 \mathrm{mi} / \mathrm{h}$ for three loading conditions (GVWs): 80,000 lb; 88,000 lb ; and 97,000 lb (balanced). For both types of stopping tests, the condition of the braking system was varied by introducing a variety of brake defects on axle and wheel end combinations by making those brakes inoperative. In addition to the stopping tests, performance-based brake tests (PBBTs) were conducted for the various loading and brake conditions.

Analysis of the stopping test data showed the stopping distance to increase with load in most cases (as expected) and also showed that more braking force was generated by the drive axle brakes, as measured in relative stopping distance length, than the trailer axle brakes-an observation consistent with earlier five-axle research. The linear relationships between initial speed, brake application, stopping distance, and load was used to develop a model relating these parameters to one another, allowing predictions to be made about any one of these parameters provided that the others were known.

This research also provided valuable information regarding areas in which future research might focus, including the need for further data collection to develop and test an onboard brake assessment algorithm and similar stopping distance tests of vehicles with other body types and trailer configurations.

## 1. INTRODUCTION

### 1.1 BACKGROUND AND PROGRAM OVERVIEW

Commercial trucks normally travel at or below the maximum weight allowed by the Federal Highway Administration (FHWA) Bridge Formula on the interstate highways. Many states allow commercial trucks to operate on state roads and highways at weights significantly higher than that allowed under the FHWA Bridge Formula. The Federal Motor Carrier Safety Administration (FMCSA) and FHWA are interested in gathering real-world brake performance and stopping distance test data on vehicles representative of current in-use commercial motor vehicles (CMVs) that are operating at Bridge Formula weights, weights that are grandfathered under state commercial truck weight provisions on non-interstate highways, and permitted weights.

The Heavy and Overweight Vehicle Brake Testing (HOVBT) program was designed to provide information about the effect of gross vehicle weight (GVW) on braking performance. Because the Federal Motor Carrier Safety Regulations (FMCSRs) limit the number of braking system defects that may exist for a vehicle to be allowed to operate on the roadways, the effect of brake defects on brake performance for increased loads was also examined. The HOVBT program seeks to provide relevant information to policy makers responsible for establishing load limits, beginning with providing test data for the combination tractor/trailer configuration.

### 1.2 FIVE-AXLE TESTING

The first study in the HOVBT program involved a five-axle combination vehicle fitted with brakes meeting the reduced stopping distance (RSD) requirement rulemaking. This report provides a summary of the testing activities, the results of various analyses of the data, and recommendations for future research. Following a complete brake rebuild, instrumentation, and brake burnish, stopping tests were performed from 20 and 40 miles per hour mi/h with various brake application pressures ( 15 pounds per square inch [psi], $25 \mathrm{psi}, 35 \mathrm{psi}, 45 \mathrm{psi}, 55 \mathrm{psi}$, and full system pressure). These tests were conducted for various brake conditions at the following GVWs: 60,000, 80,000, 91,000, 97,000, 106,000, and 116,000 lb. The 80,000-lb GVWs included both balanced and unbalanced loads. The condition of the braking system was also varied. To introduce these defects, brakes (none, forward drive axle, or rear trailer axle) were made inoperative. In addition to the stopping tests, performance-based brake tests were conducted for the various loading and brake conditions.

Analysis of the stopping test data showed the stopping distance to increase with load (as expected) and also showed that more braking force was generated by the drive axle brakes than the trailer axle brakes. The constant-pressure stopping test data revealed a linear relationship between brake application pressure and deceleration and was used to develop an algorithm to normalize stopping data for weight and initial speed.

Additional, future five-axle combination vehicle testing may involve standard (non-RSD) brakes and/or low-rolling-resistance tires.

### 1.3 SIX-AXLE TESTING

This report outlines the testing and analysis activities conducted to support follow-on six-axle vehicle research. The first part of the six-axle testing was conducted in 2013 and involved a combination vehicle equipped with RSD brakes. Similar to the five-axle research, tests for this phase of the research effort included PBBT tests, service brake stops, and constant-pressure stops. FMVSS-121-protocol tests were performed, and additional brake defect conditions were tested.

Oak Ridge National Laboratory (ORNL) gathered the required stopping distance data via a subcontract to Link Commercial Vehicle Testing (East Liberty, OH) and analyzed the data to provide background information regarding the braking capability of air-braked commercial combination vehicles operating at maximum weight allowed by FHWA Bridge Formula and in heavy weight conditions under various levels of brake performance. This testing was conducted on a vehicle with larger tractor brakes meeting the RSD requirement rulemaking reflected in Federal Motor Vehicle Safety Standard (FMVSS) 121 (49 CFR Part 571). A similar set of tests were repeated on the same vehicle fitted instead with non-RSD tractor brake components. This report provides a summary of the testing activities, the results of various analyses of the data, and recommendations for future research.

## 2. TEST SETUP

This section provides information regarding the test vehicle and various tests performed as part of the HOVBT effort.

### 2.1 DESCRIPTION OF TEST VEHICLE

The test vehicle was a 2013 model year Volvo VNL tractor with a48-ft Wabash flatbed trailer in a three-axle configuration. The specifications for the tractor are shown in Table 1, Table 2, Table 3, Table 4, and Table 5. The trailer specifications are shown in Table 6, Table 7, and Table 8. The combination tractor/trailer is shown in the 80,000-lb GVW balanced load configuration in Figure 1.

Table 1. General tractor information.

| Manufacturer | Type | Model Number | Date of <br> Manufacture | Vehicle Identification <br> Number (VIN) | GVWR | Number <br> of Axles |

Figure 1. Photo. Test vehicle in 80,000-lb GVW configuration.
Source: Oak Ridge National Laboratory.
The test tractor was first outfitted with the larger front brakes, complying with the RSD requirements for three-axle tractors with a GVWR of 59,600 lb or less manufactured on or after August 1, 2011. Tests were then repeated with the tractor axle brake components replaced with non-RSD brake drums and brake pad components.

### 2.2 BRAKE REBUILD AND INSTRUMENTATION

In preparation for testing, a complete foundation brake rebuild was performed. Linings, drums, anchor pins, anchor pin bushings, brake shoe rollers, and return springs were replaced. Other foundation brake components were found to be in acceptable condition and were not replaced. The tires on the test vehicle were also replaced as the originals showed excessive wear. Prior to testing each set of brakes (RSD and non-RSD), a 500-stop burnish was performed on the new brake system in accordance with the FMVSS-121 procedure.

