## FREQUENTLY USED TABLES

New Personal Vehicle Fuel Economy for Selected Countries ..... 1-9
Transportation Energy Use by Mode and Fuel Type ..... 2-11
Passenger Travel and Energy Use ..... 2-15
Energy Intensities of Passenger Modes ..... 2-17
Energy Intensities of Freight Modes ..... 2-18
Vehicle Miles of Travel by Vehicle Type ..... 3-3
Autos and Trucks in Use ..... 3-6
Annual Automobile Miles by Age ..... 3-13
Truck Size Class Definitions and Fuel Economy ..... 3-28
CAFE Standards ..... 3-43
Gas Guzzler Tax Schedule ..... 3-45
Fuel Economy as a Function of Speed ..... 3-47
Transportation's Contribution to Emissions ..... 7-2
Vehicle Emission Standards ..... 7-11
Heating Values of Fuels ..... B-2
Energy Unit Conversions ..... B-4
GNP Implicit Price Deflator ..... B-14

## COMMON CONVERSIONS

| 1 Quad | $\begin{aligned} & =84,997.9 \text { Gigawatthours }^{\mathrm{a}} \\ & =0.4724 \text { million barrels per day of oil (mbpd), or } \\ & =- \end{aligned}$ |
| :---: | :---: |
| 1 Gigawatthour | $=1.1765 \times 10^{-5}$ Quads $^{\text {a }}$ |
| 1 Mbpd | $=2.117$ Quads per year |
| 1 Barrel | 42 gallons |
| 1 Btu | 1055 Joules |
| 1 Gallon of Gasoline | $=125,000 \mathrm{Btu}$ (gross) $=115,400 \mathrm{Btu}$ (net) |
| 1 Gallon of Ethanol | $=84,600 \mathrm{Btu}$ (gross) $\quad=75,670 \mathrm{Btu}$ (net) |
| 1 Gallon of Methanol | $64,600 \mathrm{Btu}$ (gross) $=56,560 \mathrm{Btu}$ (net) |
| 1 Gallon of Diesel | $=138,700 \mathrm{Btu}$ (gross) $=128,700 \mathrm{Btu}$ (net) |
| 1 Gallon of Gasoline | $=6.2$ pounds |
| 1 U.S. Gallon | $=0.8321$ Imperial Gallons $=3.785$ Liters |
| 1 Liter | 61.026 Cubic inches |
| Inertia Weight | $=$ Curb Weight +300 Pounds |
| 1 Mph | $=1.609 \mathrm{Kph}$ |
| 1 Horsepower | $=0.7457$ Kilowatts |
| 1 Mile | 1.609 Kilometers |

${ }^{a}$ Electricity generation and distribution have been taken into account. Without electricity generation and distribution, 1 Gigawatthour $=0.3412 \times 10^{-5}$ Quads and 1 Quad = 293,083.2 Gigawathours.

## FOREWORD

This edition of the data book continues the tradition of adding new material. Some of this new data has been requested by my office, while so me has been suggested by others. Some examples of new data are:

- International freight energy use for selected countries (Table 1.11)
- $\quad$ More truck data (Tables 3.26, 3.27, 3.28, 3.29, and 3.30)
- 1996 data for auto fuel economy as a function of speed (Table 3.46)
- Employment in motor vehicle related industries (Table 2.33)
- Fleet vehicles operated by fuel providers (Tables 5.4, 5.5, and 5.6)
- A map and list of clean cities (Figure 7.1)
- Intermodel rail traffic (Table 6.11)
- $\quad$ States with ethanol tax incentives (Table 5.19)

Take a look at this new data, and make suggestions of what you would like to see in future editions.

## ACKNOWLEDGEMENTS

We would like to express o ur gratitude to the many individuals who assisted in the preparation of this document. First, we would like to thank Philip D. Patterson and the staff of the Office of Transportation Technologies for their con tinued support of the Transportation Energy Data Book. This document also benefits from the criticism and careful review of Phil Patterson of the U.S. Department of Energy, John Maples, Robert Gibson, and Jenn y Young of the University of Tennessee, Lee Schipper of Lawrence Berkeley Laboratory and Jerry Hadder of Oak Ridge National Laboratory (ORNL). We would also like to thank An Lu of the University of Tennessee for generating statistics from the ORNL MPG and Market Shares Data Base and David Greene (ORNL) for providing the Transportation Energy Trends Analysis.

In addition, we would like to acknowledge the contributions of Sherry Campbell of the ORNL Health Sciences Research Division for the preparation of the title index.

#### Abstract

The Transportation Energy Data Book: Edition 16 is a statistical compendium prepared and published by Oak Ridge National Laboratory (ORNL) under contract with the Office of Transportation Technologies in the Department of Energy (DOE). Designed for use as a desk-top reference, the dat a book represents an assembly and display of statistics and information that characterize transportation activity, and presents data on other factors that influence transportation energy use. The purpose of this document is to present relevant statistical data in the form of tables and graphs. Each of the majo r transportation modes is treated in separate chapters or sections. Chapter 1 compares U.S. transportation data with data from other countries. Aggregate energy use and energy supply data for all modes ar e presented in Chapter 2. The highway mode, which accounts for over three-fourths of total transportation energy consumption, is dealt with in Chapter 3 . Topics in this chapter include automobiles, trucks, buses, fleet vehicles, federal standards, fuel econo mies, and high-occupancy vehicle lane data. Household travel behavior characteristics are displayed in Chapter 4. Chapter 5 contains information on alternative fuels and alternative fuel vehicles. Chapter 6 covers the major nonhighway modes: air, water, and rail. The last chapter, Chapter 7, presents data environmental issues relating to transportation.

## INTRODUCTION

In January 1976, the Transportation Energy Conservation (TEC) Division of the Energ y Research and Development Administ ration contracted with Oak Ridge National Laboratory (ORNL) to prepare a Transportation Energy Conservation Data Book to be used by TEC staff in their evaluation of current and proposed conservation strategies. The major purposes of the data book were to dra w together, under one cover, transportation data from diverse sources, to resolve data conflicts an d inconsistencies, and to produce a comprehensive documen $t$. The first edition of the TEC Data Book was published in October 1976. With the passage of the Department of Energy (DOE) Organization Act, the work being conducted by the former Transportation Energy Conservation Division fell under the purview of the DOE's Office of Transportation Programs (now the Office of Transportation Technologies). DOE, through the Office of Transportati on Technologies, has supported the compilation of Editions 3 through 16.

Policymakers and analysts need to be well-informed about activity in the transportation sector. The organization and scope of the data bo ok reflect the need for different kinds of information. For this reason, Edition 16 updates much of the same type of data that is found in previous editions.

Chapter 1 contains information which compares U.S. transportatio $n$ data with data from selected countries in Asia, Europe, and North America. Chapter 2, Transportation Energy Characteristics , presents aggregate energy use data for each of the major transportation modes (i.e., highway, air, water, pipeline, and rail), as well as related statistics on the price and supply of transportation fuels. Chapter 3 covers detailed statistics on three major highway modes: automobiles, trucks, and buses. Als o contained in this chapter is information on fleets, federal standards, fuel economies of highway vehicles, and high-occupancy vehicle lanes. Household tra vel behavior characteristics are displayed in Chapter 4. Chapter 5 presents data on alternative fuels and alternative fuel vehicles, and Chapter 6 consists of data for the major nonhighway modes: air, water, and rail. Chapter 7 contains information on environmental issues which are pertinent to the transportation industry. Sour ces used represent the latest available data.

In any attempt to compile a comprehensive set of statistics on transportation activity, numerous instances of inadequacies and inaccuracies in the basic data are encountered. Where such problem s occur, estimates are developed by ORNL. To minimize the misuse of these statistics, an appendi x (Appendix A) is included to document the estimation procedures. The attempt is to provide sufficient
information for the conscientious user to evaluate the estimates and to form his or her own opinions as to their utility. Clearly, the accuracy of the estimates cannot exceed the accuracy of the primary data, an accuracy which in mo st instances is unknown. In cases where data accuracy is known or substantial errors are strongly suspected in the data, the reader is alerted. In all cases it should be recognized that the estimates are not precise.

The majority of the statistics contained in the data book are taken directly from publishe d sources, although these data may be reformatted for presentation by ORNL. Consequently, neithe r ORNL nor DOE endorses the validity of these data.

## CHAPTER 1

## INTERNATIONAL TRANSPORTATION STATISTICS

This chapter includes statistics related to the transportation sector of selected countries. Countries were included based on data availability, geographical distribution, and transportation fuel use as a percentage of total refined petroleum consumption. The statistics presented for the United States in this chapter are from international sources and are only for use in international comparisons. The numbers may differ slightly from data presented in other chapters of the book.

Data from the Lawrence Berkeley Laboratory (LBL) are contained in Tables 1.5 through 1.13. These data are generated by LBL using sources from various countries; a listing of these sources, along with a brief explanation, can be found in Appendix C. Often, additional data from the country will result in changes for the entire data series; such changes are noted in Appendix C. Details on the methodology for compiling these data can be found in "Energy Efficiency and Human Activity," by Lee Schipper, Steve Meyers, et. al., Cambridge University Press, Cambridge, MA, 1992, the "Proceedings of the ACEEE Conference on Automobiles and the Greenhouse Effect," and "New Car Test and Actual Fuel Economy: Yet Another Gap?" by Lee Schipper and Wienke Tax, 1993.

LBL has recently generated a new series of freight data for the various countries. Freight energy use data for truck, ship, and rail modes are displayed in Table 1.11.

Using national travel surveys, LBL compiled vehicle-mile and passenger-mile data by trip purpose for seven countries. As with most international data, caution should be used when comparing between countries because of differences in survey methodologies, definitions, etc.

According to the best available data, new cars in Denmark have the highest fuel economy of the listed countries. Caution should be used, however, when comparing fuel economy data between countries because each country may use different methods of calculating new car fuel economy. The data, therefore, may not be directly comparable.

Because each country may use different methods of calcula ting fuel economies, caution should be used when comparing fuel economy data among countries. The data for the United States were generated specifically for international comparisons and should be used only for that purpose; they are not consistent with other domestic fuel economy figures.

"There is a relatively consistent shortfall or gap between tested fuel economy and that actually achieved by consumers on the road ... a gap which changes over time." The International Energy Studies Program at Lawrence Berkeley Laboratory (LBL) has studied this gap and discovered that "despite differences in test measurement methods and data collection and analysis techniques, significant similarities exist between countries on the gap problem." a The gap arises for several reasons, including driver behavior, seasonal differences, and city to highway driving proportion.

## Sources:

Compiled by Lawrence Berkeley Lab from: U. S. National Personal Transportation Survey (NPTS) for year 1990; United Kingdom National Travel Survey 1989/91; Swedish Travel Patterns Survey, Resvaneundersokningen, 1984; The German Kontiv, 1987; Dutch National Mobility Survey, De Mobiliteit van de Nederlandse bevolking, 1992 RVU Denmark. See Appendix C.

## Notes:

The U. S. NPTS survey excludes people under 5 years old ( $7.6 \%$ of the U. S. population for 1990); German Kontiv excludes children under 6 years ( $5 \%$ of total Pop. by 1989); Dutch NTS excludes children under 12 years ( $19 \%$ of Dutch Pop. by 1990); Danish NTS excludes persons under 15 years of age ( $17 \%$ of Pop. by 1992); Swedish NTS excludes persons under 15 years of age ( $18 \%$ of Pop. by 1984).

Special Note: The way in which the Norwegian Travel Survey data was arranged in its final report did not report VMT values by mode and purpose.
${ }^{\text {a }}$ Data are not available.

Compiled by Lawrence Berkeley Lab from: U. S. National Personal Transportation Survey (NPTS) for year 1990; United Kingdom National Travel Survey 1989/91; Swedish Travel Patterns Survey, Resvaneundersokningen, 1984; The German Kontiv, 1987; Dutch National Mobility Survey, De Mobiliteit van de Nederlandse bevolking, 1992 RVU Denmark. See Appendix C.

## Notes:

The U. S. NPTS survey excludes people under 5 years old ( $7.6 \%$ of the U. S. population for 1990); German Kontiv excludes children under 6 years ( $5 \%$ of total Pop. by 1989); Dutch NTS excludes children under 12 years ( $19 \%$ of Dutch Pop. by 1990); Danish NTS excludes persons under 15 years of age ( $17 \%$ of Pop. by 1992); Swedish NTS excludes persons under 15 years of age ( $18 \%$ of Pop. by 1984.

Special Note: The way in which the Norwegian Travel Survey data was arranged in its final report did not report VMT values by mode and purpose.

## CHAPTER 2 TRANSPORTATION ENERGY CHARACTERISTICS

The U.S. is responsible for more than one-quarter of the world's petroleum consumption. Domestic crude oil production is at the lowest level in the last 25 years. While domestic crude oil production has declined $27 \%$ from 1985 to 1995, the amount of crude oil imported has more than doubled in that time period to meet the domestic demand. Net imports of crude oil and petroleum products in 1995 accounted for $45 \%$ of U.S. petroleum consumption (Table 2.2). Most of the petroleum consumed in the U.S. was in the transportation sector, $67 \%$ (Table 2.5). This accounted for $27.5 \%$ of total energy use in 1995 (Table 2.9).

The fuels used in the transportation sector include gasoline, distillate fuel oil (diesel fuel), jet fuel, residual fuel oil, natural gas, electricity, and methanol. Gasoline, however, accounted for the majority of transportation energy consumption in 1994. Of total transportation energy use in 1994, 76\% was consumed by the highway mode while the nonhighway mode (which includes water, air, pipeline, and rail transportation) accounted for $21 \%$. The remaining $3 \%$ of transportation energy use was consumed by the off-highway mode (Table 2.11).

The results of a study sponsored by the Office of Energy Demand Policy, U.S. Department of Energy, are presented in Tables 2.18-2.20. The study of Transportation Energy Trends Analysis uses a mathematical technique known as Divisia analysis to decompose energy use trends. Further discussion of this study is found on page 2-19.

The average price of a new car in 1994 reached $\$ 19,676$. The average price for an import car has been more than the average price for a domestic car since 1982. Before then, imports were priced less than domestics, on average (Table 2.30). The cost of operating a car (in 1990 dollars) was 41.5 cents per mile in 1994. Gas and oil, once as much as one-quarter of the total cost to operate a car, accounted for only $12 \%$ of the total cost in 1994 (Table 2.30).

There were 2.6 motor vehicle manufacturing employees per hundred vehicles sold in 1994, which is the lowest ratio in the 23 year series. In 1981, there were 4.5 employees per hundred vehicles sold (Table 2.32). Employees of motor vehicle and related industries declined 2.1\% from 1990 to 1992 (Table 2.33).

Washington, DC, Table 2.2, p. 25.
${ }^{\text {an }}$ Electrical energy losses have been distributed among the sectors.

Although the automobile energy use for 1994 is lower than in 1993 [Edition 15], it is due to a reclassification of minivans and sport utility vehicles by the Federal Highway Administration rather than a real usage decline. The sum of automobiles and light trucks will still produce a consistent trend. New LPG shares from the 1992 Truck Inventory and Use Survey indicate an increase in truck LPG use.

${ }^{\text {a }}$ Beginning in 1993, data became available on alternative fuel use by transit buses.
${ }^{\text {b }}$ Light trucks include only those trucks which have 2-axles and 4-tires. Starting in 1993, this category includes minivans and sport utility vehicles
${ }^{\text {c }}$ These data have changed from previous editions due to a change in source for Class I freight railroad energy use. Previous estimates were based on sales.
${ }^{\mathrm{d}}$ Total transportation figures do not include military and off-highway energy use and may not include all possible uses of fuel for transportation (e.g. snowmobiles).

The Federal Highway Administration cautions that 1993 and 1994 data may not be directly comparable to eariler years. Some states have improved reporting procedures in recent years, and the estimation procedures were revised for 1994.

Table 2.13
Highway Usage of Gasoline and Special Fuels, 1973-94
(million gallons)

| Year | Gasoline | Gasohol | Total Gasoline and Gasohol | Special fuels ${ }^{\text {a }}$ | Percent special fuels | Total highway fuel use |

## Source:

U.S. Department of Transportation, Federal Highway Administration, Highway Statistics 1994, Washington, DC, 1995, pp. I-3, I-6, and annual.
Total highway fuel use - calculated as the sum of gasoline and special fuels.
${ }^{\text {a }}$ Special fuels consist primarily of diesel fuel, with small quantities of liquified petroleum gas.
${ }^{\mathrm{b}}$ Data for gasoline and gasohol cannot be separated in this year.

Comparing energy intensity data between modes should be done with caution. These national estimates are generated from the bes $t$ available data, but individual circumstances play a major role in energy intensity. Influences such as locality and equipment ca $n$ significantly change energy intensity.

## Transportation Energy Trends Analysis

Since the first oil price shock in October of 1973, important changes have occurred in the way energy is used in the U.S. transportation system. Knowing how and how much transportation energy use has changed is important to understanding how the system responds to energy challenges and how it is evolving as a result of long-term social economic, and technological trends. As a first level of analysis, changes in transportation energy use can be decomposed intochanges due to: 1) growth in transportation activity, 2) changes in the distribution of activity across modes, and 3) changes in the energ intensiveness of transport modes. A mathematical technique known as Divisia analysis can be used to rigorously decompose energy use trends (see, e.g., Greene and Fan, 1994). This technique is used here to look at the sector as a whole, at a high level of generality, and to look in increasing detail at passenger and freight movements.

For each analysis a table and figure are displayed. The tables show actual energy use by year in the first column, followed by the level of energy use that would have been required for that year if the actual level of transportation activity had taken place at 1972 average energy intensity (the "trended energy use"). Next comes the total change in energy use from the previous year, followed by the components of change. The components will add up to the total change, except for rounding. Note that the components will tend to increase in absolute value over time, al else equal, as activity levels increase. Finally, the level of activity is shown. In the figures, trendedenergy use and actual energy use are plotted as dashed and solid lines, respectively. Below are bars showing the individual components, factor tending to increase energy use projected above zero, those tending to decrease it projected below zero. The sum of the bars in each year exactly equals the difference between the trended and actual energy use.

This work was performed by Oak Ridge National Laboratory for the U.S. Department of Energy, Office of Energy Demand Policy.

Overall transportation energy use increased by five quads from 1972 to 1994, from 17.9 to 23.4 quads. Energy use would have been 4 quads ( $17 \%$ ) higher, had energy intensiveness not been reduced. Note that there is little differenc e between actual and trended energy use in the first decade from 1972 to 1982, and that the two curves diverge thereafter. This implies tha the energy intensity of transportation changed very little during the first decade following the init ial oil price shock of 1973-74. The changes in transportation energy use during that period were due primarily to changes in the amount of transportation activity. In other words, response to the initial price shock ca me largely in the form of traveling less and shipping less. The fact that energy efficiency improvements did not come until after the second price shock in 1979-80 is largely due to the fact that it takes a long time to change the energy using technology embodied i $n$ transportation equipment. Not only do tr ansportation vehicles last a decade and often considerably more, but it takes additional time for manufacturers to redesign and retool to produce more efficient vehicles.

Energy intensity Modal structure Actual energy use Trended energy use

Source: See Table 2.18

The decomposition of energy use in passenger travel looks very similar to that of total transportation. This is because, 1) passenger travel accounts for $70 \%$ of total transportation energy use, and 2) there appears to have been little overall change in freight energy intensity, as is shown in the following material. Energy use for passenger travel is 3.6 quads (22\%) less than it would have been at 1972 energy intensities.

Figure 2.4. Changes in PassengerTransportation Energy Use, 1972-94 Modal Energy Intensity and Modal Structure Effects

Energy intensity Modal structure Actual energy use Trended energy use

Source: See Table 2.19

The most interesting aspect of trends in highway passenger energy use is the fact that very large potential gains due to vehicle fuel economy have been cut more than in half by decreasing vehicle occupancy rates. Highway passenger energy use would have been $50 \%$ higher had there been no improvement in vehicle miles per gallon. A persistent, gradual trend of fewer passengers per vehicle offset 4.0 quads (58\%) of the potential energy savings due to vehicle fuel economy. The vehicle occupancy data come from the Nationwide Personal Transportation Survey conducted approximately every five years. Thus, true year-toyear changes cannot be captured. Nonetheless, the trend of steadily declining vehicle occupancy rates is clearly reflected in every survey. Changes in the distribution of travel among vehicle types has also tended to increase energy intensiveness, though by less than 5\%; increasing popularity of light trucks is largely responsible.

Had there been no reduction in the energy intensity of air travel since 1972, commercial airlines would be using over twice as much jet fuel as they are today: 4.9 instead of 2.3 quads. This remarkable increase in the energy efficiency of air travel was achieved through a combination of aircraft and load factor improvements. Reduced energy use per seat-mile, accomplished by simultaneously reducing energy use per aircraft mile and increasing aircraft size (average number of seats per aircraft), accounted for nearly three quarters of the reduction in energy use per passenger. Higher load factors (average seat occupancy rates) provided the rest of the savings.

Figure 2.6. Changes in Air Passenger Transportation Energy Use, 1972-94 Seat-Miles Efficiency and Load Factor Effects

Source: See Table 2.21.

Before reviewing the freight transportation energy decomposition, we note that the quality of estimates of freight ton-miles tends to be poor, especially for the highway mode which is by far the largest energy user. Since energy use per ton-mile is the basic measure of energy intensity, this argues for caution in drawing firm conclusions about the freight sector Divisia analysis. With that in mind, the data indicate that at 1972 energy intensities, 1994 freight movements would have required almost the same amount of energy as was actually used in 1994. That is, not much improvement in energy intensity is indicated. An improvement in energy use per ton-mile within individual modes appears to have been wiped out by a gradual shift in traffic to the more energy intensive modes (highway and air).

Energy intensity Modal structure Actual energy use Trended energy use

Source: See Table 2.22.

In sharp contrast to overall freight energy trends, rail energy use per ton-mile has been dramaticall y improved. At 1972 energy intensity per ton-mile, 1994 rail freight movements would have required nearly twice as much energy ( 0.86 quads versus 0.47 quads actually used). Higher car-loadings are primarily responsible. More than any other mode, rail freight appears to have increased its energy efficiency by improving the efficiency of operations. Energy use per car-mile was also reduced, however, despite the increase in ton-miles per car-mile.

Diesel - U.S. Department of Energy, Energy Information Administration, International Energy Annual 1993, Washington, DC, May 1995, pp. 94.
${ }^{\text {a }}$ Collected from a survey of prices on January 1 of the current year.
${ }^{\text {b }}$ These prices were collected from a sample of service stations in 85 urban areas selected to represent all urban consumers. Urban consumers make up about $80 \%$ of the total U.S. population.
${ }^{\text {c Adjusted by the Consumer Price Inflation Index. }}$
${ }^{\text {d }}$ Data are not available.
${ }^{\text {e}}$ Average annual percentage change is for years 1980-94 and 1985-94.
${ }^{\mathrm{f}}$ Average annual percentage change is for years 1981-95.

The fuel prices shown here are refiner sales prices of transportation fuels to end users, excluding tax. Sales to end users are those made directly to the ultimate consumer, including bulk consumers. Bulk sales to utility, industrial, and commercial accounts previously included in the wholesale category are now counted as sales to end users.
Prices for alternative fuels are found in Chapter 5.

Sources:
U.S. Department of Energy, Energy Information Administration, Monthly Energy Review, April 1996, Washington, DC, Table 9.7, p. 117.

[^11]The average price of a barrel of crude oil (in constant 1990 dollars) declined by $33.5 \%$ from 1990 to 1995, while the average price of a gallon of gasoline declined only $15.1 \%$ in this same time period. There could be many reasons for this difference-for example, Federal and State gasoline tax increases and differences in crude oil processing cost.

1970-86 data - U.S. Department of Commerce, Bureau of Census, Statistical Abstract of the United States 1988, p. 412 .

1987-94 data - U.S. Department of Commerce, Bureau of Economic Analysis, Survey of Current Business, July 1995, Table 2.2, p. 12, and annual.
${ }^{a}$ Transportation Personal Consumption Expenditures include user operating expenses (new and used auto purchases, gas and oil, repair, greasing, washing, parking, storage, rental, other motor vehicles, tires, tubes and other parts, insurance premiums); purchased intercity transportation; and purchased local transportation.
${ }^{\mathrm{b}}$ Adjusted by the implicit GNP price deflator.

The Consumer Price Index (CPI) for transportation has almost quadrupled from 1970 to 1995; and the Used Car CPI continued to grow at a much faster rate than did the New Car CPI. This means that while consumers paid for a new automobile in 1995 more than double what they did in 1970, they paid over five times more to buy a used car in 1995 than in 1970.

[^14]After adjusting for inflation, the average price of domestic new cars declined from 1992 to 1993, but rose to an even higher level in 1994. Average domestic car prices in 1970 were $\$ 3,567$ more than imports (in constant 1990 dollars), but in 1994, domestic car prices were $\$ 5,499$ less than imports.

[^15]The total cost of operating an automobile is the sum of the fixed cost (depreciation, insurance, finance charge, and license fee) and the variable cost, which is related to the amount of travel. The cost of operating a car in 1995 (constant 1990 cents) was approximately 42 cents per mile. From 1985 to 1995 the fixed costs have risen an average of $3.7 \%$ per year while the variable costs have declined at an average annual rate of $1.3 \%$. Gas and oil accounted for only $12 \%$ of total cost per mile in 1994, the lowest percentage in the 18 year series.

## CHAPTER 3 <br> HIGHWAY MODE

Highway energy use represented $75.9 \%$ of transportation energy use in 1994. Of the highway modes, automobiles had the greatest share of energy use, $39.2 \%$ (Table 3.1). The automobiles were also responsible for the majority of vehicle miles traveled in 1994. Light trucks with two axles and four tires have experienced the largest increase in vehicle miles traveled, an average of $6.7 \%$ annually from 1970 to 1994 (Table 3.2).

The number of automobiles and trucks in use are reported by both the Federal Highway Administration and R. L. Polk and Company (Table 3.4). According to R. L. Polk, the number of automobiles in the U. S. declined from 1991 to 1992. A discussion of this decline and of differences between the two sets of estimates can be found on page 3-5.

Automobile sales have been on the increase since 1992, mainly due to domestic sales. Import sales have declined each year since 1985; Transplants, however, have increased by $7.9 \%$ in that time period. Fuel economy for the automobile population has increased from 13.5 miles per gallon in 1970 to 21.5 miles per gallon in 1994 (Table 3.10). As the older autos are scrapped, they are replaced with newer, more fuel efficient autos which help to raise the population fuel economy. The sales-weighted fuel economy for new automobiles was at 27.9 mpg for the 1994 sales period (Table 3.16).

Truck travel data are based mainly on the Truck Inventory and Use Survey (TIUS) conducted by the U.S. Bureau of the Census. As part of the nation's economic surveys, TIUS is required by law to be conducted every 5 years for the years ending in 2 and 7 to provide data on the physical and operational characteristics of the nation's truck population. The survey is based on a probability sample of private and commercial trucks registered (or licensed) in each state. The most recent survey for which results are available was conducted in 1992. In addition to trucks, the following types of vehicles were also included in the 1987 and 1992 surveys: minivans, vans, station wagons, and jeep-like vehicles. The 1977 and 1982 surveys did not include those vehicle types. The estimated number of trucks that were within the scope of the TIUS and registered in the U.S. as of July 1, 1992 was 59.2 million. These trucks were estimated to have been driven a total of 786.3 billion miles during 1992, an increase of $33.7 \%$ from 1987. The average annual miles traveled per truck was estimated at 11,900 miles.

Although the average Corporate Average Fuel Economy (CAFE) of automobiles and light trucks has met the CAFE standard most years (there are two exceptions), there are still manufacturers who fall short of meeting the standard. Since 1986 the Gas Guzzler tax has been assessed on automobiles with a fuel economy rating of less than 22.5 miles per gallon. These tax rates, which remained constant from 1986 to 1990, doubled in 1991 (Table 3.44).

## VEHICLES IN USE

Both the Federal Highway Administration (FHWA) and R. L. Polk and Company report figures on the automobile and truck population each year. The two estimates, however, differ by as much as $25.6 \%$ for trucks (1992). The differences can be attributed to several factors, such as:

- The FHWA data include all vehicles which have been registered at any time throughout the calendar year. Therefore, the data include vehicles which were retired during the year and may double count vehicles which have been registered twice in different or the same states. The R. L. Polk data include only those vehicles which are registered on July 1 of the given year.
- The classification of mini-vans, station wagons on truck chassis, and utility vehicles as passenger cars or trucks has proven to make differences in the two estimates. The R. L. Polk data included passenger vans in the automobile count until 1980; since 1980 all vans have been counted as trucks. Recently, the Federal Highway Adminstration adjusted their definition of automobiles and trucks. Starting in 1993, some minivans and sport utility vehicles that were previously included with automobiles were included with trucks. This change produced a dramatic change in the individual percentage differences of cars and trucks. The difference in total vehicles has been less than 5\% each year since 1990 and does not appear to be significantly affected by the FHWA reclassifications.
- The FHWA data include all non-military Federal vehicles, while the R.L. Polk data include only those Federal vehicles which are registered within a state. Federal vehicles are not required to have State registrations, and, according to the General Services Administration, most Federal Vehicles are not registered.

According to the R. L. Polk statistics, the number of passenger cars in use in the U.S. declined from 1991 to 1992. This is the first decline in vehicle stock since the figures were first reported in 1924. However, the data should be viewed with caution. A redesign of Polk's approach in 1992 allowed a national check for duplicate registrations which was not possible in earlier years. Polk estimates that due to processing limitations, it's vehicle population counts may have been inflated by as much as $11 / 2$ percent. Assuming that percentage is correct, the number of passenger cars in use would have declined from 1991 to 1992 under the previous Polk method. Meanwhile, the FHWA estimates indicated growth in both the number of passenger cars and trucks from 1991 to 1992.

${ }^{\text {a }}$ Some minivans and sport/utility vehicles are included in with the trucks that were previously included in with the automobiles.

In 1994 the average and median ages of automobiles and trucks were the same. Truck ages, which have always averaged higher than automobiles, dropped slightly from 1993 to 1994, while automobile ages increased slightly.

## Source:

R. L. Polk and Co., Detroit, MI. FURTHER REPRODUCTION PROHIBITED.

Vehicle travel - Average annual miles per auto by age were multiplied by the number of vehicles in operation by age to estimate the vehicle travel. Average annual miles per auto by age - generated by ORNL from the Household Vehicle Energy Consumption, 1994, provided by the U.S. Department of Energy, Energy Information Administration, Office of Markets and End Use, Energy End Use Division, 1996.

[^20]Starting in 1993, the Federal Highway Administration (FHWA) revised their definitions of passenger cars and 2-axle, 4-tire trucks. The result was a dramatic decrease in cars and increase in 2-axle, 4-tire trucks. The sum of these two categories will still produce a consistant trend. ${ }^{a}$ The FHWA plans to release revised historical data for each of these categories in the Spring of 1997.

${ }^{a}$ See Table 3.22 for truck data.
${ }^{\mathrm{b}}$ This number differs from R. L. Polk's estimates of "number of automobiles in use." See Table 3.4.
${ }^{\text {c }}$ Fuel economy for automobile population.
${ }^{\mathrm{d}}$ Some minivans and sport/utility vehicles are included with 2-axle, 4-tire trucks that were previously included with passenger cars.

The data from the Nationwide Personal Transportation Study (NPTS) is based on estimates by survey respondents. The Residential Transportation Energy Consumption Survey (RTECS) data, which represents actual odometer readings of automobiles, has little bias from respondent estimations and, therefore, is the preferred data.

Information Agency, Office of Markets and End Use, Energy End Use Division.
${ }^{\text {a }}$ Includes only auto vehicles (standard auto, station wagon, taxi, and van-bus/minibus) owned by or available to the household on a regular basis.
${ }^{\mathrm{b}}$ Includes all household vehicles-automobiles, station wagons, pick-up trucks, vans, and utility vehicles.

The average weight of the domestic automobile has been reduced nearly 290 pounds from 1978 to 1995, but increased slightly from 1985 to 1995. Much of the weight reduction was due to the declining use of conventional steel and iron and the increasing use of aluminum and plastics. Conventional steel, however, remained the predominant component of automobiles in 1995 with a $43.6 \%$ share of total materials. As conventional steel use has been decreasing, use of high-strength steel has increased.

R. L. Polk and Co., Detroit, MI. FURTHER REPRODUCTION PROHIBITED.

Vehicle travel-The average annual vehicle miles per truck by age were multiplied by the number of trucks in operation by age to estimate the vehicle travel. Average annual miles per truck by age were generated by ORNL from the 1992 Truck Inventory and Use Survey public use tape provided by U.S. Department of Commerce, Bureau of the Census, Washington, DC, 1995.

${ }^{a}$ These figures represent only those sales that could be matched to corresponding EPA fuel economy values.
${ }^{\mathrm{b}}$ Revised.

Starting in 1993, the Federal Highway Administration (FHWA) revised their definitions of passenger cars and 2-axle, 4-tire trucks. The result was a dramatic decrease in cars and increase in 2-axle, 4-tire trucks. The sum of these two categories will still produce a consistant trend. (See Table 3.10 for car data.) The FHWA plans to release revised historical data for each of these categories in the Spring of 1997.

U.S. Department of Transportation, Federal Highway Administration, Highway Statistics 1994, Washington, DC, 1995, Table VM-1, p. V-115, and annual.
${ }^{\text {a }}$ The Federal Highway Administration changed the combination truck travel methodology in 1993.
${ }^{\text {b }}$ Other single-unit trucks are defined as all single-unit trucks with more than two axles or more than four tires.
${ }^{\mathrm{c}}$ The fuel economy for combination trucks is not the same as the fuel economy for Class 8 trucks. Fuel economy for Class 8 trucks is shown in Table 3.24.

## Truck Inventory and Use Survey

The Truck Inventory and Use Survey (TIUS) provides data on the physical and operational characteristics of the Nation's truck population. It is based on a probability sample of private and commercial trucks registered (or licensed) in each state. Data for 1992 have recently been released in a report, as well as on CD-ROM. Copies may be obtained by contacting the U.S. Bureau of the Census, Transportation Characteristics Surveys Branch (301)457-2797.