The process of rebuilding and burnishing ensured the effects of loading, brake condition, and brake application pressure on brake performance examined in this study were not compounded by performance degradation introduced by any braking system components that were worn, faulty, or not properly broken in.

In preparation of the various tests performed as part of this research, the test vehicle was instrumented with sensors to collect speed, brake application pressure, and related data. A complete list of all the signals collected appears in Section 3.1. In addition, a pressure regulator was installed near the treadle valve to allow the operator to provide a precise brake application pressure to the primary and secondary pressure circuits.

### 2.3 TYPES OF TESTS

The following tests were performed for various brake conditions at the following approximate GVWs: $80,000 \mathrm{lb}, 88,000 \mathrm{lb}, 97,000 \mathrm{lb}, 112,000 \mathrm{lb}$, and $132,000 \mathrm{lb}$. The $97,000-\mathrm{lb}$ GVW loading conditions included both balanced and unbalanced loads. The condition of the braking system was also varied. To introduce these defects, various combinations of brakes were made inoperative rather than changing adjustment-not only is this the easiest to quantify (in terms of brake degradation), but it is the worst-case scenario for a brake defect. The following brake conditions were tested:

- Fully-functioning braking system.
- Disabled tractor drive brakes on one axle (front drive axle).
- Disabled trailer brakes on one axle (middle trailer axle).
- Disabled tractor brakes on three wheel ends (front drive axle and right side of rear drive axle.)
- Disabled trailer brakes on three wheel ends (middle trailer axle and right side of rear trailer axle).
- Disabled steer axle brakes.

For most test scenarios, the brakes involved in ABS actuation remained enabled where possible. A few extra stopping tests were performed with the ABS disabled as part of the non-RSD brake testing. All stopping tests were performed along a straight-line path.

### 2.3.1 Service Brake Stops

Service brake stops were performed by bringing the test vehicle up to slightly above the target speed ( 20 or $60 \mathrm{mi} / \mathrm{h}$ ) and applying the full braking capacity of the vehicle (full treadle application without the use of a pressure regulator to limit the brake application pressure) until the vehicle came to a complete stop. The procedure followed was that specified for the stopping tests in FMVSS-121, following a straight-line path. This test was performed for all combinations of loading and brake conditions. To provide comparison data, $20-$ and $60-\mathrm{mi} / \mathrm{h}$ stops were also performed using an unbraked control trailer as specified in FMVSS-121 and loaded to bring the tractor up to gross vehicle weight rating (GVWR).

### 2.3.2 Constant-Pressure Stops

Constant-pressure stops were performed by bringing the test vehicle up to slightly above the target speed (20, 40, or $60 \mathrm{mi} / \mathrm{h}$ ) and applying the target constant pressure with an in-line pressure regulator (with driver override capability, for safety) until the vehicle came to a complete stop. Tested pressures were in primarily in the 15- to 45-psi range at intervals of 10 psi. Because the previous five-axle vehicle tests had confirmed that the pressure-deceleration relationship is highly linear in this low- to mid-pressure region, the constant-pressure testing was focused on the variability introduced by weight and brake conditions.

Constant-pressure stopping tests for the RSD brake tests involved the $80,000-\mathrm{lb}, 88,000-\mathrm{lb}$, and 97,000-lb balanced loads for the fully-functioning brake system, disabled tractor drive axle
brakes on one axle, and disabled trailer axle brakes on one axle. Tested brake application pressures of $15,25,35$, and 45 psi ; one of the load/brake conditions was tested at 5 -psi intervals from 15 to 50 psi to show that the limited number of brake application pressures was adequate.

Informed by the results of the RSD testing, the non-RSD constant pressure stops were performed at the same GVWs with the three additional brake conditions: disabled tractor drive axle brakes on three wheel ends, disabled trailer axle brakes on three wheel ends, and disabled steer axle brakes. Brake application pressures tested were reduced to three; 15, 30, and 45 psi.

### 2.3.2 Performance-Based Brake Tests

Performance-based brake tests (PBBT) were performed with a PBBT machine meeting FMCSA functional requirements. In addition to weight and brake force application data, wheel-end air pressure information was also obtained for each axle using pressure transducers.

### 2.3.3 Other Measurements

Weigh tickets were also generated for each load configuration. Additionally, brake-stroke measurements were taken periodically throughout the test period. The temperature of the braking components was also monitored throughout testing to ensure the brakes did not overheat (lining temperatures remaining below $200^{\circ} \mathrm{F}$ ).
[This page intentionally left blank.]

## 3. OVERVIEW OF COLLECTED DATA

### 3.1 DESCRIPTION OF DATA

For the stopping tests, the data signals shown in Table 9 were collected at 100 hertz (Hz). The temperatures listed are for the linings on the indicated wheel-end. For each run, data was collected beginning 1 second (sec) prior to the application of the brakes and ending 0.5 sec after the vehicle speed decreased to $0.4 \mathrm{mi} / \mathrm{h}$.

Table 9. Stopping test streaming data.

| Parameter | Units | Parameter | Units |
| :--- | :---: | :--- | :---: |
| Time | sec | Tractor Axle 1 Right Temperature | F |
| Control Pressure | psi | Tractor Axle 2 Left Temperature | F |
| Tractor Axle 1 Left Pressure | psi | Tractor Axle 2 Right Temperature | F |
| Tractor Axle 1 Right Pressure | psi | Tractor Axle 3 Left Temperature | F |
| Tractor Axle 2 Left Pressure | psi | Tractor Axle 3 Right Temperature | F |
| Tractor Axle 2 Right Pressure | psi | Trailer Axle 1 Left Temperature | F |

| Trailer Axle 2 Left Pressure | psi | Trailer Axle 3 Left Temperature | F |
| Trailer Axle 3 Left Pressure | psi | Trailer Axle 3 Right Temperature | F |
| Trailer Axle 3 Right Pressure | psi | Tractor Axle 1 Left Wheel Speed | $\mathrm{mi} / \mathrm{h}$ |
| Tractor Primary Reservoir Pressure | psi | Tractor Axle 1 Right Wheel Speed | $\mathrm{mi} / \mathrm{h}$ |
| Tractor Secondary Reservoir Pressure | psi | Tractor Axle 2 Left Wheel Speed | $\mathrm{mi} / \mathrm{h}$ |
| Vehicle GPS Speed | $\mathrm{mi} / \mathrm{h}$ | Tractor Axle 2 Right Wheel Speed | $\mathrm{mi} / \mathrm{h}$ |
| Vehicle Deceleration | $\mathrm{ft} / \mathrm{s}^{2}$ | Tractor Axle 3 Left Wheel Speed | $\mathrm{mi} / \mathrm{h}$ |
| Tractor Axle 1 Left Temperature | F | Tractor Axle 3 Right Wheel Speed | $\mathrm{mi} / \mathrm{h}$ |

A sample plot of speed and braking data is shown in Figure 2. This plot shows speed, deceleration, and brake application pressure for one of the constant-pressure stops at the 88,000lb GVW loading condition with the front drive brakes disabled on the RSD test vehicle. For this stop, the original speed was approximately $40 \mathrm{mi} / \mathrm{h}$ before the brakes were applied at 25 psi at time zero seconds.