The 1987 and 1992 surveys, in addition to trucks, included minivans, vans, station wagons on truck chassis, and jeep-like vehicles. The 1977 and 1982 surveys did not include those vehicle types. The estimated number of trucks that were within the scope of the 1992 TIUS and registered in the U.S. as of July 1, 1992 was 59.2 million. These trucks were estimated to have been driven a total of 786.3 billion miles during 1992, an increase of $33.7 \%$ from 1987. The average annual miles traveled per truck was estimated at 11,900 miles.

In the 1992 TIUS there are several ways to classify a truck by weight. The survey respondent was asked the average weight of the vehicle or vehicle/trailer combination when carrying a typical payload; the empty weight (truck minus cargo) of the vehicle as is was usually operated; and the maximum gross weight at which the vehicle or vehicle/trailer combination was operated. The Census Bureau also collected information on the Gross Vehicle Weight Class of the vehicles (decoded from the vehicle identification number) and the registered weight of the vehicles from the State registration files. Some of these weights are only provided in categories, while others are exact weights. Since all these weights could be quite different for a single truck, the tabulations by weight can be quite confusing. For illustration of this, see Tables 3.25 and 3.26. The first set of data are based on the average weight as reported by the respondent; the data on Table 3.26 are based on the Gross Vehicle Weight Class on the vehicle when it was manufactured. There is a $22.8 \%$ difference in the number of Class 1 trucks. In most tables, the Gross Vehicle Weight Class was used. However, on the tables comparing between surveys average weight must be used, as the older surveys did not include data on the Gross Vehicle Weight Rating.

Table 3.24
Truck Fuel Economy by Size Class, 1977, 1982, 1987, and 1992 (miles per gallon)

|  |  | 1977 |  | 1982 | 1987 |
| :---: | :--- | ---: | :---: | :---: | :---: |
| Size class | Average weight | TIUS | TIUS | TIUS | TIUS |

See Appendix A for Table 3.31.
${ }^{\text {a }}$ Data for Transit buses after 1983 is not comparable with prior data. Data for prior years were provided voluntarily and statistically expanded, but in 1984 reporting became mandatory.
${ }^{b}$ Data are not available.
${ }^{\text {c Beginning in }} 1993$ data became available on alternative fuel use by transit buses.

Automobile fleet data are difficult to estimate, but progress is made each year in compiling fleet estimates. In the mid-eighties it was discovered that daily rental fleets from 1970 to 1983 had been grossly underestimated. Now, newly available data dictate changes in the number of business fleets, individually leased fleets, government fleets, and utility fleets in 1993. Since these data are not historically consistent, please use caution when comparing 1993-94
data to earlier years.

[^25]The average cost per mile for the operation of sedans, trucks, and all vehicles decreased in FY 1994. On average, sedans were driven nearly twice the miles that trucks were driven.

## Profile of Motor-Vehicle Fleets in Atlanta 1994

Because of concerns about energy security and clean air, the Energy Policy Act of 1992 directed the Energy Information Administration (EIA) to collect data that would be useful in assessing the market for vehicles powered by alternatives to motor gasoline and diesel fuel. A 1994 survey conducted in metropolitan Atlanta was designed to draw a profile of private company and local government fleets in a major metropolitan area.

The survey area was the Atlanta nonattainment area, as defined by the 1990 Clean Air Act Amendments. In 1990, about one percent of the U.S. population resided in the Atlanta nonattainment area. The area represents the Atlanta Metropolitan Statistical Area (MSA), excluding five counties, with relatively small populations, which are on the outer ring of the MSA.

Out of the estimated 102,146 vehicles operated by private companies and local governments, one percent were fueled by an alternative fuel such as ethanol, methanol, natural gas, propane, or electricity. The majority of the vehicles in the survey were gasoline and diesel vehicles operated in private company fleets. Selected data from the report, for these vehicles, are presented in Tables 3.38-3.40.

Source: Energy Information Administration, Office of Energy Markets and End Use, Form EIA-890, Profile of Motor-Vehicle Fleets in Atlanta 1994, DOE/EIA-0601, November 1995, (http://www.eia.doe.gov).

A private company fleet for this survey was defined as any group of six or more vehicles owned or operated by private companies and operated out of a base location/locations in the 13-county nonattainment area of Atlanta. Employeeowned vehicles and short-term rental vehicles were excluded. Vehicle leasing companies were excluded to avoid double counting leased vehicles operated by private companies.

${ }^{\text {a }}$ Buses are included in totals but are not shown because the Relative Standard Error is equal to or greater than 50 percent, or data were reported for fewer than five fleets.
${ }^{\mathrm{b}}$ Withheld because Relative Standard Error is equal to or greater than $50 \%$, or data were reported for fewer than 5 fleets.
${ }^{\mathrm{c}}$ No case reported.

A private company fleet for this survey was defined as any group of six or more vehicles owned or operated by private companies and operated out of a base location/locations in the 13-county nonattainment area of Atlanta. Employee-owned vehicles and short-term rental vehicles were excluded. Vehicle leasing companies were excluded to avoid double counting leased vehicles operated by private companies.

With a few exceptions, the sales-weighted fuel economies of automobiles and light trucks have, on average, met the fuel economy standards set by the federal government. This does not mean, however, that each manufacturer has met the standards each year. Some manufacturers still fall short, while others exceed the standards. In 1994 the light truck (combined) fuel economy estimate fell 0.2 mpg short of the standard.

## New Data by Vehicle Speed

ORNL is presently conducting a project for the Federal Highway Administration to develop vehicle fuel consumption and emissions models and databases for use in FHWA's TRAF-NETSIM model. In the project, 15 to 20 light-duty vehicles will be thoroughly characterized for their fuel consumption and emissions over most of their operating ranges. The vehicle characterizations will be represented in tables of fuel consumption and emissions as functions of vehicle speed and acceleration. To acquire the data, each vehicle will be instrumented and tested on-road and on a chassis dynamometer. Emissions and fuel consumption measurements will be made while driving the vehicles on the dynamometer, and these data will be married with actual onroad speed and acceleration measurements.

Tests of four vehicles have been completed thus far, including a 1994 Oldsmobile Cutlass, 1994 Oldsmobile Eighty-Eight, 1994 Mercury Villager minivan, and a 1994 Geo Prizm. Other vehicles to be tested include more light trucks and some smaller cars. Preliminary results of steady-speed fuel consumption tests indicate that peak fuel economy occurs at higher speeds than in older vehicles tested in previous studies.

The two earlier studies by the Federal Highway Administration (FHWA) indicate maximum fuel efficiency was acheived at speeds of 35 to 40 mph . The preliminary data of the recent FHWA study indicate greater fuel efficiency at higher speeds. Note that the 1973 study did not include light trucks.

Figure 3.2. Fuel Economy by Speed, 1973, 1984, and 1996

Source: See Table 3.46.

All of the tested vehicles showed over $18 \%$ fuel economy loss from 55 to 75 miles per hour (mph). From 65 to 75 mph , the Olds 88 indicated a $20 \%$ decline in fuel economy, nearly double the loss of the Villager or the Prizm. Please see Page 3-45 for details on this study.

U.S. Department of Transportation, Federal Highway

Administration, Highway Statistics 1993, Washington, DC, 1994, Table VS-1, p. V-137, and annual.
${ }^{\text {a}}$ Data from 1970-79 represent only free-moving traffic, on level, straight, uncongested sections of Interstate. Beginning with fiscal year 1980, the data show the speeds of all vehicular traffic.
${ }^{\mathrm{b}}$ Data are not available.

The Environmental Protection Agency (EPA) tests new vehicles to determine fuel economy ratings. The city and highway fuel economies that are posted on the windows of new vehicles are determined by testing the vehicle during these driving cycles. The driving cycles simulate the performance of an engine while driving in the city or on the highway. Once the urban cycle is completed, the engine is stopped, then started again for the 8.5 minute hot start cycle.

Figure 3.4. Urban Driving Cycle
Length of cycle: 1870 seconds, including idle time.
Average speed: 21.3 mph with idle; 26.5 mph without idle.

Figure 3.5. Highway Driving Cycle
Length of cycle: 765 seconds.
Average speed: 48.5 mph .

High-occupancy vehicle (HOV) lanes are special highway lanes meant for the exclusive use of vehicles with a specified number of passengers. Vehicles that use HOV lanes are usually guaranteed a shorter and less congested trip than those using regular traffic lanes. Twenty-five areas in the U.S. and Canada had HOV facilities in 1994, and 4 more areas had HOV facilities in development at that time.

## Note:

1993-94 includes Canadian HOV lanes for three cities.

## CHAPTER 4

## PERSONAL TRAVEL STATISTICS

From 1950 to 1994, the average annual rate of increase in the number of vehicles surpassed the increases in population, households, licensed drivers, and employed persons. Since 1986 there has been more than one vehicle for every licensed driver in the U.S. (Table 4.1). An average household spent $18.5 \%$ of total expenditures on transportation in 1994 (Table 4.2).

Results from the Residential Transportation Energy Consumption Survey (RTECS) are found in Tables 4.3-4.7. The RTECS has been conducted six times since 1978 by the Department of Energy's Energy Information Administration. The survey focuses on vehicle miles traveled, energy end-use consumption and expenditures by households for personal transportation. Vehicle travel information is collected by actual odometer readings instead of survey respondents estimates. There were no major changes in survey methodology between the 1988, 1991 and 1994 surveys, but the 1985 and previous RTECS had different estimation procedures for vehicle fuel economy and fuel prices. Therefore, caution should be used when comparing the 1988 and later RTECS to previous years. The 1994 RTECS data were recently released and some of the more detailed data were not yet available to update Tables 4.54.7.

Information on household trips by trip purpose is found in the Nationwide Personal Transportation Survey (NPTS) (Table 4.9). The NPTS is a national survey designed to collect data on the nature and characteristics of personal travel. The definition of a trip in the NPTS is "any one-way travel from one address to another by private motor vehicle, public transportation, bicycle, or walking." Excluded from the survey are jogging and walking for exercise, as well as all bicycling and walking for individuals under 5 years of age. The survey collects detailed data on household trips, their purposes and the transportation modes used. The NPTS is sponsored by several agencies of the U.S. Department of Transportation and is conducted approximately every seven years. Since each of the surveys differ somewhat in terminology, survey procedure, and target population, one should be cautious when comparing statistics from one survey to the next. The last NPTS was conducted in 1995; survey results have not yet been released.

The NPTS and the Decennial Census of the population both provide information on the "journey-to-work." In 1990, $73 \%$ of U.S. workers commuted to work alone in a private vehicle, which is $9 \%$ more than in 1980 (Table 4.12).

Table 4.1
Population and Vehicle Profile, 1950-94

| Year | Resident population ${ }^{\text {a }}$ (thousands) | Total households (thousands) | Number of vehicles in operation (thousands) | Number of licensed drivers (thousands) | Number of civilian employed persons (thousands) | Vehicles per capita | Vehicle miles per capita | Licensed drivers per household | Vehicles per licensed driver | Vehicles per civilian employed persons |

Transportation (18.5\%) is second only to housing (31.1\%) as the largest expenditure for the average household. In 1994, approximately $16 \%$ of transportation expenditures were for purchasing gasoline and motor oil.

Household vehicle ownership shows a dramatic increase from 1960 to 1990. In 1960, nearly $79 \%$ of households owned less than two vehicles; by 1990, it declined to $45 \%$. Census data prior to 1990 indicated that the majority of households owned one vehicle; in 1990 that changed to two vehicles.

${ }^{a}$ Compiled by the Census Bureau, these data on the total number of vehicles do not match the figures on Table 4.1. The figures on Table 4.1, from R.L. Polk and Company, are the preferred data.
"Both annual VMT and annual vehicle trips per household increased by $22 \%$ betwee $n$ 1969 and 1990. Work trips continue to account for the largest proportion of household travel, both in terms of miles and in number of trips. Average vehicle trip lengths, which had been decreasing from 1969 to 1983, showed increases in 1990. The largest increase in trip length was in work trips." a

The average vehicle occupancy, calculated as person miles per vehicle mile, was at its lowest level since 1977 for everytrip purpose. The increased number of vehicles per household and the decrease in average household size could have contributed to the decline.

Figure 4.2. Average Vehicle Occupancy by Trip Purpose 1977, 1983, and 1990 NPTS

According to the U.S. Census data, the percentage of workers who carpooled has dropped from $19.7 \%$ in 1980 to $13.4 \%$ in 1990. The percent of workers using public transit declined from $6.4 \%$ to $5.3 \%$ during the same time period. The average travel time increased by 0.7 minutes from 1980 to 1990.

## CHAPTER 5 ALTERNATIVE FUELS STATISTICS

In 1994, the transportation sector alone used 22.7 quads of petroleum fuels, accounting for $65.4 \%$ of total petroleum consumed in the United States. With decreasing domestic oil production and rising demand, the amount of imported crude oil and petroleum products has increased at an average rate of $5.1 \%$ per year since 1984. In 1994, $50 \%$ of the petroleum consumed in the U.S. was imported. These statistics suggest that reducing the transportation sector's dependence on petroleum fuels will be the key to reducing the nation's dependence on imported petroleum.

In 1988 the Alternative Motor Fuels Act (AMFA) was established to encourage the use of alternative fuels in the U.S. transportation sector. As a result of the AMFA, the Alternative Fuels Data Center (AFDC) was established by the Department of Energy. The AFDC distributes information about alternative fuel vehicles as well as data on refueling sites around the nation. Information about the AFDC, and statistics and maps generated by the AFDC, are presented in this chapter.

The Energy Policy Act (EPACT) of 1992 included alternative fuel mandates. Purchase requirements were set from 1993 forward for the federal and state governments, fuel providers (e.g., natural gas and electric utilities), and the private sector. The federal fleet purchase requirements have already been updated by Executive Order 12844 (see Figure 5.1). Additional rulemaking is required for the private sector alternative fuel vehicle mandates to take effect. The Energy Information Administration, in an effort to learn more about fuel provider fleets which may be impacted by EPACT Section 501, conducted surveys of three fuel provider industries - propane, electricity, and natural gas (Tables 5.4-5.7). An estimate of fuel provider vehicles (all industries) which are potentially covered under EPACT Section 501 is included in Table 5.8.

Since the AMFA, government and industry have made major efforts to advance our knowledge of alternative fuels and alternative fuel vehicles. The U.S. Advanced Battery Consortium (USABC) was established in January 1991 to concentrate efforts on battery development for electric vehicles. The goals of the USABC are presented in Table 5.9.

Fuel type abbreviations are used throughout this chapter. LPG = liquified petroleum gas. CNG $=$ compressed natural gas. $\mathrm{M}-85=85 \%$ methanol, $15 \%$ gasoline. $\mathrm{E}-85=85 \%$ ethanol, $15 \%$ gasoline. $\mathrm{M}-100=100 \%$ methanol. $\mathrm{E}-95=95 \%$ ethanol, $5 \%$ gasoline. $\mathrm{LNG}=$ liquified natural gas.

## THE ALTERNATIVE FUELS DATA CENTER

The Department of Energy (DOE) has established the Alternative Fuels Data Center (AFDC) in support of its work aimed at fulfilling the Alternative Motor Fuels Act (AMFA) directives. The AFDC is operated and managed by the National Renewable Energy Laboratory (NREL) in Golden, Colorado.

The purposes of the AFDC are

- to gather and analyze information on the fuel consumption, emissions, operation, and durability of alternative fuel vehicles, and
- to provide unbiased, accurate information on alternative fuels and alternative fuel vehicles to government agencies, private industry, research institutions, and other interested organizations.
The data are collected for three specific vehicle types: (1) light-duty vehicles, including automobiles, light trucks, and mini-vans; (2) heavy-duty vehicles such as tractor-trailers and garbage trucks; and (3) urban transit buses. An Oracle Relational Database Management System is used to manage the data, along with a statistical software package capable of providing statistical, graphic, and textual information to users. Several tables and graphs in this chaper contain statistics which were generated by the AFDC. Future editions of the Transportation Energy Data Book will continue to present graphical and statistical information from the AFDC.

The Department of Energy is now sponsoring the National Alternative Fuels Hotline for Transportation Technologies in order to assist the general public and interested organizations in improving their understanding of alternative transportation fuels. The Hotline can be reached by dialing 1-800-423-1DOE, or on the internet at www.afdc.nrel.gov.

${ }^{\text {a }}$ These figures represent the lower boundary for the number of LPG vehicles.

In 1993 the Federal Fleet had 8,790 alternative fuel vehicles (AFV). Estimated acquisitions for 1995 indicate that the number of AFVs would more than double. The plans called for the purchase of mostly methanol and compressed natural gas vehicles in 1995.

Although the Energy Policy Act of 1992 (EPACT) set alternative fuel vehicle purchase requirements for Federal and State Governments, fuel providers and the private sector, the Federal fleet requirements have since been increased by Executive Order 12844. A comparison of the two requirements is shown in the graph below.

Table 5.3

Figure 5.1. Federal Fleet Alternative Fuel Vehicle Purchase Requirements ${ }^{2}$

[^29]The propane provider fleet data were collected on the Propane Provider Fleet Survey (EIA-885), a national-level survey of propan e providers. The survey collected information concerning the fleets and fleet vehicles operated by propane providers in the U.S. as of the end of 1993. The information collected included vehicle stock, vehicle acquisition plans, and fleet vehicle operating characteristics.