Figure 2. Chart. Time history plot of data from a constant-pressure stop.
Weigh tickets were obtained for each loading condition to determine the distribution of the load across the vehicle by axle group. A complete list of all test weights along with the nominal weight values used throughout this report is shown in Table 10 and Table 11.

Table 10. Test weights (lb) for RSD brake testing.

| Nominal | Abbreviation | Steer | Drives | Trailer | GVW |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Control Trailer | FMVSS-121 | 13,500 | 39,780 | 4,490 | 57,770 |
| 80,000 | 80 k | 13,120 | 30,110 | 36,800 | 80,030 |
| 88,000 | 88 k | 13,200 | 31,240 | 43,660 | 88,100 |
| 97,000 Balanced | 97 k Bal | 13,410 | 34,270 | 49,390 | 97,070 |
| 97,000 Unbalanced | 97 k Unbal | 13,260 | 42,590 | 41,180 | 97,030 |
| 112,000 | 112 k | 13,110 | 39,360 | 59,680 | 112,150 |
| 132,000 | 132 k | 13,500 | 47,120 | 71,420 | 132,040 |

Table 11. Test weights (lb) for non-RSD brake testing.

| Nominal | Abbreviation | Steer | Drives | Trailer | GVW |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Control Trailer | FMVSS-121 | 13,120 | 40,150 | 4,500 | 57,770 |
| 80,000 | 80 k | 13,100 | 30,150 | 36,800 | 80,050 |
| 88,000 | 88 k | 13,150 | 31,250 | 43,890 | 88,290 |
| 97,000 Balanced | 97 k Bal | 13,340 | 34,260 | 49,630 | 97,230 |
| 97,000 Unbalanced | 97 k Unbal | 13,150 | 42,590 | 41,370 | 97,110 |
| 112,000 | 112 k | 13,020 | 39,410 | 59,810 | 112,240 |
| 132,000 | 132 k | 13,430 | 46,980 | 71,480 | 131,890 |

A number of signals were collected during the PBBT tests as well. The information listed in Table 12 was collected at 10 Hz for each axle during testing of the service brakes.

Table 12. PBBT service brake streaming data.

| Parameter | Units |
| :--- | :---: |
| Time | sec |
| Brake Force Left | lb |
| Lock-up Left | lb |
| Brake Force Right | lb |
| Lock-up Right | lb |
| Weight Left | lb |
| Weight Right | lb |
| Control Pressure | psi |
| Chamber Pressure | psi |

### 3.2 CALCULATION OF KEY PARAMETERS FOR EACH STOP

Link Engineering, the company that was contracted to perform the tests and collect the data referenced in Section 3.1, provided several key parameters for each stopping test. These parameters are listed in Table 13. The values for each of these parameters for every stopping test performed appear in Appendix A.

Stopping distance was determined from a global positioning system (GPS) with an internal accelerometer that is used to correct the data points between actual measurements from GPS position. The output from this accelerometer was used by the data-acquisition system to record the actual distance from the beginning of the braking event (triggered by using a pedal switch on the brake pedal) and the end of the braking event (triggered when the vehicle speed decreased to $0.4 \mathrm{mi} / \mathrm{h})$. The stop time was determined by the time between these two triggers. Like the stopping-distance measurement, the deceleration was also measured with an accelerometer with the data being filtered to reduce the noise. Average pressures and decelerations were calculated from the data beginning 1.0 seconds after the braking event is initiated until the end of the stop.

Table 13. Parameters calculated for each stopping test.

| Measure | Units |
| :--- | :---: |
| Stop \# | -- |
| Target Speed | $\mathrm{mi} / \mathrm{h}$ |
| Target Control Pressure | psi |
| Actual Speed | $\mathrm{mi} / \mathrm{h}$ |
| Actual Stopping Distance | ft |
| Corrected Stopping Distance | ft |
| Average Primary Control Pressure | psi |
| Average Deceleration | $\mathrm{ft} / \mathrm{s}^{2}$ |
| Stopping Time (seconds) | sec |

### 3.3 ADDITIONAL DATA COMMENTS

As indicated in Section 2.3.4, the brake stroke length was also monitored throughout the testing to ensure the automatic slack adjusters were functioning properly. While this data was not used in the analysis presented in this report, it is included in Appendix B for reference.

## 4. ANALYSIS OF SERVICE BRAKE STOP DATA

Service brake stops provide insight into the maximum brake force that can be developed, typical of an emergency situation where a driver would need to apply full brake force without regard to smooth deceleration. Decelerations determined from this test data represents the maximum possible under the tested scenario (brake condition, initial speed, and road condition), and the stopping distances similarly represent the shortest distances possible. Note that driver response time is not a factor in these tests; the deceleration and stopping distance data is calculated from the time of initial brake application and thus represents an effective a driver response time of zero seconds.

### 4.1 TRACTOR TESTING WITH A CONTROL TRAILER

The first set of stopping tests conducted were FMVSS 121 protocol service brake stops from 20 and $60 \mathrm{mi} / \mathrm{h}$ with an unbraked control trailer attached to the tractor with a GVW of approximately $56,000 \mathrm{lb}$. While these tests did not represent typical in-service loading events, they provided confirmation that the tractor met the required minimum brake performance standard for new equipment. FMVSS 121 specifies that for "loaded tractors with three axles and a GVWR of 70,000 lb or less...tested with an unbraked control trailer," the $20 \mathrm{mi} / \mathrm{h}$ stopping distance for RSD brakes must be no more than 30 ft and the $60 \mathrm{mi} / \mathrm{h}$ stopping distance must be no more than $250 \mathrm{ft} .{ }^{(1)}$ FMVSS 121 protocol stopping tests were performed at both 20 and 60 $\mathrm{mi} / \mathrm{h}$ and were repeated for disabled brakes on a drive axle as well. The FMVSS 121 stopping distance requirements are shown along with the average tested stopping distances in Table 14 (values corrected for slight deviations in initial speed as specified by FMVSS 121 protocol). As shown here, the test vehicle exceeded the minimum performance standards equipped with either the RSD or non-RSD brakes.