"Section 501 of the Energy Policy Act mandates that certain percentages of new light-dut y vehicles acquired by alternative fu el providers be alternative fuel vehicles (AFV). The first step in estimating the effects of these mandates entails identifying affected fleets that are covered by the Act. This assessment concludes that a limited number of companies in the methanol, ethanol, propane, and hydrogen industries are likely to be covered by this mandate. On the other hand, many of the large crude oil producers, petroleum refiners, natural gas producers an $d$ transporters, and natural gas and electric utilities are likely to be subject to this mandate."

Table 5.8
Summary of EPACT Section 501 Coverage by Industry, 1994

|  | Percentage of <br> companies likely to <br> be "covered" | Estimated number of <br> light-duty vehicles <br> "covered" | Current AFV percentage of <br> total "covered" <br> light-duty vehicles |
| :--- | :---: | :---: | :---: |
| Methanol | $10 \%$ | 60 | $0 \%$ |
| Ethanol | $0 \%$ | 0 | $0 \%$ |
| Natural gas | $23 \%$ | $73,000^{\text {a }}$ | $20 \%$ |
| Propane $^{\text {b }}$ | $8 \%$ | 420 | $78 \%$ |

## U.S. ADVANCED BATTERY CONSORTIUM

Electric vehicles are the subject of intense research and development because they are required to be sold in California ( $10 \%$ in 2003) under the California Low-Emission Vehicle (LEV) program. Other states have indicated that they will also enforce the LEV program. One of the greatest advantages in using electric vehicles is that there are no vehicle emissions. The U.S. Advanced Battery Consortium (USABC) was established in January 1991 to concentrate efforts on battery development for future electric vehicles. The USABC consists of the Big Three U.S. auto manufacturers (Chrysler, Ford, General Motors), the Electric Power Research Institute, and the U.S. Department of Energy. Five major U.S. electric utilities are also direct participants in USABC.

The USABC has established research contracts with several companies for the development of advanced batteries. Also, a series of Cooperative Research and Development Agreements (CRADAs) with several DOE National Laboratories have been established.

Table 5.9
U.S. Advanced Battery Consortium Research Agreements

| Battery type | Organization |
| :--- | :---: |
|  | Research contracts |
| Nickel-metal hydride | Ovonic Battery Corporation, Troy, MI |
| Sodium-sulfur | Silent Power, Salt Lake City, UT |

Today's lead acid batteries provide 30-40 watt hours per kilogram, cost betwen \$50-150 per kilowatt hour and have a two- to three-year lifetime. However, current batteries do not have energy o $r$ performance sufficient to provide vehicles wh ich are competitive with gasoline-fueled vehicles. When attained, the mid-term Advanced Battery Technology goals will effectively double the range an $d$ performance of electric vehicles compared to the range and performance possible with today' $s$ battery technology.

Table 5.10
Advanced Battery Technology Goals of the U.S. Advanced Battery Consortium

|  | Mid-term goal (1995-1998) | Long-term goal ${ }^{\text {a }}$ |
| :---: | :---: | :---: |
| Power density W/L | 250 | 600 |

${ }^{a}$ The data reflect gallons of gasohol reported by the distributors in each of the selected states. Blanks indicate data were not reported for the state that year.

The prices of $C N G$ and unleaded gasoline vary from place to place. A comparison of fuel prices $b y$ "Natural Gas Fuels" in January 1996 showed in mo st areas CNG is less expensive than unleaded gasoline, as much as $47 \%$ less in Billings, MT. The only surveyed location which sold CNG at a higher price than gasoline was Atlanta, GA.

All else: J. E. Sinor Consultants, Inc., "The Clean Fuels Report," November 1995, pp. 41, 42.

[^33]As of July 1995, only five states offered tax exemptions to encourage the use of gasohol for transportation purposes. This list is quite short compared to the 30 states which offered gasohol tax exemptions ten years ago. Still, the Federal Government encourages gasohol use via a difference in the Federal tax rates of gasoline and gasohol (see Table 5.17).

Note: There is a $\$ 0.10 /$ gallon tax credit for ethanol producers with a total capacity of no more than 30 million gallons/year.

## CHAPTER 6

## NONHIGHWAY MODES

This chapter presents statistics for three major nonhighway transportation modes: air, water, and rail. The combined energy use for these three modes accounted for $17 \%$ of the total energy use in the transportation sector in 1994 (Table 6.1). Air transportation accounted for the largest share (8.7\%) of nonhighway transportation energy consumption.

Air transportation activities can be categorized into two types: air carrier and general aviation. General aviation aircraft serve a variety of purposes, such as business travel and flight instruction, and include all aircraft which do not belong to the air carrier fleet. Since most of the aircraft in this category are used for personal activities, they do not provide commercial passenger or freight services. Although general aviation aircraft account for the majority of the number of aircraft in operation and fly almost five times as many hours as their counterparts in the air carrier category, the lower speeds and the smaller loads of general aviation aircraft result in a significantly smaller share of total aircraft energy use than that of the air carrier fleet.

Domestic marine traffic includes all movements between points in the United States, Puerto Rico, and the Virgin Islands. All movements between the United States and foreign countries are classified as foreign traffic. Foreign trade has been growing faster than domestic. In 1994 foreign trade accounted for just over $50 \%$ of the total waterborne trade, while in 1970 it accounted for only $38 \%$.

Twelve railroad systems in 1994 were designated by the Interstate Commerce Commission (ICC) as Class I freight railroads (Table 6.8). This designation was assigned on the basis of the annual gross revenue of the railroad. A railroad whose revenues were 255.9 million dollars or more in 1993 was designated as a Class I railroad in 1994. The Class I designation is dropped if the railroad fails to meet the annual earnings threshold for three consecutive years. Data for the National Railroad Passenger Corporation (Amtrak) and transit rail are also presented in this chapter.

Orleans, LA, 1996, Table 1-4, pp. 1-6,1-7, and annual.
Energy Use - See Appendix A for Table 2.7.

[^37]Fifty-nine percent of all domestic marine cargo in 1993 were energy-related products (petroleum, coal, coke). The majority of the energy-related products were
shipped internal and local ( $62 \%$ ). Barge traffic accounted for $95 \%$ of all internal and local waterborne commerce.

The number of trailers and containers moved by railroads has increased nearly four-fold from 1965 to 1994. Since 1988, the growth in containers moved by the railroad has increased by an average of $11.2 \%$ per year.

## CHAPTER 7 EMISSIONS AND TRANSPORTATION

The combustion of fossil fuels in transportation vehicles contributes significantly to air pollution. In 1994 the transportation sector was responsible for $78 \%$ of carbon monoxide (CO) emissions and over $32 \%$ of nitrogen oxide $\left(\mathrm{NO}_{\mathrm{x}}\right)$, lead, and volatile organic compound (VOC) emissions (Table 7.1). Highway vehicles, which are responsible for the majority of transportation CO emissions, have reduced their emissions by $31 \%$ from 1970 to 1994 (Table 7.2) despite a $113 \%$ increase in vehicle travel during that time period. Some of the emission reduction can be attributed to the Federal Motor Vehicle Control Program. This program has resulted in the widespread use of catalytic converters on automobiles to reduce not only CO emissions but also $\mathrm{NO}_{\mathrm{x}}$ and VOC emissions.

Transportation and stationary fuel combustion account for the majority of $\mathrm{NO}_{\mathrm{x}}$ emissions (Table 7.3). Light-duty gasoline-powered vehicles and heavy-duty diesel-powered vehicles were responsible for over three-fourths of the transportation sector's $\mathrm{NO}_{\mathrm{x}}$ emissions in 1994 (Table 7.4). Transportation does not play a major role in the emissions of particulate matter (Table 7.6) or sulfur dioxide.

National lead emissions have declined by $98 \%$ from 1970 to 1994 , mostly due to the $99 \%$ decline in transportation lead emissions (Table 7.7). This is mainly due to the fact that almost all highway vehicles are now made to use unleaded gasoline (another result of the Federal Motor Vehicle Control Program).

The estimated U.S. emissions of greenhouse gases in 1993 are presented in Table 7.8. Greenhouse gases block the outward flow of radiation more effectively than they block incoming solar radiation, causing the earth to be warmer than it would be otherwise. More than half of the carbon dioxide $\left(\mathrm{CO}_{2}\right)$ emitted from transportation sources in the U.S. comes from motor gasoline (Table 7.10).

In order to reduce the amount of emissions from mobile sources, the government has imposed standards for hydrocarbons, carbon monoxide, nitrogen oxide and particulate emissions. The Clean Air Act Amendments of 1990 set stricter standards nationwide beginning in 1994 (Tables 7.11-7.13). A discussion of the Clean Cities program concludes this chapter.

U.S. Department of Energy, Energy Information Administration, Emissions of Greenhouse Gases in the United States, 1987-1994, Washington, DC, October 1995, p. 92.

The Clean Air Act of 1963 and its subsequent amendments set national air quality standards for all new cars and light trucks sold. The most recent amendments in 1990 established more restrictive emission control standards which became effective in 1994.

## Source:

California Air Resources Board, Mobile Sources Division, El Monte, CA, 1990.

[^45]${ }^{\mathrm{b}}$ According to recently revised regulations, the marketplace is to determine the amount of ZEVs that are offered for sale.
${ }^{\mathrm{c}}$ Fleet average of non-methane organic gases $=0.062$ in 2003.

Four fuels are projected as capable of meeting the requirements for the transitional low-emission vehicles, lowemission vehicles, ultra-low-emission vehicles, and zero-emission vehicles. Gasoline, alcohol, compressed natural gas, and liquified petroleum gas, with fuel and vehicle improvements, are projected as capable of meeting the first three levels. Electric vehicles are phased in as ultra-low-emission vehicles and are the only vehicle type expected to be zero-emission vehicles.

Table 7.16
Possible Fuel/Vehicles for Clean-Fuel Vehicles

## TRANSITIONAL LOW-EMISSION VEHICLES (TLEVs)

- Gasoline - small/medium displacement engines, heated fuel preparation system, close-coupled catalyst
- Alcohol - improved close-coupled catalyst
- Compressed natural gas - underfloor catalyst
- Liquified petroleum gas - close-coupled catalyst

## LOW-EMISSION VEHICLES (LEVs)

- Gasoline - electrically heated catalyst, phase 2 gasoline
- Alcohol - heated fuel preparation system, close-coupled catalyst
- Compressed natural gas - electronic fuel injection, close-coupled catalyst
- Liquified petroleum gas - electronic fuel injection, close-coupled catalyst

## ULTRA-LOW-EMISSION VEHICLES (ULEVs)

- Gasoline - heated fuel preparation system, electrically heated catalyst, phase 2 gasoline
- Alcohol - heated fuel preparation system, electrically heated catalyst
- Compressed natural gas - electronic fuel injection, electrically heated catalyst
- Electricity - range-extended hybrid vehicles, battery powered vehicles with auxiliary combustion heaters

## HYBRID-ELECTRIC VEHICLES (HEVs)

- Use an electric drive system at least part of the time

## EQUIVALENT ZERO-EMISSION VEHICLES (EZEVs)

- Vehicles having exhaust, evaporative and refueling emissions equivalent to the power plant emissions associated with electric vehicles

## ZERO-EMISSION VEHICLES (ZEVs)

- Electricity - battery-powered vehicles

Additional data from the California Air Resources Board web site (http://arbis.arb.ca.gov/).

Clean Cities is a locally-based government/industry partnership, coordinated by the U.S. Department of Energy to expand the use of alternatives to gasoline and diesel fuel. By combining the decision-making with voluntary action by partners, the "grassroots" approach of Clean Cities departs from traditional "top-down" federal programs. It creates an effective plan, carried out at the local level, for creating a sustainable, nationwide alternative fuels market.

## APPENDIX A

## SOURCES

This appendix contains documentation of the estimationprocedures used by ORNL. The reader can examine the methodology behind the estimates and form an opinion as to their utility.

The appendix is arranged by table number and subject heading. Only tables which contain ORNL estimations are documented in Appendix A; all other tables have sources listed at the bottom of the table. Since abbreviations are used throughout the appendix, a list of abbreviations is also included.

## List of Abbreviations Used in Appendix A

| AAMA | American Automobile Manufacturers Association |
| :--- | :--- |
| AAR | Association of American Railroads |
| APTA | American Public Transit Association |
| Amtrak | National Railroad Passenger Corporation |
| Btu | British thermal unit |
| DOC | Department of Commerce |
| DOE | Department of Energy |
| DOT | Department of Transportation |
| EIA | Energy Information Administration |
| EPA | Environmental Protection Agency |
| FAA | Federal Aviation Administration |
| FHWA | Federal Highway Administration |
| gvw | gross vehicle weight |
| lpg | liquefied petroleum gas |
| MIC | Motorcycle Industry Council |
| mpg | miles per gallon |
| NHTSA | National Highway Traffic Safety Administration |
| NPTS | Nationwide Personal Transportation Study |
| ORNL | Oak Ridge National Laboratory |
| pmt | passenger-miles traveled |
| RECS | Residential Energy Consumption Survey |
| RTECS | Residential Transportation Energy Consumption Survey |
| TIUS | Truck Inventory and Use Survey |
| TSC | Transportation Systems Center |
| vmt | vehicle-miles traveled |

Table 2.10

## Domestic Consumption of Transportation Energy by Mode and Fuel Type, 1994

Most of the source data were given in gallons. It was converted to Btu by using the conversion factors in Appendix B.

## Highway

## Automobiles

Total gallons of fuel taken from DOT, FHWA, Highway Statistics 1994, Table VM-1. These were distributed as follows: $97.8 \%$ gasoline, $1.0 \%$ gasohol, and $1.2 \%$ diesel. Percentages were derived from the DOE, EIA, Office of Markets and End Use, Energy End Use Division, Household Vehicles Energy Consumption 1991, December 1993, p. 46. Methanol use was estimated per personal communication with the California Energy Commission. Natural gas comes from the Natural Gas Annual, Table 1; transit bus and truck natural gas were subtracted from total and the remainder was assumed to be automobile use.

## Motorcycles

DOT, FHWA, Highway Statistics 1994, Table VM-1. For conversion purposes, fuel for all motorcycles was assumed to be gasoline.

## Buses

## Transit:

APTA, 1994-95 Transit Fact Book, February 1995, Washington, DC, pp. 132-135. Non-diesel fossil fuel consumption was assumed to be used by motor buses.

## Intercity:

Eno Transportation Foundation, Transportation in America, Thirteenth Edition, 1996, Washington, DC, p. 56. Data for 1994 are not yet available. For conversion purposes, fuel for all intercity buses was assumed to be diesel fuel.

## School:

Gasoline and Diesel - Eno Transportation Foundation, Transportation in America, Thirteenth Edition, 1996, Washington, DC, p. 56. Data for 1994 are not yet available. For conversion purposes, fuel for school buses was assumed to be half diesel fuel and half gasoline.
Methanol - Methanol use was estimated per personal communication with the California Energy Commission.

## Trucks

## Total:

Sum of light trucks and other trucks.

## Light Trucks:

DOT, FHWA, Highway Statistics 1994, Table VM-1, for single-unit, 2-axle, 4-tire trucks. $96.2 \%$ of fuel assumed to be gasoline, $3.3 \%$ diesel, $0.3 \% \mathrm{lpg}$, and $0.2 \% \mathrm{cng}$; percentages were generated from the 1992 TIUS Public Use Tape.

## Other Trucks:

DOT, FHWA, Highway Statistics 1994, Table VM-1. Total gallons for other trucks was the difference between total and 2-axle, 4 -tire trucks. These gallons were distributed as follows based on data from the 1992 TIUS Public Use Tape: $16.2 \%$ of fuel assumed to be gasoline, $83.3 \%$ diesel, and $0.5 \% \mathrm{lpg}$.

## Off Highway

## Diesel:

Data supplied by Marianne Mintz, Argonne National Laboratory, from the Public Use Data Base, National Energy Accounts, DOC, OBA-NEA-10, August 1988.

## Gasoline:

DOT, FHWA, Highway Statistics 1994, Table MF-24. Agriculture and Construction totals.

## Non-Highway

## Air

## General Aviation:

DOT, FAA, General Aviation Activity and Avionics Survey: Annual Summary Report
Calendar Year 1994, Table 5.1. Jet fuel was converted from gallons to Btu using 135,000 Btu/gallon (kerosene-type jet fuel).

## Domestic and International Air Carrier:

DOT, Bureau of Transportation Statistics, "Fuel Cost and Consumption Tables;" annual figures were obtained by summing monthly totals. Because the data for internationa included fuel purchased abroad, the international total was divided in half to estimate domestic fuel use for international flights.

## Water

Freight:
Total - DOE, EIA, Fuel Oil and Kerosene Sales, 1994, Table 23. Adjusted sales of distillate and residual fuel oil for vessel bunkering.

## Recreational Boating:

Fuel use by recreational boating was calculated using the methodology developed by D. L. Greene in the report, Off-Highway Use of Gasoline in the United States (DOT, FHWA, July 1986, p. 3-22). Results from Model 1 in the report indicated an average annual consumption of 205 gallons per boat. Total consumption in gallons was then calculated using the following equation: Total $=0.95$ (Gal/boat) (number of boats). An estimate of number of recreational boats in operation was found in Boating Industry Magazine, Annual Report, "The Boating Business 1994" (Communication Channels, Inc., Chicago, IL). The total was the sum of inboard, outboard and inboard/outdrive boats.

## Pipeline

The sum of natural gas, crude petroleum and petroleum product, and coal slurry and water.

## Natural Gas:

The amount of natural gas used to transport natural gas was defined as "pipeline fuel" as reported in DOE, EIA, Natural Gas Annual 1994, Table 1. Cubic feet were converted to Btu using $1,031 \mathrm{Btu} / \mathrm{ft}^{3}$. Electricity use was estimated using the following procedure as reported on p. 5-110 of J. N. Hooker et al., End Use Energy Consumption DataBase: Transportation Sector. The energy consumption of a natural gas pipeline was taken to be the energy content of the fuel used to drive the pumps. Some $94 \%$ of the installed pumping horsepower was supplied by natural gas. The remaining $6 \%$ of the horse power was generated more efficiently, mostly by electric motors. The energy consumed by natural gas pipeline pumps that were electrically powered was not known. In order to estimate the electricity consumed, the Btu of natural gas pipeline fuel consumed was multiplied by a factor of 0.015 . From this computed value, electricity efficiency and generation loss must be taken into account. The electricity energy use in Btu must be converted to kWhr , using the conversion factor $29.305 \times 10^{-5} \mathrm{kWhr} /$ Btu. Electricity generation and distribution efficiency was $29 \%$. When generation and distribution efficiency are taken into account, 1 kWhr equals $11,765 \mathrm{Btu}$.

Crude petroleum and petroleum product:
J. N. Hooker, Oil Pipeline Energy Consumption and Efficiency, ORNL-5697, ORNL, Oak Ridge, TN, 1981. (Latest available data.)

## Coal slurry and water:

W. F. Banks, Systems, Science and Software, Energy Consumption in the Pipeline Industry, LaJolla, CA, October 1977. (Latest available data.)

## Rail

## Total:

Sum of freight and passenger rail.

## Freight:

AAR, Railroad Facts, 1995 Edition, Washington, DC, p. 60.

## Passenger:

Transit and Commuter - APTA, 1994-95 Transit Fact Book, February 1995, Washington, DC, p. 132-135. Transit was defined as the sum of "heavy rail," "light rail," ard "other."
Intercity - Personal communication with Amtrak, Washington, DC.

Table 2.12
Transportation Energy Consumption by Mode, 1970-94

## Highway

## Automobiles

Total gallons of fuel for automobiles was takenfrom DOT, FHWA, Highway Statistics Summary to 1985, Table VM-201A; and Table VM-1 in the 1986-94 annual editions. Fuel for automobiles was distributed between fuel types for conversion into Btu's as follows:

1970-80-94.7\% gasoline, $5.3 \%$ diesel as reported in the DOE, EIA, Office of Energy Markets and End Use, Residential Energy Consumption Survey: Consumption Patterns of Household Vehicles, June 1979 to December 1980, p. 10.
1981-82-94.1\% gasoline, $5.9 \%$ diesel as reported in the DOE, EIA, Office of Energy Markets and End Use, Residential Energy Consumption Survey: Consumption Patterns of Household Vehicles, Supplement: January 1981 to September 1981, pp. 11, 13.
1983-84-97.5\% gasoline, $2.5 \%$ diesel as reported in the DOE, EIA, Office of Markets and End Use, Energy End Use Division, Residential Transportation Energy Consumption Survey: Consumption Patterns of Household Vehicles, 1983, Jan., 1985, pp. 7, 9.
1985-87-98.5\% gasoline, $1.5 \%$ diesel as reported in the DOE, EIA, Office of Energy Markets and End Use, Residential Transportation Energy Consumption Survey. Consumption Patterns of Household Vehicles 1985, April 1987, pp. 25, 27.
1988-90-98.8\% gasoline and 1.2\% diesel as reported in the DOE, EIA, Office of Markets and End Use, Energy End Use Division, Household Vehicles Energy Consumption 1988, March 1990, p. 65.
1991-93-97.8\% gasoline, $1.0 \%$ gasohol, and $1.2 \%$ diesel as reported in the DOE, EIA, Office of Markets and End Use, Energy End Use Division, Household Vehicles Energy Consumption 1991, December 1993, p. 46.
1993-94-Methanol use was estimated per personal communication with the California Energy Commission.

## Motorcycles

Department of Transportation, Federal Highway Administration, Highway Statistics Summary to 1985, Table VM-201A; and Table VM-1 in the 1986-94 annual editions. For conversion purposes, fuel for all motorcycles was assumed to be gasoline.

## Buses

Sum of transit, intercity and school.

## Transit:

APTA, 1994-95 Transit Fact Book, February 1995, Washington, DC, pp. 132-135, and annual.
Non-diesel fossil fuel consumption was assumed to be used by motor buses. For the years 1988-92, motor bus gasoline use was estimated as $5 \%$ of "other" fuels, based on personal communication with the APTA Research and Statistics Department.

## Intercity:

1970-84 - American Bus Association, Annual Report, Washington, DC, annual.
1985-93 - Eno Transportation Foundation, Transportation in America, Thirteenth Edition, 1995, Washington, DC, p. 56. Data for 1994 are not yet available. For conversion purposes, fuel for all intercity buses was assumed to be diesel fuel.

## School:

1970-84 - DOT, FHWA, Highway Statistics 1984, Washington, DC, Table VM-1, and annual.
1985-86 - DOT, Research and Special Programs Administration, National Transportation Statistics, Figure 2, p. 5, and annual.
1987-93 - Eno Transportation Foundation, Transportation in America, Twelfth Edition, 1995, Washington, DC, p. 56. Data for 1994 are not yet available. For conversion purposes, fuel for school buses was assumed to be half diesel fuel and half gasoline.

## Trucks

## Light Trucks:

Defined as 2-axle, 4-tire trucks. Total gallons of fuel was taken from DOT, FHWA Highway Statistics Summary to 1985, Table VM-201A, and Table VM-1 of the 198694 annual editions. Based on data from the 1982 TIUS Public Use Tape, fuel use for 1970-1987 was distributed among fuel types as follows: $95.3 \%$ gasoline; $3.5 \%$ diesel; and $1.2 \%$ lpg. Fuel use for $1988-1993$ was distributed based on the 1987 TIUS: $96.6 \%$ gasoline; $3.3 \%$ diesel; and $0.1 \%$ lpg. Fuel use for 1994 was distributed based on the 1992 TIUS: $96.2 \%$ gasoline; $3.3 \%$ diesel; $0.3 \% \mathrm{lpg}$; and $0.2 \%$ cng.

## Other Trucks:

Defined as the difference between total trucks and 2-axle, 4 -tire trucks. Total gallons of fuel was taken from DOT, FHWA, Highway Statistics Summary to 1985, Table VM-201A, and Table VM-1 of the 1986-94 annual editions. Based on data from the 1982 TIUS Public Use Tape, fuel use for 1970-1987 was distributed among fuel types as follows: $39.6 \%$ gasoline; $59.4 \%$ diesel; and $1.0 \% \mathrm{lpg}$. Fuel use for $1988-93$ was distributed based on the 1987 TIUS: $19.4 \%$ gasoline; $80.4 \%$ diesel; and $0.2 \% \mathrm{lpg}$. Fuel use for 1994 was distributed based on the 1992 TIUS: $16.2 \%$ gasoline; $83.3 \%$ diesel; and $0.5 \% \mathrm{lpg}$.

## Total Highway

Sum of autos, motorcycles, buses, light trucks, and other trucks.

## Non-Highway

## Air

Sum of fuel use by General Aviation and Certificated Route Air Carrier.

## General Aviation:

1970-74-DOT, TSC, National Transportation Statistics, Cambridge, MA, 1981. 1975-85-DOT, FAA, FAA Aviation Forecasts, Washington, DC, annual. 1985-94 - DOT, FAA, General Aviation Activity and Avionics Survey: Annual Summary

Report, Calendar Year 1994, Table 5.1. Jet fuel was converted from gallons to Btu using 135,000 Btu/gallon (kerosene-type jet fuel).

## Certificated Route Air Carrier:

1970-81 - DOT, Civil Aeronautics Board, Fuel Cost and Consumption, Washington, DC, annual.
1982-94 - DOT, Bureau of Transportation Statistics, "Fuel Cost and Consumption Tables;" annual figures were obtained by summing monthly totals. Because the data for international included fuel purchased abroad, the international total was divided in half to estimate domestic fuel use for international flights.

## Water

Sum of vessel bunkering fuel (i.e., freight) and fuel used by recreational boats.

## Freight:

Total - DOE, EIA, Fuel Oil and Kerosene Sales, 1994, Table 23. Adjusted sales of distillate and residual fuel oil for vessel bunkering.

## Recreational Boating:

1970-84 - DOT, FHWA, Highway Statistics, Washington, DC, Table MF-24, annual.
1985-94 - Fuel use by recreational boating was calculated using the methodology developed by D. L. Greene in the report, Off-Highway Use of Gasoline in the United States (DOT, FHWA, July 1986, p. 3-22). Results from Model 1 in the report indicated an average annual consumption of 205 gallons per boat. Total consumption in gallons was then calculated using the following equation: Total $=0.95$ (Gal/boat) (number of boats). An estimate of number of recreational boats in operation was found in Boating Industry Magazine, Annual Report, "The Boating Business 1994" (Communication Channels, Inc., Chicago, IL) and annual. The total was the sum of inboard, outboard and inboard/outdrive boats.

## Pipeline

The sum of natural gas, crude petroleum and petroleum product, and coal slurry and water.

## Natural Gas:

The amount of natural gas used to transport natural gas was defined as "pipeline fuel" $\mathbf{\infty}$ reported in DOE, EIA, Natural Gas Annual 1994, Table 1. Cubic feet were converted to Btu using $1,031 \mathrm{Btu} / \mathrm{ft}^{3}$. Electricity use was estimated using the following procedure as reported on p. 5-110 of J. N. Hooker et al., End Use Energy Consumption DataBase: Transportation Sector. The energy consumption of a natural gas pipeline was taken to be the energy content of the fuel used to drive the pumps. Some $94 \%$ of the installed pumping horsepower was supplied by natural gas. The remaining $6 \%$ of the horse power was generated more efficiently, mostly by electric motors. The energy consumed by natural gas pipeline pumps that were electrically powered was not known. In order to estimate the electricity consumed, the Btu of natural gas pipeline fuel consumed was multiplied by a factor of 0.015 . From this computed value, electricity efficiency and generation loss must be taken into account. The electricity energy use in Btu must be converted to kWhr , using the conversion factor $29.305 \times 10^{-5} \mathrm{kWhr} / \mathrm{Btu}$. Electricity generation and distribution efficiency was $29 \%$. When generation and distribution efficiency are taken into account, 1 kWhr equals $11,765 \mathrm{Btu}$.

## Crude petroleum and petroleum product:

J. N. Hooker, Oil Pipeline Energy Consumption and Efficiency, ORNL-5697, ORNL, Oak Ridge, Tennessee, 1981. (Latest available data.)

## Coal slurry and water:

W. F. Banks, Systems, Science and Software, Energy Consumption in the Pipeline Industry, LaJolla, California, October 1977. (Latest available data.)

## Rail

## Total:

Sum of freight and passenger rail.

## Freight:

AAR, Railroad Facts, 1995 Edition, Washington, DC, p. 60.

## Passenger:

Transit and Commuter - APTA, 1994-95 Transit Fact Book, February 1995, Washington, DC, p. 132-135, annual. Transit was defined as the sum of "heavy rail," "light rail," and "other."
Intercity - Personal communication with Amtrak, Washington, DC.

Table 2.14
Passenger Travel and Energy Use in the United States, 1994

## Highway

## Automobiles

Number of Vehicles - DOT, FHWA, Highway Statistics 1994, Table VM-1.
Vmt - DOT, FHWA, Highway Statistics 1994, Table VM-1.
Pmt - Calculated by ORNL (load factor times vmt).
Load Factor - DOT, FHWA, Office of Highway Information Mangement, 1990 NPTS, Public Use Tape, 1992.
Energy Use - Total gallons of fuel taken from DOT, FHWA, Highway Statistics 1994, Table VM1. These were distributed as follows: $97.8 \%$ gasoline, $1.0 \%$ gasohol, and $1.2 \%$ diesel. Percentages were derived from the DOE, EIA, Office of Markets and End Use, Energy End Use Division, Household Vehicles Energy Consumption 1991, December 1993, p. 46. Methanol use was estimated per personal communication with the California Energy Commission.

## Personal Trucks

Number of Vehicles - Based on the 1992 TIUS, $73.9 \%$ of total 2-axle, 4-tire trucks and $15.5 \%$ of total other trucks were for personal use. Therefore, $73.9 \%$ of total 2-axle, 4-tire trucks (as reported by DOT, FHWA in Highway Statistics 1993, Table VM-1) and $15.5 \%$ of total other trucks were estimated to be for personal use.
$V m t-68.8 \%$ of total vehicle miles traveled by 2-axle, 4-tire trucks (as reported by DOT, FHWA in Highway Statistics 1994, Table VM-1) and $7.1 \%$ of total vehicle miles traveled by other trucks were for personal use. The percentages were derived by ORNL from the 1992 TIUS Micro Data File on CD.
Pmt - Calculated by ORNL as vmt multiplied by load factor.
Load Factor - DOT, FHWA, Office of Highway Information Management, 1990 NPTS, Public Use Tape, 1992.
Energy Use- Assuming that there is no difference in fuel economy (measured in miles per gallon) between personal-use trucks and non-personal use trucks, $66.0 \%$ of total fuel consumption by 2-axle, 4-tire trucks (as reported by DOT, FHWA in Highway Statistics 1994, Table VM1) and $3.5 \%$ of total other truck fuel consumption was for personal use. These percentages were derived by ORNL from the 1992 TIUS Public Use tape. Total truck energy use was the sum of light truck and other truck energy use.
Light Trucks: DOT, FHWA, Highway Statistics 1994, Table VM-1, for single-unit, 2-axle, 4-tire trucks. $96.2 \%$ of fuel assumed to be gasoline, $3.3 \%$ diesel, $0.3 \% \mathrm{lpg}$, and $0.2 \%$ cng; percentages were generated from the 1992 TIUS Micro Data File on CD.

Other Trucks: DOT, FHWA, Highway Statistics 1994, Table VM-1. Total gallons for other trucks was the difference between total and 2 -axle, 4 -tire trucks. These values were distributed based on data from the 1992 TIUS Public Use Tape: $16.2 \%$ of fuel assumed to be gasoline, $83.3 \%$ diesel, and $0.5 \%$ lpg.

## Motorcycles

Number of Vehicles and Vmt - DOT, FHWA, Highway Statistics 1994, Table VM-1.
Pmt-Calculated by ORNL as vmt multiplied by load factor.
Load Factor - DOT, FHWA, Office of Highway Information Management, 1990 NPTS, Public Use Tape, 1992.
Energy Use - DOT, FHWA, Highway Statistics 1994, Table VM-1. For conversion purposes, fuel for all motorcycles was assumed to be gasoline.

## Buses

## Transit:

Number of Vehicles, Vmt, Pmt, and Energy Use - Motor bus only. APTA, 1994-95 Transit Fact Book, February 1995, Washington, DC, pp. 106, 107, 110, 132-135.
Load Factor - Calculated by ORNL as pmt/vmt.

## Intercity:

Number of Vehicles - Estimated by ORNL as $18 \%$ of commercial bus registrations, DOT, FHWA, Highway Statistics 1994, Table MV-10.
Pmt - Eno Transportation Foundation, Transportation in America, Thirteenth Edition, Washington, DC, 1995, p. 47.
$V m t$ - Estimated using passenger travel and an average load factor of 23.2 persons/vehicle. Load Factor -Estimated as 23.2 based on historical data.
Energy Use - Eno Transportation Foundation, Transportation in America, Thirteenth Edition, 1995, Washington, DC, p. 56. For conversion purposes, fuel for all intercity buses was assumed to be diesel fuel.

## School:

Number of Vehicles - School and other nonrevenue as reported in DOT, FHWA, Highway Statistics 1994, Table MV-10.
Vmt, Pmt - National Safety Council, Accident Facts, 1995 Edition, Chicago, IL, pp. 70-71.
Load Factor - Calculated by ORNL as pmt/vmt.
Energy Use - Eno Transportation Foundation, Transportation in America, Thirteenth Edition, 1995, Washington, DC, p. 56. For conversion purposes, fuel for school buses was assumed to be half diesel fuel and half gasoline.

## Non-Highway

## Air

## Large Certified Route Air Carriers:

Vmt - Revenue aircraft miles flown, DOT, FAA, FAA Statistical Handbook of Aviation Calendar Year 1993, p. 6-4. (1994 - personal communication.)
Pmt-Revenue pmt of domestic operations, scheduled and nonscheduled, DOT, FAA, FAA Statistical Handbook of Aviation Calendar Year 1993, p. 6-4. (1994-personal communication.)
Load Factor - Calculated by ORNL as pmt/vmt.
Energy Use - DOT, Bureau of Transportation Statistics, "Fuel Cost and Consumption Tables;" annual figures were obtained by summing monthly totals. Because the data for international included fuel purchased abroad, the international total was divided by two to estimate domestic fuel use for international flights.

## General Aviation:

Number of Vehicles, Vmt, Energy Use - DOT, FAA, General Aviation Activity and Avionics, Survey: Calendar Year 1994, pp. 1-7, 3-11, 5-3.
Pmt - Eno Transportation Foundation, Transportation in America, Thirteenth Edition, Washington, DC, 1994, p. 47.
Load Factor - Calculated by ORNL as pmt/vmt.