Table 14. FMVSS 121 stopping distance test results.

| Stopping Distance Description | Stopping Distance (ft) FMVSS <br> 121 Requirement (Maximum) | Stopping Distance (ft) Average <br> for Test Vehicle (Corrected) |
| :--- | :---: | :---: |
| RSD: $20 \mathrm{mi} / \mathrm{h}$ | 30 | 27.5 |
| Non-RSD: $20 \mathrm{mi} / \mathrm{h}$ | 40 | 30.2 |
| RSD: $60 \mathrm{mi} / \mathrm{h}$ | 250 | 228.2 |
| Non-RSD: $60 \mathrm{mi} / \mathrm{h}$ | 355 | 257.8 |

### 4.2 OVERVIEW OF RESULTS FOR 20 MI/H SERVICE BRAKE STOPS

The average stopping distances for the $20 \mathrm{mi} / \mathrm{h}$ service brake stops for RSD and non-RSD tests are shown in Figure 3 and Figure 4, respectively. Table 15 and Table 16 present this same information in tabular form. The average values are presented here to show general trends in the data; the actual stopping distances for each run appear in Appendix A. The distances for the regular service brake stops for all loads and brake conditions tested were under the 40 -ft limit specified in FMCSR 393.52(3), with the exception of the non-RSD disabled drive axle braking performance for the unbalanced 97,000 and 132,000 testing.

Figure 3. Chart. Comparison of stopping distances for $20 \mathrm{mi} / \mathrm{h}$ service brake stops (RSD brakes).

Figure 4. Chart. Comparison of stopping distances for $20 \mathrm{mi} / \mathrm{h}$ service brake stops (non-RSD brakes).

Table 15. Average corrected stopping distance for $20 \mathrm{mi} / \mathrm{h}$ service brake stops (RSD brakes).

| Loading Condition | Stopping Distance (ft) <br> Fully Functioning | Stopping Distance (ft) <br> Disabled 1 Drive Axle | Stopping Distance (ft) <br> Disabled 1 Trailer Axle |
| :--- | :---: | :---: | :---: |
| FMVSS 121 control trailer | 27.5 | -- | -- |
| 80,000 lb load | 30.0 | 37.5 | 35.8 |
| 88,000 lb load | 31.2 | 37.7 | 36.6 |
| 97,000 lb balanced load | 29.8 | 37.4 | 34.1 |
| 97,000 lb unbalanced load | 29.8 | 39.3 | 34.0 |
| 112,000 lb load | 29.7 | 36.6 | 35.8 |
| 132,000 lb load | 31.0 | 38.2 | 35.6 |

Table 16. Average corrected stopping distance for $20 \mathrm{mi} / \mathrm{h}$ service brake stops (non-RSD brakes).

| Loading Condition | Stopping Distance (ft) <br> Fully Functioning | Stopping Distance (ft) <br> Disabled 1 Drive Axle | Stopping Distance (ft) <br> Disabled 1 Trailer Axle |
| :--- | :---: | :---: | :---: |
| FMVSS 121 control trailer | 30.2 | -- | -- |
| $80,000 \mathrm{lb}$ load | 31.2 | 38.8 | 36.4 |
| $88,000 \mathrm{lb}$ load | 31.8 | 37.9 | 38.0 |
| $97,000 \mathrm{lb}$ balanced load | 31.8 | 38.5 | 37.5 |
| $97,000 \mathrm{lb}$ unbalanced load | 33.2 | 41.6 | 38.0 |
| $112,000 \mathrm{lb}$ load | 32.4 | 38.2 | 36.7 |
| $132,000 \mathrm{lb}$ load | 35.9 | 41.9 | 39.0 |

### 4.3 OVERVIEW OF RESULTS FOR $60 \mathrm{MI} / \mathrm{H}$ SERVICE BRAKE STOPS

The average stopping distances for the $60 \mathrm{mi} / \mathrm{h}$ service brake stops are shown in Figure 5 (actual values in Table 17) and Figure 6 (values in Table 18). These tests were performed for all six braking conditions.

Figure 5. Chart. Comparison of stopping distances for $\mathbf{6 0} \mathbf{m i} / \mathrm{h}$ service brake stops (RSD).
Table 17. Average corrected stopping distances for $60 \mathrm{mi} / \mathrm{h}$ service brake stops (RSD).

|  | Stopping <br> Distance (ft) <br> Fully | Stopping <br> Distance (ft) <br> Lisabled 1 <br> Functioning | Stopping <br> Distance (ft) <br> Disabled 1 <br> Trailer Axle | Stopping <br> Distance (ft) <br> Disabled 3 <br> Drive Wheel <br> Ends | Stopping <br> Distance (ft) <br> Disabled 3 <br> Trailer <br> Wheel Ends | Stopping <br> Distance (ft) <br> Disabled <br> Steer Axle |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| FMVSS-121 control trailer | 228.1 | -- | -- | -- | -- | -- |
| 80,000 lb load | 217.8 | 288.6 | 272.1 | 297.2 | 279.6 | 281.1 |
| 88,000 lb load | 215.7 | 273.2 | 289.6 | 312.9 | 291.4 | 282.4 |
| $97,000 \mathrm{lb}$ balanced load | 220.7 | 291.8 | 273.7 | 334.9 | 288.4 | 290.5 |
| $97,000 \mathrm{lb}$ unbalanced load | 215.0 | 292.0 | 274.4 | 339.4 | 273.2 | 263.2 |
| $112,000 \mathrm{lb}$ load | 233.9 | 310.8 | 283.0 | 366.0 | 308.5 | 296.4 |
| $132,000 \mathrm{lb}$ load | 268.8 | 362.9 | 334.3 | 443.8 | 385.3 | 357.2 |

Table 18. Average corrected stopping distances for $60 \mathrm{mi} / \mathrm{h}$ service brake stops (non-RSD brakes).
$\left.\begin{array}{|l|c|c|c|c|c|c|}\hline & \begin{array}{c}\text { Stopping } \\ \text { Distance (ft) } \\ \text { Fully }\end{array} & \begin{array}{c}\text { Stopping } \\ \text { Listance (ft) } \\ \text { Lisabled 1 } \\ \text { Functioning }\end{array} & \begin{array}{c}\text { Stopping } \\ \text { Distance (ft) } \\ \text { Disabled Axle }\end{array} & \begin{array}{c}\text { Stopping } \\ \text { Trailer Axle }\end{array} & \begin{array}{c}\text { Stopping } \\ \text { Distance (ft) } \\ \text { Disabled 3 } \\ \text { Drive } \\ \text { Wheel Ends }\end{array} & \begin{array}{c}\text { Distance (ft) } \\ \text { Disabled 3 } \\ \text { Trailer } \\ \text { Wheel Ends }\end{array}\end{array} \begin{array}{c}\text { Stopping } \\ \text { Distance (ft) } \\ \text { Disabled } \\ \text { Steer Axle }\end{array}\right]$

As described previously, the control trailer testing was performed with an unbraked control trailer; thus, the service brake stops performed with the control trailer represent a stop in which the total braking force is provided by the steer and drive axles only.

### 4.4 ANTI-LOCK BRAKING SYSTEM AND SERVICE BRAKE STOP DATA

Several additional test runs were performed to examine the effect of the ABS on stopping distance when the test vehicle equipped with non-RSD brakes was loaded to a GVW of $97,000 \mathrm{lb}$ (balanced load). Three runs each were performed for the tractor ABS disabled and the entire ABS disabled for panic stops from 20 and $60 \mathrm{mi} / \mathrm{h}$. The results are compared to those of the regular ABS-enabled stopping tests in Figure 7 and Figure 8.

Figure 7. Chart. Effect of disabling ABS on $20 \mathrm{mi} / \mathrm{h}$ stopping distance.

Figure 8. Chart. Effect of disabling ABS on $60 \mathrm{mi} / \mathrm{h}$ stopping distance.
While the variation in the data set makes it difficult to draw any clear conclusions, in the tested scenario, disabling the ABS resulted in generally shorter stopping distances. However, it is of note that all testing in this phase was on dry pavement and is not expected to be representative of degraded road conditions.

### 4.5 OBSERVED TRENDS IN SERVICE BRAKE STOP DATA

The test data for both $20 \mathrm{mi} / \mathrm{h}$ and $60 \mathrm{mi} / \mathrm{h}$ stopping tests revealed a difference in brake force supplied depending on which brakes were disabled. For the test scenarios where the brakes on a single axle were disabled, disabling a pair of drive axle brakes resulted in a greater stopping distance (decreased braking force) than disabling a pair of trailer brakes. The relationship held true for both initial speeds and all loading conditions. Thus, for the vehicle tested, more brake force was generated by the drive axle brakes than the trailer axle brakes.

As expected, increases in load resulted in corresponding increase in stopping distance, with a few minor exceptions for unknown reasons in the $20 \mathrm{mi} / \mathrm{h}$ stopping data.

### 4.6 ANALYSIS OF TIRE LOAD CAPACITY

Another area of concern to policy-makers considering loading regulations includes tire capacity. Tire capacities for each axle group are summarized and compared to the test loads in Table 19 and Table 20.

Table 19. Tire load capacity for RSD loading conditions.

| Load Condition <br> (RSD Brake Testing) | GVW (lb) | Steer Axle (lb) <br> Capacity | Drive Axle Group <br> (lb) Capacity | Trailer Axle Group <br> (lb) Capacity |
| :--- | :---: | :---: | :---: | :---: |
| Tire Capacity | -- | $\mathbf{1 3 , 5 6 0}$ | $\mathbf{4 5 , 4 0 0}$ | $\mathbf{7 1 , 2 8 0}$ |
| Control trailer (FMVSS 121, | 53,280 | 13,500 | 39,780 | -- |
| only tractor weight shown) |  | $99.6 \%$ | $87.6 \%$ |  |
| 80,000 lb load | 80,030 | 13,120 | 30,110 | 36,800 |
|  |  | $96.8 \%$ | $66.3 \%$ | $51.6 \%$ |
| 88,000 lb load | 88,100 | 13,200 | 31,240 | 43,660 |
|  |  | $97.3 \%$ | $68.8 \%$ | $61.3 \%$ |
| 97,000 lb balanced load | 97,070 | 13,410 | 34,270 | 49,390 |
|  |  | $98.9 \%$ | $75.5 \%$ | $69.3 \%$ |
| 97,000 lb unbalanced load | 97,030 | 13,260 | 42,590 | 41,180 |
|  |  | $97.8 \%$ | $93.8 \%$ | $57.8 \%$ |
| 112,000 lb load | 13,110 | 39,360 | 59,680 |  |
|  | 112,150 | $96.7 \%$ | $86.7 \%$ | $83.7 \%$ |
| 132,000 lb load | 13,500 | 47,120 | 71,420 |  |
|  | $99.6 \%$ | $103.8 \% *$ | $100.2 \% *$ |  |

*For the $132,000-\mathrm{lb}$ configuration, an overload condition was created for the rating of the tires used for testing.

Table 20. Tire load capacity for non-RSD loading conditions.

| Load Condition <br> (Non-RSD Brake Testing) | GVW (lb) | Steer Axle (lb) <br> Capacity | Drive Axle Group <br> (lb) Capacity | Trailer Axle <br> Group (lb) <br> Capacity |
| :--- | :---: | :---: | :---: | :---: |
| Tire capacity | -- | 13,560 | 45,400 | 71,280 |
| Control trailer (FMVSS 121, | 53,270 | 13,120 | 40,150 | -- |
| only tractor weight shown) |  | $96.8 \%$ | $88.4 \%$ |  |
| 80,000 lb load | 80,050 | 13,100 | 30,150 | $66.4 \%$ |

*For the $132,000-\mathrm{lb}$ configuration, an overload condition was created for the rating of the tires used for testing.
As a product of the desired 132,000-lb test configuration, a slightly overloaded condition was created for the rating of the tires used for testing. Adjustments could have been made to tire pressure and tire selection to avoid this condition. In the trailer tires, this could have been addressed with a change to the tire pressure; a pressure of 110 psi instead of the tested 105 psi would increase the maximum trailer axle group load from 71,280 lb to $74,100 \mathrm{lb}$. Since the drive axle tires were already at maximum rated pressure for the tire model, a higher load range tire would have been need to test at this GVW unless the load were redistributed between the drive and trailer axle groups. For example, the use of load range "H" tires instead of load range "G" would have increased the rated load from 45,400 to $49,400 \mathrm{lb}$. Similar research involving testing at high GVWs without exceeding rated tire loads may be possible with similar adjustments to tire configurations.