## Recreational Boating

Number of Vehicles - Whitney Communications, Boating Industry Magazine, Annual Report, "The Boating Business 1994." The total wa the sum of inboard, outboard, and inboard/outdrive boats.
Energy Use - Fuel use by recreational boating was calculated using the methodology developed by D. L. Greene in the report, Off-Highway Use of Gasoline in the United States (DOT, FHWA, July 1986, p. 3-22). Results from Model 1 in the report indicated an average annual consumption of 205 gallons per boat. Total consumption in gallons was then calculated using the following equation: Total $=0.95$ ( $\mathrm{Gal} / \mathrm{boat}$ ) (number of boats). An estimate of number of recreational boats in operation was found in Boating Industry Magazine, Annual Report, "The Boating Business 1994" (Communication Channels, Inc., Chicago, IL). The total was the sum of inboard, outboard and inboard/outdrive boats.

## Rail

## Intercity:

Number of Vehicles, Vmt and Pmt-AAR, Railroad Facts, 1995 Edition, Washington, DC, p. 78.

Load Factor - Calculated by ORNL as pmt/vmt.
Energy Use - Personal communication with Amtrak, Washington, DC.

## Transit and Commuter:

Number of Vehicles, Vmt and Pmt - APTA, 1994-95 Transit Fact Book, February 1995, Washington, DC, pp. 106, 107, 110.
Load Factor - Calculated by ORNL as pmt/vmt.
Energy Use - APTA, 1994-95 Transit Fact Book, February 1995, Washington, DC, pp. 132-
135. Transit was defined as the sum of "heavy rail," "light rail," and "other."

Table 2.15
Intercity Freight Movement and Energy Use in the United States, 1994

## Highway

## Trucks

Vehicles - $0.3 \%$ of total 2-axle, 4-tire trucks (as reported by DOT, FHWA in Highway Statistics 1994, Table VM-1) and $24 \%$ of total other trucks were engaged in intercity freight movement. These percentages were derived by ORNL from the 1992 TIUS Micro Data File on CD. Intercity freight trucks were defined as any truck whose:

- greatest share of miles were traveled more than 50 miles away from the vehicle's home base; and
- principal use was not personal or passenger transportation; and
- body type was not pickup, minivan, or utility vehicle.
$V m t-0.6 \%$ of total vehicle miles traveled by 2 -axle, 4 -tire trucks (as reported by DOT, FHWA in Highway Statistics 1994, Table VM-1) and $59.5 \%$ of total vehicle miles traveled by other trucks were used in intercity freight movement. These percentages were derived by ORNL from the 1992 TIUS Micro Data File on CD.
Ton Miles, Tons Shipped and Average Length of Haul - Eno Transportation Foundation, Transportation in America, Thirteenth Edition, Washington, DC, 1995, pp. 44, 46, 71.
Energy Intensity - Energy use divided by ton-miles.
Energy Use - $0.9 \%$ of total fuel consumption by 2-axle, 4-tire trucks (as reported by DOT, FHWA in Highway Statistics 1994, Table VM-1) and $67.2 \%$ of total other truck fuel consumption were used in intercity freight movement. These percentages were derived by ORNL from the 1992 TIUS Micro Data File on CD.

## Non-Highway

## Waterborne Commerce

Vehicles - U.S. Department of the Army, Army Corps of Engineers, "Summary of U.S. Flag Passenger and Cargo Vessels, 1992," New Orleans, LA, 1993.
Ton Miles, Tons Shipped, and Average Length of Haul - U.S. Department of the Army, Corps of Engineers, Waterborne Commerce of the United States, Calendar Year 1994, Part 5: National Summaries, New Orleans, LA, 1996, pp. 1-6, 1-7.
Energy Intensity - Energy use divided by ton miles.
Energy Use - DOE, EIA, Fuel Oil and Kerosene Sales, 1994, Table 23. Adjusted sales of distillate and residual fuel oil for vessel bunkering.
Domestic freight energy use was calculated as:
Distillate fuel $-77.5 \%$ domestic
Residual fuel - $9.3 \%$ domestic.
Percentages were derived from the DOC, U.S. Foreign Trade, Bunker Fuels, "Oil and Coal Laden in the U.S. on Vessels Engaged in Foreign Trade," 1988. This report was discontinued in 1989. No other source for these data has been located.

## Pipeline

## Natural Gas:

Tons shipped - DOE, EIA, Natural Gas Annual 1994, Washington, DC, 1995, Table 1. Total natural gas disposition divided by $44,870 \mathrm{ft}^{3} /$ ton.
Energy use - The amount of natural gas used to transport natural gas was defined as "pipeline fuel" as reported in DOE, EIA, Natural Gas Annual 1994, Table 1. Cubic feet were converted to Btu using $1,031 \mathrm{Btu} / \mathrm{ft}^{3}$. Electricity use was estimated using the following procedure as reported on p. 5-110 of J. N. Hooker et al., End Use Energy Consumption DataBase: Transportation Sector. The energy consumption of a natural gas pipeline was taken to be the energy content of the fuel used to drive the pumps. Some $94 \%$ of the installed pumping horsepower was supplied by natural gas. The remaining $6 \%$ of the horse power was generated more efficiently, mostly by electric motors. The energy consumed by natural gas pipeline pumps that were electrically powered was not known. In order to estimate the electricity consumed, the Btu of natural gas pipeline fuel consumed was multiplied by a factor of 0.015 . From this computed value, electricity efficiency and generation loss must be taken into account. The electricity energy use in Btu must be converted to kWhr, using the conversion factor $29.305 \times 10^{-5} \mathrm{kWhr} /$ Btu. Electricity generation and distribution efficiency was $29 \%$. When generation and distribution efficiency are taken into account, 1 kWhr equals 11,765 Btu.

## Crude Oil and Petroleum Product:

Ton Miles and Tons Shipped - Eno Transportation Foundation, Transportation in America, Thirteenth Edition, Washington, DC, 1995, pp. 44, 46.
Energy Use - W. F. Banks, Systems, Science, and Software, Inc., Energy Consumption in the Pipeline Industry, LaJolla, CA, 1977.

## Rail

Vehicles, Vmt, Ton Miles, Average Length of Haul - AAR, Railroad Facts, 1995 Edition, Washington, DC, 1995, pp. 27, 34, 36, 50.
Tons shipped - AAR, Analysis of Class I Railroads 1994, 1995, p. 31.
Energy Use -AAR, Railroad Facts, 1995 Edition, Washington, DC, p. 60.

Table 2.16 Energy Intensities of Passenger Modes, 1970-94

In reference to transportation, the energy intensity of a mode is the ratio of the energy inputs to a process to a measure of the useful outputs from that process; for example, Btu per pmt or Btu per ton-mile. The energy intensity ratios were calculated for each passenger mode using the following data sources:

## Highway

## Automobiles

Vmt DOT, FHWA, Highway Statistics Summary to 1985, Table VM-201A, and Table VM-1 of the 1987-94 editions.
Pmt-vmt multiplied by the load factor.
Energy Use - Total gallons of fuel for automobiles was taken from DOT, FHWA, Highway Statistics Summary to 1985, Table VM-201A; and Table VM-1 in the 1986-94 annual editions. Fuel for automobiles was distributed between fuel types for conversion into Btu's as follows:

1970-80-94.7\% gasoline, $5.3 \%$ diesel as reported in the DOE, EIA, Office of Energy Markets and End Use, Residential Energy Consumption Survey: Consumption Patterns of Household Vehicles, June 1979 to December 1980, p. 10.
1981-82-94.1\% gasoline, $5.9 \%$ diesel as reported in the DOE, EIA, Office of Energy Markets and End Use, Residential Energy Consumption Survey: Consumption Patterns of Household Vehicles, Supplement: January 1981 to September 1981, pp. 11, 13.
1983-84-97.5\% gasoline, 2.5\% diesel as reported in the DOE, EIA, Office of Markets and End Use, Energy End Use Division, Residential Transportation Energy Consumption Survey: Consumption Patterns of Household Vehicles, 1983, Jan., 1985, pp. 7, 9.
1985-87-98.5\% gasoline, $1.5 \%$ diesel as reported in the DOE, EIA, Office of Energy Markets and End Use, Residential Transportation Energy Consumption Survey. Consumption Patterns of Household Vehicles 1985, April 1987, pp. 25, 27.
1988-90-98.8\% gasoline and 1.2\% diesel as reported in the DOE, EIA, Office of Markets and End Use, Energy End Use Division, Household Vehicles Energy Consumption 1988, March 1990, p. 65.
1991-93-97.8\% gasoline, 1.0\% gasohol, and $1.2 \%$ diesel as reported in the DOE, EIA, Office of Markets and End Use, Energy End Use Division, Household Vehicles Energy Consumption 1991, December 1993, p. 46.
1993-94 - Methanol use was estimated per personal communication with the California Energy Commission.

## Buses

## Transit:

Vmt, Pmt, Energy Use - APTA, 1994-95 Transit Fact Book, February 1995, Washington, DC, pp. 106, 107, 132-135, and annual.
Non-diesel fossil fuel consumption was assumed to be used by motor buses. For the years 1988-94, motor bus gasoline use was estimated as $5 \%$ of "other" fuels, based o personal communication with the APTA Research and Statistics Department.

## Intercity:

Pmt - 1970-84 - American Bus Association, Annual Report, Washington, DC, annual.
1985-94 - Eno Transportation Foundation, Transportation in America, Thirteenth Edition, Washington, DC, 1995, p. 47.
Energy Use - 1970-1984 - American Bus Association, Annual Report, Washington, DC, annual.
1985-94 - Eno Transportation Foundation, Transportation in America, Thirteenth Edition, Washington, DC, p. 56, and annual. For conversion purposes, fuel for all intercity buses was assumed to be diesel fuel.

## School:

Vmt - 1970-84 - DOT, FHWA, Highway Statistics 1984, Washington, DC, Table VM-1, p. 175, and annual.
1985-87- DOT, TSC, National Transportation Statistics, 1989, Figure 2, p. 7, and annual.
1988-94 - National Safety Council, Accident Facts, 1995 Edition , Chicago, IL, p. 71, and annual.
Energy Use - 1970-1984 - DOT, FHWA, Highway Statistics 1984, Washington, DC, Table VM-1, and annual.
1985-86 - DOT, TSC, National Transportation Statistics, Figure 2, p. 5, and annual. 1987-94 - Eno Transportation Foundation, Transportation in America, Thirteenth Edition, Washington, DC, p. 56, and annual. For conversion purposes, fuel for school buses was assumed to be half diesel fuel and half gasoline.

## Non-Highway

## Air

## Certificated Air Carriers:

Pmt - DOT, FAA, FAA Statistical Handbook of Aviation, Calendar Year 1993, Washington, DC, 1995, p. 6-4, and annual. (1994-Personal communication.)

Energy Use - 1970-81 - DOT, Civil Aeronautics Board, Fuel Cost and Consumption, Washington, DC, annual.
1982-94 - DOT, Bureau of Transportation Statistics, "Fuel Cost and Consumption Tables;" annual figures were obtained by summing monthly totals. Because the data for international included fuel purchased abroad, the international total was divided in half to estimate domestic fuel use for international flights.

## General Aviation:

Pmt - Eno Transportation Foundation, Transportation In America, Thirteenth Edition, Washington, DC, 1995, p. 47.
Energy Use - 1970-74 - DOT, TSC, National Transportation Statistics, Cambridge, MA, 1981.
1975-85-DOT, FAA, FAA Aviation Forecasts, Washington, DC, annual.
1985-94 - DOT, FAA, General Aviation Activity and Avionics Survey: Calendar Year
1994, Table 5.1. Jet fuel was converted from gallons to Btu using 135,000 Btu/gallon (kerosene-type jet fuel).

## Rail

## Passenger (Amtrak):

Pmt-1971-83-AAR, Statistics of Class I Railroads, Washington, DC, annual.
1984-88 - AAR, Railroad Facts, 1988 Edition, Washington, DC, December 1989, p. 61, and annual.
1989-94 - Personal communication with Amtrak.
Energy Use - Personal communication with Amtrak.

## Transit:

Pmt and Energy Use - APTA, 1994-95 Transit Fact Book, February 1995, Washington, DC, pp. 106, 132-135. Transit was defined as the sum of "heavy rail," "light rail,"and "other."

Table 2.17

## Energy Intensities of Freight Modes, 1970-94

In reference to transportation, the energy intensity of a mode is the ratio of the energy inputs to a process to a measure of the useful outputs from that process; for example, Btu per pmt or Btu per ton-mile. The energy intensity ratios were calculated for each freight mode using the following data sources:

## Highway

## Trucks

Vmt DOT, FHWA, Highway Statistics Summary to 1985, Table VM-201 A, and Table VM-1 of the 1987-94 editions. Light trucks were defined as 2-axle, 4-tire trucks. Other trucks were defined as the difference between total trucks and 2-axle, 4-tire trucks.
Energy Use - Light Trucks - Defined as 2-axle, 4-tire trucks. Total gallons of fuel was taken from DOT, FHWA, Highway Statistics Summary to 1985, Table VM-201A, and Table VM-1 of the 1986-94 annual editions. Based on data from the 1982 TIUS Public Use Tape, fuel use for 1970-1987 was distributed among fuel types as follows: $95.3 \%$ gasoline; $3.5 \%$ diesel; and $1.2 \%$ lpg. Fuel use for 1988-93 was distributed based on the 1987 TIUS: $96.6 \%$ gasoline; $3.3 \%$ diesel; and $0.1 \% \mathrm{lpg}$. Fuel use for 1994 was distributed based on the 1992 TIUS: $96.2 \%$ gasoline; $3.3 \%$ diesel; $0.3 \% \mathrm{lpg}$; and $0.2 \% \mathrm{cng}$.
Other Trucks - Defined as the difference between total trucks and 2-axle, 4-tire trucks. Total gallons of fuel was taken from DOT, FHWA, Highway Statistics Summary to 1985, Table VM-201A, and Table VM-1 of the 1986-94 annual editions. Based on data from the 1982 TIUS Public Use Tape, fuel use for 1970-1987 was distributed among fuel types as follows: $39.6 \%$ gasoline; $59.4 \%$ diesel; and $1.0 \%$ lpg. Fuel use for $1988-93$ was distributed based on the 1987 TIUS: $19.4 \%$ gasoline; $80.4 \%$ diesel; and $0.2 \%$ lpg. Fuel use for 1994 was distributed based on the 1992 TIUS: $16.2 \%$ gasoline; $83.3 \%$ diesel; and $0.5 \% \mathrm{lpg}$.

## Non-Highway

## Water

Ton Miles - U.S. Department of the Army, Corps of Engineers, Waterborne Commerce of the United States, Calendar Year 1994, Part 5: National Summaries, New Orleans, LA, 1996, p. 1-6, and annual.

Energy Use - Calculated as the difference between total water freight energy use and foreign water freight energy use.
Total - DOE, EIA, Fuel Oil and Kerosene Sales, 1994, Table 23. Adjusted sales of distillate and residual fuel oil for vessel bunkering.

## Rail

Freight Car Miles, Ton Miles and Energy Use - AAR, Railroad Facts, 1995 Edition, Washington, DC, 1995, pp. 27, 36, 60, and annual.

Table 3.3

## Vehicle Stock, New Sales and New Registrations in the United States, 1994 Calendar Year

## Highway

## Automobiles

## Vehicle Stock:

The number of vehicles in use by EPA size class were derived as follows: Market Shares by EPA size class for new car sales from 1970-1975 were taken from the DOT, NHTSA, Automotive Characteristics Historical DataBase, Washington, DC. Market shares for the years 1976-1990 were found in Linda S. Williams and Patricia S. Hu, Highway Vehicle MPG and Market Shares Report: Model Year 1990, ORNL-6672, April 1991, and Table 7 and the ORNL MPG and Market Shares Database, thereafter. These data were assumed to represent the number of cars registered in each size class for each year. These percentages were applied to the automobiles in operation for that year as reported by R. L. Polk and Company (FURTHER REPRODUCTION PROHIBITED) and summed to calculate the total mix. This method assumed that all vehicles, large and small, were scrapped at the same rate.

## Sales:

Domestic, import, and total sales were from AAMA, Facts and Figures '95, p. 16. The domestic sales were distributed by size class according to the following percentages: Two seater, $0.4 \%$; Minicompact, $0 \%$; Subcompact, $18.4 \%$; Compact $35.0 \%$; Midsize, $27.4 \%$; and Large, $18.4 \%$. The import sales were distributed by size class according to the following percentages: Two-seater, 2.5\%; Minicompact, 2.4\%; Subcompact, 37.3\%; Compact, 33.8\%; Midsize, $22.6 \%$; and Large, $1.3 \%$. These percentages were derived from the ORNL MPG and Market Shares Database and were based on the sales period instead of the calendar year. Domestic-sponsored imports (captive imports) were included in the import figure only.

## See Glossary for definition of Automobile Size Classifications.

## Motorcycles

Stock -MIC, 1995 Motorcycle Statistical Annual, p. 14, registrations.

Sales - MIC, 1995 Motorcycle Statistical Annual, pp. 10 and 16. Sales included motorcycles, scooters, and all-terrain vehicles for on- and off-highway use.