## 5. ANALYSIS OF PERFORMANCE-BASED BRAKE TESTER DATA

### 5.1 OVERVIEW OF RESULTS

The PBBT tests were performed for each loading and brake condition for the RSD testing, and for each loading condition for the non-RSD testing. Results of individual PBBT tests are included in Appendix C. The PBBT overall vehicle scores for the fully functioning brakes are shown in Table 21.

Table 21. PBBT scores for fully-functioning brake systems.

| Load Condition | RSD <br> Braking <br> Force (lb) | RSD <br> GVW <br> (lb) | RSD <br> Brake <br> Efficiency | Non-RSD <br> Braking <br> Force (lb) | Non-RSD <br> GVW <br> (lb) | Non-RSD <br> Brake <br> Efficiency |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| 80,000 lb load | 40,479 | 79,190 | $51.1 \%$ | 40,525 | 77,514 | $52.3 \%$ |
| 88,000 lb load | 46,428 | 87,523 | $53.0 \%$ | 43,761 | 85,010 | $51.5 \%$ |
| 97,000 lb balanced load | 49,044 | 95,768 | $51.2 \%$ | 50,226 | 95,329 | $52.7 \%$ |
| 97,000 lb unbalanced load | 43,687 | 97,622 | $44.8 \%$ | 47,297 | 93,388 | $50.6 \%$ |
| 112,000 lb load | 55,618 | 112,083 | $49.6 \%$ | 53,969 | 108,556 | $49.7 \%$ |
| 132,000 lb load | 64,348 | 131,351 | $49.0 \%$ | 62,299 | 129,807 | $48.0 \%$ |

### 5.2 DATA OBSERVATIONS

This information is shown in bar chart form in the following figures. Figure 9 shows the overall PBBT scores for the fully functioning brake systems-both RSD and non-RSD. Interestingly, the RSD brakes did not consistently out-perform the non-RSD brakes for these tests. There is a general decrease in score (total braking force divided by total vehicle weight) as the load increases, as expected.

Figure 9. Chart. Brake efficiency of test vehicles.
Figure 10 shows the total measured braking force for each loading condition. The total braking force developed by the test vehicle during the PBBT test increased overall as the load increased, with the exception of the unbalanced loading condition. This suggests that brakes are more efficient at higher loads, and an unbalanced load can have a detrimental effect on braking performance.

Figure 10. Chart. Total braking force for each loading condition as measured by the PBBT.

### 5.3 COMPARISON OF SCALE AND PBBT-REPORTED WEIGHTS

Brake efficiency is calculated by dividing the sum of the wheel-end brake forces by the sum of the wheel-end weights. The GVW measured and used by the PBBT machine is compared to the GVW reported in the weight ticked from the scale in Table 22 and graphed in Figure 11.

Table 22. Comparison of scale and PBBT-reported GVW.

| Load Condition (lb) | PBBT GVW <br> (lb) | Scale GVW <br> (lb) | Braking Force <br> (lb) | GVW <br> (lb) |
| :--- | :---: | :---: | :---: | :---: |
| 80,000 lb load | 79,190 | 80,030 | 77,514 | 80,050 |
| 88,000 lb load | 87,523 | 88,100 | 85,010 | 88,290 |
| 97,000 lb balanced load | 95,768 | 97,070 | 95,329 | 97,230 |
| 97,000 lb unbalanced load | 97,622 | 97,030 | 93,388 | 97,110 |
| 112,000 lb load | 112,083 | 112,150 | 108,556 | 112,240 |
| 132,000 lb load | 131,351 | 132,040 | 129,807 | 131,890 |

Figure 11. Chart. Comparison of PBBT and scale-reported GVW.
As shown in this figure, the PBBT occasionally measured a total weight value slightly under GVW measured on the scale. This is likely because unlike the pit scale, the axles are weighed individually and the weighing surface is not level with respect to the length of the vehicle. The
under-reporting of the non-RSD weights may be responsible for lack of a clear trend comparing the RSD to non-RSD brakes.

## 6. DEVELOPMENT OF CONSTANT-PRESSURE DECELERATION MODEL

### 6.1 BACKGROUND

In addition to the service brake stops (full-pressure stops) conducted for stopping distance research, constant-pressure stops were performed to support the development of a real-time dynamic brake assessment (RTDBA) algorithm. Such an algorithm would be incorporated to an on-board system to provide warnings for potentially under real-world brake performance

Where the previous five-axle testing involved three braking conditions (fully functioning, disabled drive axle, disabled trailer axle), there were only two initial speeds tested (20 and 60 $\mathrm{mi} / \mathrm{h}$ ) and only two GVWs ( $60,000 \mathrm{lb}, 80,000 \mathrm{lb}$ ). Due to the limited breadth of data collected in the five-axle testing, a clear relationship between deceleration and GVW or deceleration and initial speed could not be determined. In this most recent six-axle testing, in addition to the similar three braking conditions (fully function, disabled forward drive, and disabled intermediate trailer), the constant-pressure tests involved three GVWs (80,000, 88,000, and $97,000 \mathrm{lb}$ ) and three initial speeds ( 20,40 , and $60 \mathrm{mi} / \mathrm{h}$ ). As such, the data can be used to determine how brake application pressure, initial speed, and GVW influence deceleration for each brake condition.

### 6.2 LINEAR PRESSURE REGION

In order to confirm that the pressure-deceleration relationship was in fact linear in the 15-45 psi region and to explore whether the linear region extended beyond the 45-psi limit, there was more resolution in the brake application pressure data for the first loading and brake condition (80,000 lb GVW, fully functioning brakes). The data from the first loading condition is shown in Figure 12.

Figure 12. Chart. Pressure-deceleration curves for RSD brakes tested at 80,000-lb load.
At the higher 50 psi brake pressure, the relationship between pressure and deceleration is no longer linear. However, this relationship is highly in the 15-45 psi range, as anticipated (and observed in previous research). The RTDBA algorithm should be based on pressures in linear region-here (as in previous research) using 15 psi (comfortably above the crack pressure) to 45 psi (less than the pressure at which nonlinearities appear).

### 6.3 EFFECT OF GROSS VEHICLE WEIGHT

The breadth of six-axle data collected allowed the link between GVW and deceleration to be examined. Previously, only two weights were tested, so the relationship between deceleration and GVW could not be characterized (although it was observed that the braking system was more effective for lower than higher GVWs). Constant-pressure test data for a single initial
speed and brake condition were selected for cursory observation to determine whether it would be reasonable to model the relationship between deceleration and GVW as a linear one as shown in Figure 13.

Figure 13. Chart. Deceleration vs. GVW for $40-\mathrm{mi} / \mathrm{h}$ RSD testing with fully-functioning brakes.
From this initial look at the data, it appears that deceleration is a linear function of the GVW.

### 6.4 EFFECT OF INITIAL SPEED

The breadth of six-axle data collected also allowed the link between initial speed and deceleration to be examined. Previously, only two weights were tested, so the relationship between deceleration and initial speed could not be characterized (although it was observed that the braking system was more effective-developing a greater overall deceleration-from an initial speed of $20 \mathrm{mi} / \mathrm{h}$ than $60 \mathrm{mi} / \mathrm{h}$ ). Constant-pressure test data for a single GVW and brake condition were selected for cursory observation to determine whether it would be reasonable to model the relationship between deceleration and GVW as a linear one also shown in Figure 14.

Figure 14. Chart. Deceleration versus initial speed for RSD testing with fully-functioning brakes at $\mathbf{8 8 , 0 0 0} \mathbf{l b}$.
From this cursory analysis, it seems reasonable to assume that the deceleration is a linear function of the initial speed at which the brakes are applied.

### 6.5 LINEAR MODEL FROM MULTIPLE REGRESSION ANALYSIS

With the conclusion that deceleration is linear with respect to GVW, initial speed, and brake application pressure (in the 15-45 psi region), multiple regression analysis was performed to determine quantitatively the "level" of this linearity in the direction of each variable and construct a linear model for deceleration using the variables which proved to be significant.

In other words, an analysis was performed in Excel (and later repeated in Matlab) for the following model:

$$
y_{g}=m_{p s i} \cdot x_{p s i}+m_{m p h} \cdot x_{m p h}+m_{l b} \cdot x_{l b}+b
$$

Figure 15. Equation. Linear model from multiple regression analysis.
Note that any units could be used for deceleration, pressure, speed, and GVW, provided that the constants are calculated accordingly.

All collected constant-pressure data for the fully functioning brake situation was used in the development and the linear model. (Pressures above 50 psi were omitted, as discussed previously, but the data set included the three initial speeds and three GVWs tested.)

The values shown in Table 23 were calculated from this data.

Table 23. Multiple regression values for six-axle RSD constant-pressure stop data (fully functioning brakes).

| Variable | Value |
| :--- | :--- |
| Coefficients | $\mathrm{m}_{\mathrm{psi}}=1.121 \mathrm{E}-02$ <br> $\mathrm{~m}_{\mathrm{mi/h}}=-9.102 \mathrm{E}-04$ <br> $\mathrm{~m}_{\mathrm{lb}}=-2.976 \mathrm{E}-06$ <br> $\mathrm{~b}=2.457 \mathrm{E}-01$ |
| Standard error | $\mathrm{se}_{\mathrm{psi}}=2.068 \mathrm{E}-04$ <br> $\mathrm{se}_{\mathrm{mi} / \mathrm{h}}=1.349 \mathrm{E}-04$ <br> $\mathrm{se}_{\mathrm{lb}}=3.105 \mathrm{E}-07$ <br> $\mathrm{se}_{\mathrm{b}}=2.824 \mathrm{E}-02$ |
| Coefficient of determination | $\mathrm{r}^{2}=0.9867807$ |
| Standard error of the y estimate | $\mathrm{se}_{\mathrm{y}}=0.0147244$ |
| F-statistic | $\mathrm{F}=1020.1758$ |
| Degrees of freedom | $\mathrm{d}_{\mathrm{f}}=41$ |
| Regression sum of squares | $\mathrm{ss}_{\mathrm{reg}}=0.6635462$ |
| Residual sum of squares | $\mathrm{ss}_{\mathrm{resid}}=0.0088891$ |
| Sample size | $\mathrm{n}_{\mathrm{e}}=45$ |
| T-observed (abs) | $\mathrm{t}_{\mathrm{psi}}=54.214$ <br> $\mathrm{t}_{\mathrm{mi/h}}=6.745$ |
| $\mathrm{t}_{\mathrm{lb}}=9.582$ <br> $\mathrm{t}_{\mathrm{b}}=8.701$ |  |
| Min abs. value of T for statistical <br> significance | $\mathrm{alpha}=0.01$ <br> $\mathrm{~T}-\mathrm{critical}=2.7012$ |
| Probably F-value occurred by <br> chance | $\mathrm{v} 1=3$ <br> $\mathrm{p}=1.578 \mathrm{E}-38$ |

The coefficient of determination indicates the proportion of the variability-in this case, nearly 99 percent. The alpha (and calculated T-critical) was chosen for a 99 percent statistical significance for the four constants used in this model. In this case, the T-observed values for each variable are well above this value.

### 6.6 LINEAR MODEL APPLIED TO OTHER CONSTANT-PRESSURE DATA SETS

Multiple regression was performed for the other two brake conditions tested in the six-axle RSD constant-pressure stops. In addition, the linear model was also applied to the five-axle RSD test data (all three brake conditions). The results are summarized in Table 24.

Table 24. Linear model values for five-axle and six-axle RSD brake testing.

| Description | Six-Axle Vehicle RSD Brakes Fully Functioning | Six-Axle Vehicle RSD Brakes Disabled Drive | Six-Axle Vehicle RSD Brakes Disabled Trailer Axle | Five-Axle Vehicle RSD Brakes Fully Functioning | Five-Axle Vehicle RSD Brakes Disabled Drive | Five-Axle Vehicle RSD Brakes Disabled Trailer Axle |

In reality, these models exist in four-dimensional space (three input variables and one output variable). For illustration purposes, the weight was held constant, leaving only two input variables and allowing each model to be visualized as a plane in three-dimensional space, as shown in Figure 16.

Figure 16. Chart. Linear deceleration model for $\mathbf{6}$-axle RSD test vehicle at $\mathbf{9 0 , 0 0 0} \mathbf{- l b}$ GVW.
Sample plots for the 88,000-lb GVW 6-axle non-RSD testing are shown in Figure 17 and Figure 18 (two different views of the same plot).