## Recreational Vehicles

Sales- Ward's Automotive Yearbook, 1995 U.S. Recreation Vehicle Shipments by Type, "Total," p. 92.

Trucks

Stock - Vehicles in use by weight class were determined by applying the percentage in use by weight class as reported in DOC, Bureau of the Census, 1992 TIUS, ( $0-10,000 \mathrm{lbs}, 93.2 \%$; 10,001$19,500 \mathrm{lbs}, 2.1 \% ; 19,501-26,000 \mathrm{lbs}, 1.2 \% ; 26,001 \mathrm{lbs}$ and over, $3.4 \%$ ) to the total number of trucks in use as reported by R. L. Polk and Company (FURTHER REPRODUCTION PROHIBITED).
Sales - AAMA, Facts and Figures '95, p. 21.

Table 3.27
Summary Statistics on Buses by Type, 1970-94

## Number in Operation

## Transit buses :

American Public Transit Association, 1994-95 Transit Fact Book, Washington, DC, February 1995, p. 110, and annual.

## Intercity buses:

1970-80 - American Bus Association, 1984 Annual Report, Washington, DC, and annual. 1985 - U.S. Department of Transportation, Transportation Systems Center, National Transportation Statistics, Cambridge, MA, August 1990, Figure 5, p. 8, and annual. 1990-94 - Estimated as $38 \%$ of commercial buses (less transit motor buses). Commercial bus total found in Highway Statistics 1994, Table MV-10, and annual.

## School buses:

U.S. Department of Transportation, Federal Highway Administration, Highway Statistics 1994, Washington, DC, 1994, Table MV-10, p. 20, and annual.

## Vehicle-miles and Passenger-miles

## Transit buses:

American Public Transit Association, 1994-95 Transit Fact Book, Washington, DC, February 1995, pp. 106, 107, and annual.

## Intercity buses :

1970-80 - American Bus Association, Annual Report, Washington, DC, annual.
1985-94 - Eno Transportation Foundation, Transportation in America, Thirteenth edition, Washington, DC, 1995, p. 47.
1990-94 vehicle travel - Estimated using passenger travel and an average load factor of 23.2.

## School buses:

1970-80 - U.S. Department of Transportation, Federal Highway Administration, Highway Statistics 1984, Washington, DC, Table VM-1, p. 175, and annual.
1985 - U.S. Department of Transportation, Research and Special Programs Administration, National Transportation Statistics, 1989, Figure 2, p. 7, and annual.
1990-94 - National Safety Council, Accident Facts, 1994 Edition, Chicago, IL, pp. 74-75, and annual.

## Energy Use

## Transit buses:

APTA, 1994-95 Transit Fact Book, February 1995, Washington, DC, pp. 132-135. Nondiesel fossil fuel consumption was assumed to be used by motor buses. For the years 1988-92, motor bus gasoline use was estimated as $5 \%$ of "other" fuels, based o personal communication with the APTA Research and Statistics Department.

## Intercity buses:

1970-80 - American Bus Association, Annual Report, Washington, DC, annual.
1985-93 - Eno Transportation Foundation, Transportation in America, Thirteenth edition, Washington, DC, p. 56. For conversion purposes, fuel for all intercity buses was assumed to be diesel fuel.

## School buses:

1970-80 - DOT, FHWA, Highway Statistics 1984, Washington, DC, Table VM-1, and annual.
1985 - DOT, Research and Special Programs Administration, National Transportation Statistics, Figure 2, p. 5, and annual.
1986-93 - Eno Transportation Foundation, Transportation in America, Thirteenth edition, Washington, DC, p. 56. For conversion purposes, fuel for school was assumed to be half diesel fuel and half gasoline.

## APPENDIX B CONVERSIONS

## A Note About Heating Values

The heat content of a fuel is the quantity of energy released by burning a unit amount of that fuel. However, this value is not absolute and can vary according to several factors. For example, empirical formulae for determining the heating value of liquid fuels depend on the fuels' American Petroleum Institute (API) gravity. The API gravity varies depending on the percent by weight of the chemical constituents and impurities in the fuel, both of which are affected by the combination of raw materials used to produce the fuel and by the type of manufacturing process. Temperature and climatic conditions are also factors. Because of these variations, the heating values in Table B. 1 may differ from values in other publications.

Heating values fall into two categories, gross and net. If the products of fuel combustion are cooled back to the initial fuel-air or fuel-oxidizer mixture temperature and the water formed during combustion is condensed, the energy released by the process is the gross heating value (higher heating value). If the products of combustion are cooled to the initial fuel-air temperature, but the water is considered to remain as a vapor, the energy released by the process is the net heating value (lower heating value). Usually the difference between the gross and net heating values for fuels used in transportation is 5 to 8 percent; however, it is important to be consistent in their use.

The figures in this report are representative or average values, not absolute ones. The gross heating values used here agree with those used by the Energy Information Administration (EIA). Gross heating values were used for all energy conversions in this report.

=207.92 \mathrm{bbl} / \mathrm{year}
$$

## For Imperial gallons, multiply above values by $\mathbf{1 . 2 0 1}$

${ }^{a}$ The conversions for flow rates are identical to those for volume measures, if the time units are identical.

$$
\begin{aligned}
& 1 \text { liter } / \mathrm{hr} \quad=0.8474 \mathrm{ft}^{3} / \mathrm{day} \\
& =6.298 \text { U.S. gal/day } \\
& =5.28 \text { imperial gal/day } \\
& =0.1510 \mathrm{bbl} / \text { day } \quad=55.10 \mathrm{bbl} / \text { year } \\

| Ft-lb per sec | $1.36 \times 10^{-3}$ | $1.356 \times 10^{-3}$ | $1.84 \times 10^{-3}$ | 1 | $0.3238 \times 10^{-3}$ | $1.285 \times 10^{-3}$ |
| Kilocalories per sec | 5.615 | 4.184 | 5.692 | 3088 | 1 | 3.968 |
| Btu per sec | 1.415 | 1.055 | 1.434 | 778.2 | 0.2520 | 1 |

Table B. 8
Mass Conversions

|  |  |  | TO |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | Pound | Kilogram | Short ton | Long ton | Metric ton |
| Pound | 1 | 0.4536 | $5.0 \times 10^{-4}$ | $4.4643 \times 10^{-4}$ | $4.5362 \times 10^{-4}$ |
| Kilogram | 2.205 | 1 | $1.1023 \times 10^{-3}$ | $9.8425 \times 10^{-4}$ | $1.0 \times 10^{-3}$ |
| Short ton | 2000 | 907.2 | 1 | 0.8929 | 0.9072 |
| Long ton | 2240 | 1016 | 1.12 | 1 | 1.016 |
| Metric ton | 2205 | 1000 | 1.102 | 0.9842 | 1 |

Table B. 9
Fuel Efficiency Conversions ${ }^{\text {a }}$
$\left.\begin{array}{cccccc}\hline & & & & \begin{array}{c}\text { Miles/ } \\ \text { kilowatt-hours }\end{array} \\ \text { MPG } & \text { Miles/liter } & \text { Kilometers/L } & \text { L/100 kilometers } & \begin{array}{c}\text { Kilowatt-hours/ } \\ \text { (gasoline-equivalent) }\end{array} \\ \hline \text { (gasoline-equivalent) }\end{array}\right]$
${ }^{\text {a }}$ To convert fuel efficiency from miles per gallon to liters per hundred kilometers, divide mpg into 235.24.
${ }^{\mathrm{b}}$ Based on gasoline Btu content of $125,000 \mathrm{Btu} /$ gallon and $3,412 \mathrm{Btu} / \mathrm{kWhr}$.

Table B. 10
SI Prefixes and Their Values

|  |  |  |  |
| :--- | :--- | :--- | :--- |
|  | Value | Prefix | Symbol |
| One million million millionth |  |  |  |
| One thousand million millionth | $10^{-18}$ | atto | a |
| One million millionth | $10^{-15}$ | femto | f |
| One thousand millionth | $10^{-12}$ | pico | p |
| One millionth | $10^{-9}$ | nano | n |
| One thousandth | $10^{-6}$ | micro | m |
| One hundredth | $10^{-3}$ | milli | m |
| One tenth | $10^{-2}$ | centi | c |
| One | $10^{-1}$ | deci |  |
| Ten | $10^{0}$ |  |  |
| One hundred | $10^{1}$ | deca |  |
| One thousand | $10^{2}$ | hecto |  |
| One million | $10^{3}$ | kilo | k |
| One billion | $10^{\text {a }}$ | $10^{9}$ | mega |
| One trillion | $10^{\mathrm{a}}$ | $10^{15}$ | giga |
| One quadrillion | tera | G |  |
| One quintillion | a | $10^{18}$ | T |

${ }^{\text {a }}$ Care should be exercised in the use of this nomenclature, especially in foreign correspondence, as it is either unknown or carries a different value in other countries. A "billion," for example, signifies a value of $10^{12}$ in most other countries.

Table B. 11
SI (Metric) Units and Symbols

| Quantity |  |  |
| :--- | :--- | :--- |
|  | Unit name | Symbol |
| Energy | joule |  |
| Specific energy | joule/kilogram | J |
| Specific energy consumption | joule/kilogram•kilometer | $\mathrm{J} / \mathrm{kg}$ |
| Energy consumption | joule/kilometer | $\mathrm{J} /(\mathrm{kg} \cdot \mathrm{km})$ |
| Energy economy | kilometer/kilojoule | $\mathrm{J} / \mathrm{km}$ |
| Power | kilowatt | $\mathrm{km} / \mathrm{kJ}$ |
| Specific power | watt/kilogram | Kw |
| Power density | watt/meter | $\mathrm{W} / \mathrm{kg}$ |
| Speed | kilometer $/ \mathrm{hour}$ | $\mathrm{W} / \mathrm{m}^{3}$ |
| Acceleration | meter/second ${ }^{2}$ | $\mathrm{~km} / \mathrm{h}$ |
| Range (distance) | kilometer | $\mathrm{m} / \mathrm{s}^{2}$ |
| Weight | kilogram | km |
| Torque | newton $\bullet m e t e r$ | kg |
| Volume | meter ${ }^{3}$ | $\mathrm{~N} \cdot \mathrm{~m}$ |
| Mass; payload | kilogram | m |
| Length; width | meter | kg |
| Brake specific fuel consumption | kilogram/joule | m |
| Fuel economy (heat engine) | liters $/ 100 \mathrm{~km}$ | $\mathrm{~kg} / \mathrm{J}$ |
| Air pressure |  | $\mathrm{L} / 100 \mathrm{~km}$ |

## Conversion of Constant Dollar Values

Many types of information in this data book are expressed in dollars. Generally, constant dollars are used--that is, dollars of a fixed value for a specific year, such as 1990 dollars. Converting current dollars to constant dollars, or converting constant dollars for one year to constant dollars for another year, requires conversion factors (Table B. 12 and B.13). Table B. 12 shows conversion factors for the Consumer Price Index inflation factors. Table B. 13 shows conversion factors using the Gross National Product inflation factors.

## Table B. 12

Consumer Price Inflation (CPI) Index

| From | To |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## APPENDIX C

# ACTIVITY AND ENERGY USE IN TRANSPORTATION: DATA SOURCES FOR THE LBL ANALYSES OF OECD COUNTRIES. 

Lee Schipper, International Energy Studies Lawrence Berkeley Laboratory ${ }^{1}$

## 1. BRIEF REVIEW OF SOURCES AND EXPLANATION.

## Generic Comments.

This note explains the mostrecent LBL collection and analysis of data covering the structure of travel and freight energy use in twelve OECD countries. In general the LBL analyses follow major sources from each country. Where these are incomplete, we proceed bottom-up using each country's main data sources on vehicle activity, as well as travel (passenger-kilometers) and freight (tonne-kilometers). Aggregate data on traffic, travel and freight by mode (including data for car travel derived usually from travel surveys) are split where possible by fuel, i.e., into activity for gasoline, diesel, and liquified petroleum gas (LPG). Fuel data are developed by each country source, typically by first parsing reported data (rail, bus, some trucking, domestic shipping, domestic air travel) and then splitting the remaining road fuels into modes. Usually we follow our sources, but important exceptions are Sweden, Denmark, and Italy, where we have tried to resolve often conflicting information from a number of experts and published sources. For rail energy use, we assume (unless data show otherwise) that electricity is used only for passenger travel (as well as for local rail transit) and split the diesel fuel according to a formula where two passenger-km traveled are equal to one tonne-km of freight hauled. (For air freight, we parse according to weight, approximately seven passengers (with baggage) equals one tonne. We usually do not analyze minor modes (motorcycles and mopeds, and waterborne travel in most countries) and omit pipelines for most countries because of a lack of data on volume (tonne-km) or energy consumed, or both. We omit international shipping and try to eliminate fuel use for international passenger and freight air transport because there are virtually no data on activity by country of traveler. We also use each country's travel surveys to check modal distributions with the aggregate sources.

[^46]To insure comparability with the U.S. we have taken these precautions with "cars." First, we count U.S. personal light trucks (approximately $2 / 3$ of all light trucks and light truck travel) with automobiles, since these are clearly used as household vehicles and now make up more than $20 \%$ of the household vehicle stock. Light trucks and vans in Australia, Denmark and Britain are also counted with automobiles, making up about 3-5\% of the stock. Light trucks and vans in the other Nordic countries (roughly $2 \%$ of the household vehicle stock), however, cannot easily be separated from other trucks, so are not counted as "cars." Mini-cars in Japan are counted as cars. Light trucks or vans are not important as household vehicles in Italy, Germany, and France.

## Australia

We present for the first time a complete set of data for Australian travel and energy use, covering the period 1971 to 1993. The figures were worked out by the Bureau of Transport and Communications Economics (BTCE) of the Australian Government, Canberra, and transmitted by Leo Dobes, David Gargett, and David Cosgrove. These officials provide some unpublished estimates to complement the data found in publications listed below. The original sources of the data were the Australian government's Survey of Motor Vehicle Use, taken every three years since 1976, with BTCE interpolating the missing years, and The Motor Vehicles Census, both published by the Australian Bureau of Statistics.

BTCE estimated traffic, travel or freight output, and energy use for each kind of road vehicle (cars by fuel, light trucks by fuel, heavy trucks by fuel and type, buses by fuel), for urban light rail and heavy rail and for interurban passenger and freight rail. Rail energy use data were published for 1976, 1985, 1988 and 1991, with other years interpolated. Electricity was given as final demand. Bus is estimated with constant vehicle intensities (MJ/vehiclekm ) for urban and inter-urban buses and estimates of vkt for each type of travel. They also estimated travel and energy use for domestic air transport, for domestic air freight, for domestic (coastal) shipping, and estimated travel for ferries as well. We modified these figures only to split activity and energy use of light trucks into a component for travel (according to BTCE's unpublished estimates). We extrapolated the split of rail travel and freight activity and energy use by electric and diesel traction for 1971-1973 assuming constant shares of each energy source and constant intensities for those years at the 1974 levels.

Fuel prices were given by BTCE back to 1975 for LPG and diesel, and for gasoline back to 1971. We estimated diesel prices for 1971-1974 from a price index provided by BTCE, and assume LPG followed the same trends. Until the late 1970s gasoline totally dominated the mix of fuels for automobiles.

## Denmark

Data come from a variety of government and automobile industry sources. Through an earlier contract with the Danish Energy Agency, an LBL team helped authorities revise data forenergy and transportation. Data for vehicle use and fuel consumption are provided for each type of vehicle by fuel type: cars, light trucks (under one tonne), buses, various sizes of trucks. Data on passenger travel are provided by the Ministry of Transport publications, with one important exception. Official sources use a constant automobile load factor for the entire 1970-1993 period to convert vehicle-km to passenger-km. After reviewing a number of studies of travel and load factor, we concluded that this was incorrect We start with a figure of 1.85 for 1970 and, using surveys for 1975, 1981, 1986, and 1992 and estimating the impact of including children and older people not counted in these surveys, arrive at a load factor close to 1.6 for 1992, using interpolation for years not surveyed. As a result, our data show lower total travel in Denmark than Danish data, and significantly less growth in travel. Light trucks ("vaerebiler") under 1 tonne capacity are counted with automobiles. Foreign (transit) truck traffic is excluded from both tonne-km and energy consumption calculations.

New car fuel economy data are tabulated from sales weighted data for the 20 best selling cars (through 1987), the ten best selling cars (1989), and all new cars (1991 and 1993). Comparison of results from only the ten or twenty best sellers of 1991 or 1993 show little deviation from the complete sample. The jump in fuel consumption in the 1993 new cars appears real, as it followed a significant decrease in fuel prices.

## Finland

The figures were first worked out as part of an LBL project undertaken for the Ministry of Trade and Industry O. Koskonen of the Ministry of Transport provided the ministry's estimates of road vehicle activity and fuel use by mode, while almost all other data come from the annual: Transport and Communications Statistical Yearbook for Finland 1993 (and previous years) of the Finnish Bureau of Statistics.

Aviation. Energy consumption data for aviation come from statistics from Finnair (including Finnair, Finnaviation and Karair). Passenger-km and tonne-km of freight are from Civil Aviation Administration (Statistics of Finnish Civil Aviation 1970-1980 and 1980-1993). Domestic fuel use for 1989-1993 was provided by Finnair. For earlier years, we took the total fuel supplied to Finnish aircraft flying within Finland or leaving Finland (from the Transport Statistics) and related this to all domestic passenger travel and $1 / 2$ of the passenger travel flown by the same Finnish airlines to give outbound traffic only and therefore corresponding to outbound fuel use. Using the ratio of total outbound energy use to total outbound traffic, we formed an energy intensity (in MJ/passenger-km) which we multiplied by domestic-only travel to get domestic fuel use. For the years after 1989 this result came very close to the intensity given by Finnair.