Figure 17. Chart. Linear deceleration model for $\mathbf{6}$-axle non-RSD test vehicle at $\mathbf{8 8 , 0 0 0} \mathbf{- l b}$ GVW (view $\mathbf{1}$ ).

Figure 18. Chart. Linear deceleration model for 6 -axle non-RSD test vehicle at 88,000-lb GVW (view 2).

### 6.7 APPLICATION OF LINEAR MODEL

The analysis presented here is based on the assumption that the data comes from constantpressure application of brakes within this linear pressure region. It is therefore expected to be a suitable model for typical day-to-day brake application events, but unsuited for the prediction of service brake stops performance ( $\sim 90+\mathrm{psi}$ ), PBBT tests ( $\sim 60 \mathrm{psi}$ ), or brake applications where insufficient pressure is applied to activate all vehicle brakes (i.e., below crack pressure, typically $<10 \mathrm{psi})$.

### 6.8 POSSIBLE RTDBA APPLICATIONS OF MODEL

### 6.8.1 Detection of Degradation of Brake Performance

One way in which the model could be implemented is an algorithm that tracks performance over time and detects change for the worse throughout the life of the brake components. In this application, there would be a constant monitoring or building of the model for a given tractor/trailer combination and the algorithm would detect substantial degradation in performance. (The precise definition of "substantial degradation" is yet to be determined.)

This application would require that data points to feed the linear model be generated frequently since the multiple regression models must be constructed for each tractor/trailer combination. This would be difficult to implement for drop-and-hook operators, where a given system (tractor and trailer) may only be seen once every few months (depending on the number of tractors and trailers in a company's pool), and data may only be collected for a single loading condition at a time for long-haul operations. Another disadvantage of this application even for mated tractortrailers is that it is more subjective as it assumes a particular starting point as representative of good brake performance and degradation from that point would present a potential safety issue, whereas safety issues may already be present in the "baseline" condition.

### 6.8.2 Determination of "Safe" and "Unsafe" Performance Regions

A second RTDBA application of the multiple regression model is the determination of a "safe space" for brake performance. This would be similar to splitting the four-dimensional space (in the region where the input variables of initial speed, GVW, and brake application pressure have a linear relationship to the output variable of deceleration) into "safe" and "unsafe" regions (this would be akin to having another plane in Figure 16 between the fully functioning and brake defect models to serve as a "dividing line"). This concept is illustrated in a simplified twodimensional graph in Figure 19, where the weight and speed are set as constants ( $88,000 \mathrm{lb}$ and $40 \mathrm{mi} / \mathrm{h}$, respectively).

Figure 19. Graph. Potential "safe region" application of linear deceleration model.

Real-world brake performance data above the "dividing line" would be considered acceptable (green region), and data falling below it would be considered unacceptable, indicating a brake defect (red region).

The implementation of this type of algorithm would requires knowledge of not just the ideal allbrakes working capacity, but an understanding of how much variation is reasonable within "good" or "acceptable" brakes, to avoid mistakenly identifying brakes as defective or unsafe brakes as acceptable. A standard for this "dividing line" must be explored and developed. Existing standards (minimum PBBT score and maximum service brake stopping distance) are applicable to higher brake application pressures than those experienced on day-to-day basis, and thus not suitable standards for brake performance monitoring using real-world driving cycles (where higher pressures are not typically seen).

## 7. LESSONS LEARNED

As with any research and testing effort, certain lessons were learned this may provide guidance for future research of a similar nature.

### 7.1 PROCUREMENT AND SCHEDULING PROCESSES

Testing of this nature requires the test facility roadway to be clear. Further, it is best facilitated in the warmer months of the year to eliminate the chance of snow and or ice delaying testing. Depending on the location of the test facility, seasons and pending long bad weather periods must be calculated in the overall test duration and budgeting. Clear communication and delineation of scheduling expectations should be conveyed to the testing facility and periodic follow-up conversations are recommended to abate possible schedule creep that could delay testing into inclement weather.

To ensure overall test schedule compliance, a day-to-day test schedule is recommended that sets testing milestones that should be accomplished throughout the testing period. This day-to-day schedule should have a reasonable amount of contingency to allow for sporadic weather issues and equipment malfunctions. The day-to-day schedule should be agreed to by the testing sponsor and the testing facility and, once accepted, be used to measure progress and alert the research team to schedule creep that can be detrimental to time-sensitive testing.

### 7.2 REDUCED DATASET FOR RTDBA SUPPORT

The first set of six-axle tests (with the RSD brakes) showed the deceleration model for lowpressure stops to be highly linear and the stopping data highly repeatable. Based on this observation, the test plan for the non-RSD brakes was designed with only three brake application pressures (rather than four) and a single run for each speed/pressure combination (rather than three). This allowed a much broader set of data to be collected; three additional brake conditions were tested for a similar number of overall test runs.
[This page intentionally left blank.]

## 8. FUTURE DIRECTIONS

This research built upon previous five-axle tractor-semitrailer brake performance research to determine the effect of loading and brake condition on service brake stopping distances for both RSD and non-RSD brakes in a variety of loaded vehicle conditions. Areas of further research could include testing tractor semitrailer brake performance with additional brake performance degradation introduced by the use of selectively adjusted manual slack adjusters. Additional brake performance testing of straight trucks and buses under various loading conditions would provide additional useful data, and test data for double and triple trailer configurations may also be of value.

Further examination of an on-board brake assessment algorithm also revealed gaps in understanding which would be of benefit in development of such an algorithm. In addition to the testing of additional vehicles to determine differences between vehicle types, a key next step would also involve real-world data collection, where the values used in the linear deceleration model would be collected from an in-service vehicle and compared to test track results. The final goal of such an on-board brake assessment algorithm would be the ability to determine vehicle brake performance through readily available on-board vehicle performance data (from the vehicle data bus) coupled with brake deceleration data obtained thru normal vehicle braking operations.

## APPENDIX B: BRAKE STROKE MEASUREMENT LOG

As indicated in Section 2.3.4, the brake stroke length was also monitored throughout the testing to ensure the automatic slack adjusters were functioning properly. While this data was not used in the analysis presented in this report, it is included here in Appendix B.

## APPENDIX C: PBBT RESULTS

The PBBT tests were performed for each loading and brake condition for the RSD testing, and for each loading condition for the non-RSD testing. Results of individual PBBT tests are included here in Appendix C.

Table 26. RSD PBBT results-fully functioning brakes.