Rail. Almost all data for the rail traffic are derived from the yearbook of Valtion Rautatiet (State Railways). This includes passenger-km, tonne-km, train-km and consumption of both electricity and diesel. In addition to this we took the metro and trams in Helsinki into account. This information (both activity and energy data) refers $\mathfrak{b}$ Helsingin Kaupungin Liikennelaitos (Helsingfors Trafikverket, Helsinki Transportation Company).

Road Traffic. Information about the vehicle stock comes from the Stat. Yearbook. Activity data are partly from a database maintained by the Ministry of Transport (O. Koskinen, priv.comm.), which includes vehicle-km for both travel and freight by vehicle type and fuel. To this data we added information on buses in Helsinki (Helsingfors Trafikverket). Vehicle-km for cars for the years 1970-1974 come from the Ministry database, but for the remaining years we used information from National Road Administration. The published statistics of the Road Administration use 12000 km as their length of street network in 1975-1991 and after that switch to 15000 km . To avoid this discrepancy in the data set we used a continuous times series based on a 15000 km long street network recently processed by the Road Administration. Passenger -km for cars are from Road Administration. Passenger-km for buses and motorcycles refer to the source "Transport and Communications Statistical Yearbook of Finland 1993." Passenger-km for the buses in Helsinki are from Helsingfors Trafikverket.

Activity for freight is derived from Tavaraliikenteen Tavarankuljetustilasto, Road Administration (Statistics of freight). No published data exist for tonne-km for vans, which we refer to as light trucks in our analyses. Therefore we had to use the estimate 0.33 tonne-km / vehicle-km.

Information on energy consumption for road traffic is based on the earlier mentioned database from the Ministry of Transport. We complemented these data with the information on specific consumption of new cars sold each year estimated by Harri Kallberg of Neste, the State Oil Company (priv. comm.). Fuel intensity for cars is derived; fuel economy for new cars was estimated by Kallberg through 1988 only.

Water traffic. For water traffic energy consumption data come from the Energy Statistics. Activity (boh passenger-km and tonne-km) come from the Statistical Yearbook for the years 1971-1993. Data for 1970 are from Tie- ja Vesirakennus Hallitus (Road and Water Administration).

## France

Energy use data are both derived from the following sources: Tableaux des Consommations d'Energie en France (Observatoire de l'Energie), Les Comptes des Transports, (INSEE, the National Statistical Office, in their series Resultats), and Didier Bosseboeuf of ADEME, l'Agence d"Environment et de la Maitrise de l'Energie.

Activity data are mainly from INSEE, complemented by a few other sources. Air passenger (passenger-km) and seat activity (seat-km) data refer to Air Inter, which handles approximately $95 \%$ of all domestic flights. Ral activity data for both intercity (passenger-km) travel and freight (tonne-km) refers to SNCF. Bus activity (passenger-km) assumes a load factor (LF) of 23 for years 1970-1980 (which is about the 1983-87 average). It is estimated by multiplying this LF with known vehicle-km numbers.

Vehicle use data are based on the following assumptions: (a) automobile use ( $\mathrm{km} / \mathrm{car} / \mathrm{yr}$ ) for years 1970, 1971, and 1973 is estimated assuming a load-factor (LF) of 1.85 and using activity (passenger-km) and stock data; and (b) gasoline-powered automobile use was estimated, assuming that diesel cars in 1970 went 2.4 times as far as the average car, which narrowed to 2.0 times by 1988 (refer to Observatoire de l'Energie).

Automobile energy use includes liquid petroleum gas (LPG). The 1970-1972 data for both gasoline and diesel powered automobiles are estimated by multiplying toe/vehicle and stock of vehicles. Air energy use is fuel used for domestic flights by Air Inter. After 1985, a new means of accounting for diesel energy use for buses was adopted. Rail electricity use data of SNCF and RATP are converted from primary to delivered energy.

Assumptions for energy use include: (a) 1970-1972 data for gasoline-powered automobiles are based on the 1974 ratio of tons of oil equivalent (toe) and vehicle-kilometers; (b) for these same years, it is assumed that fued economies (MJ/vehicle-km) were about constant for both diesel and gasoline cars in years 1970 and 1973. This assumption was made to approximate average fuel economy estimates supplied by Didier Bosseboeuf; (c) 95\% of air energy use is for passenger use (which is derived from Air Inter's energy intensity figures (MJ/passenger-km) for domestic flights; and (d) passenger share of rail transport assumes one passenger-kilometer (passenger-km) uses as much energy as 1.25 ton-kilometers (tonne-km), which coincides with 1988 data. After 1988 there is a slight series break in the accounting for automotive diesel.

New car fuel economy for diesel and for gasoline are published in the Tableaux and in Les Comptes en Transports.

Didier Bosseboeuf of the Agence d'Environment et Maitrise d'Energie provided essential data, interpretation, and comments on the analysis.

## Germany (West)

The primary source of data on transportation and energy use is: Deutsches Institut fuer Wirtschaftsforschung Verkehr in Zahlen (various editions). This handbook contains a nearly complete set of data for traffic, travel and freight activity and energy use from 1950 to 1993. We had to assume, however, that $1 / 3$ of air fuel was for domestic travel, and form our own split of rail energy into travel and freight components. Additional supporting data for rail and air travel are from: Deutsches Institut fuer Wirtschaftsforschung: Detaillierung des Energieverbrauchs in der BRD im HuK, Industrie und Verkehr nach Verwendungswecken; and Deutsches Institut fuer Wirtschaftsforschung, Der Endenergieverbrauch im Sektor Verkehr nach Subsektoren sowie nach Verwendungsarten und Verkehrsbereichen (1984).

Estimates of new car fuel economy (using static tests and using road tests) are published by DIW in their Wochenblatt series. We show the static test values, for both gasoline and diesel. The latest data available were for 1991.

## Italy

Major sources data include: ANFIA, L'automobile in cifre, 1988; AGIP Petroli; Ministero dei Trasporti, Conto Nationale Trasporti (Anno 1988 e prime anticiazioni per il 1989 and subsequent years); Ministero dei Trasporti, Piano Generale Trasporti; ISTAT: Sommario di Statistiche Storiche; and International Road Federation (IRF), World Road Statistics.

Energy use data come from the following sources: AGIP Petroli; Unione Petrolifera; Ministero dei Trasporti, Piano Generale Trasporti; Ministero dell'Industria, Commerciol ed Artigianato, Bilancio Energetico Nazionale.

Automobile vehicle use data include average kilometers traveled by both gasoline, LPG, and diesel cars. Truck vehicle use data include 3-wheeled trucks. These are estimated for urban and intercity activity, the latter of which refers to freeways and trunk roads. Pipeline activity data include pipelines greater than 50 kilometers.

Intracity passenger and freight movement data exist only for rail. All other intracity movement (bus, car, truck) are estimates by AGIP Petroli.

Energy use from coal in rail transport applies the conversion factor of $7500 \mathrm{kcal} / \mathrm{kg}$ (except for 1970 and 1972, which applies 7410 and $6500 \mathrm{kcal} / \mathrm{kg}$, respectively. Assumptions in energy use include: (a) diesel passenger share used in calculating total energy use in rail transport assumes transporting 1.25 persons is equivalent to 1 ton; (b) passenger share of jet fuel use is estimated at $97 \%$ which is similarly used for other countries; and (c) jet fued domestic share energy use is estimated at $18 \%$ for 1973 and grows at $1 \%$ per year. This assumption allows consistency with AGIP Petroli's modal intensity figures.

There are some inconsistencies in the energy use data: (a) the public sector diesel consumption drops significantly from 1978 and 1979, suggesting that the 1970-1978 time series may include diesel fuel consumption for heating purposes; (b) truck energy use data, which come from Ministry of Transport, are missing for a number of years (1970-1971, 1973-1977, 1979-1986, and 1988) and therefore have been interpolated. If one tries to calculate energy use, weighted by activity (vehicle-km), different numbers result. The question concerns how the Ministry of Transport arrived at their calculations; (c) data on energy consumption of jet fuel in air transport for years 19761978 were adjusted to correct for inconsistency; and (d) end-use energy data from the Ministry of Industry appear to be high. It is uncertain if the data include other uses, like heating or cooking.

Data on new car fuel intensity were provided by Agip Petroli (through 1988). No more recent data were available.

Allesandro Liberati 0of Agip Petroli and Romeo Dines of the Univ. of Trieste provided data and helpful comments.

## Japan

Two sources publish data on transportation energy consumption in Japan: (1) the Ministry of Transport (MOT) and (2) the Ministry of International Trade andIndustry (MITI) in cooperation with the Energy and Data Modeling Center (EDMC) of the Institute of Energy Economics (IEE). However, only the MOT collects data through direct
surveys, whereas MITI and IEE derive figures for energy consumption through indirect calculation. MITI assumes average fuel-intensity levels and derives energy consumption in a top-down fashion, a practice criticized as unreliable in an earlier study done at Lawrence Berkeley Laboratory (LBL). In addition, of these agencies only the EDMC performs detailed energy analyses of the country's transportation sector, but few of these studies ae published outside of Japan.

We use MOT data as the most accurate, bearing in mind the following changes in the data series: before 1981, road vehicle fuel consumption figures are based only on fuel sales data; since 1981, the MOT has conducted surveys, with more modes included in a consistent manner; since 1987, mini-car and mini-truck transport has been counted. We have extrapolated data on the use of mini-cars from after 1987 to prior years using a constant yearly driving distance and the known number of these small vehicles. We assume a load factor of 1.5. The Japanese sources show a significant increase in all automobile load factor after 1987, which boosts passenger travel in this mode by over $10 \%$ in one year. We can find no explanation for this rapid change. Although some uncertainties still remain, the characteristics of energy use in Japanese transportation are so striking, and the changes observed so large, compared with the uncertainties, that we feel any conclusions drawn from our data are robust.

New car fuel consumption according to the " 10 Mode test" are provided in the EDMC yearly Energy Handbook.

Naoto Sagawa of the Institute for Energy Economics and K. Minato of the Japan Auto Research Institute provided helpful comments.

## Netherlands

Principal source of data is the yearbook of the Ministry of Transport, Public Works, and Water Management, Zakboek verkeers en vervoersstatistieken. This contains traffic and energy use data by fuel type and mode and travel by mode from 1985. Earlier years are estimated from a variety of sources, with automobile fuel use data back to 1970. Many sources do not distinguish between travel on city trams/subway or bus, but tram/metro travel can be separated out using passenger travel statistics for bus. However, local and intercity rail services are both provided by NS, the National Railway, so these cannot be distinguished. Erna Schol of Energieunderzoek Centrum Nederlands (ECN) and Jacco Farla of the Univ. of Utrecht assisted in the analysis of a large number of data sources.

From the mid 1970s, CBS provides data on car ownership and vehicle-km by fuel type, and fuel consumption as well. We exclude the use of Dutch vehicles outside of Holland (since the energy use is not included) and we also exclude foreigner's driving and fuel use in Holland. Thus the figures given underestimate the auto-mobility and fuel use of the Dutch by about 5\% (early 1970s) up to $10 \%$ (early 1990s). Bus and rail activity data, however include passengers of all nationalities and include the domestic portions of foreign trips. Accurate data on fuel use for rail and bus were not available for all years. No data are available for the small amount of domestic air travel or its fuel use.

For freight, the activity data include imports and exports butnot freight carried by foreign trucks transiting Holland. Accurate splits of fuel use for all modes were not available for all years.

The sales-weighted new-car fuel economy was not available.

## Norway

Estimates of passenger- and tonne-km activity are published in Samferdsel Statistikk (Transportation Statistics) and in publications from Transport Oekonomisk Institute (TOI) in Oslo. Estimates of automobile use stem from surveys taken in 1967, 1973, 1981, and 1985-88, "Eie og Bruk av Bil." Numbers of vehicles are published in Samferdsel statistikk and in Bil og Vei, the publication of the Norwegian Road Authority (Veg Direktorat). "Cars" (biler) includes virtually all vehicles, but "person biler" represents automobiles for private and business use.

Energy use by mode is poorly documented in public literature. The Bureau of Statistics publishes "Road", "Rail", "Ship", and "Air" energy use by fuel in their yearly Energistatistikk and Energiregnskap. Data from 1976 to 1980 and 1980 to 1986 contain many detailed breakdowns of individual transportation mode's energy use (and activity). Esso (A. Kvamme, priv. comm.) has made their own research into the matter, breaking both the automobile and truck fuel markets into considerable detail. Because the Esso data cover the longest period (1970 to present) and
make the most detailed attempt to balance all the various liquid fuels markets, we use the data they kindly provided to match energy use, activity, and energy use per vehicle-km.

Transport Economics Institute has estimated the fuel economy of new cars by examining the most popular models sold and their test fuel consumption.

## Sweden

The data on energy use come from two sources: the National Energy Administration (STEP, now GNATHIC); and the Transportation Council (TAR, now taken over by the Highway Institute in Linköping). In 1977 SIND (the predecessor to STEP) prepared a forecast of energy use in Sweden that was based in part upon detailed breakdowns of energy use in the transportation sector provided by the predecessor of TAR. These were "updated" in subsequent energy studies published by STEP. TAR has continually published data on passenger- and tonne-km, as well as on vehicle-km. The Central Bureau of Statistics publishes data on the characteristics of the vehicle stock. The Swedish Automobile Association and AB Bilstatistik publish a yeabook with other details of the vehicle stock, such as the number of cars by weight. New car fuel economy, based on tests, is weighted by sales by the car industry and provided by the Ministry of Trade.

In the 1980s J. Wajsmann of TAR began a systematic bottom-p analysis of energy use in the transportation sector. His unpublished analyses have been provided to STEP for their own yearly breakdowns of Swedish energy use.

In these he examines the number of vehicles, km driven and consumption of fuel per km for four types of cass (gasoline private cars and taxis, and diesel private cars and taxis), buses, and trucks. He covers domestic air travel and inland shipping, as well as many smaller users of liquid fuels. Data on electricity use for the railways and local transit are published by the Central Bureau of Statistics' El och Fjaerrvaerme Försörjning (Electricity Supply Statistics). Wajsmann's analyses cover 1980, and 1983 to 1989. The match with the 1970-76 data is not perfect, but acceptable for our purposes. Using data on the stock of vehicles and modal activity, we have reconstructed 1978 and 1981-82 energy use patterns and interpolated remaining years between 1976 and 1983. We have also estimated automobile vehicle-km and fuel economy for 1970-1976, since the SIND data and their TAR source contain very little information on these two parameters. However, Energiprognosutredning (1974) provides a detailed breakdown of transportation energy use in 1970 and some infomation for 1973. Assembling these together we believe we have created a reasonable picture of the 1970-76 period that can be compared with the period from 1980 to the present. Finally, a large number of smaller official and unofficial publications reviewed in Appendix 3 of Schipper L.J. and Johnson F., withHowarth R., Andersson B.E., Anderson B.G., and Price LK. 1993. Energy Use in Sweden: An International Perspective. Lawrence Berkeley Laboratory Report LBL-33819. Berkeley, CA: Lawrence Berkeley Laboratory. Published as Schipper and Price 1994 in Nat. Res. Forum (May)

## United Kingdom (Great Britain)

Transportation activity and energy data are taken from the U.K. Digest of Transportation Statistics, published yearly by the Department of Transport. These contain data covering Great Britain (England, Wales, and Scotland), and, for a few tables, the United Kingdom (ie., including N. Ireland) as well. Most data are taken directly from this source. Fuel use for road vehicles from 1981 was re-analyzed by B.Oelman, Dept. of Transport (priv. comm.). Light trucks and small vans are counted with automobiles. Oelman also estimates fuel economy of new cars.

Department of Transport (DOT). 1970-1994. Transport Statistics: Great Britain. London, UK: Her Majesty's Stationery Office

Transport Department, various years. National Travel Survey. (1972/3, 1982/3, 1985/6, 1990/91) London, UK: Her Majesty's Stationery Office

## United States

The transportation data come from three major sources: Oak Ridge National Laboratory (ORNL) and the US Department of Transportation (DOT). Virtually all of the time-series data beginning from 1970 to the present are extracted from ORNL's Transportation Energy Data Book: Editions 11-14, 1991-1994. and subsequent editions, and FHWA Statistical Summary to 1985.

Energy use data are from ORNL's Data Books.

Assumptions for vehicle use (vehicle-km) and energy use include: (a) light trucks have the same mileage as automobiles, and the share used as personal vehicles is taken from the ORNL data book (for example Table 2.12 of Edition 12.); (b) all light freight vehicle use is assumed to be for intracity transport; (c) domestic air is estimated at $87 \%$ of total vehicle-km. Load factor (LF) estimates include the following: (a) automobile LF is estimated at 2.2 persons from 1960 to 1970 . It then decreased to 1.87 by 1977, 1.7 by 1983, and 1.59 in 1990. (b) motorcycle LF (motorcycles are not shown in this work) is estimated at 1.1 persons; (c) personal truck LF is estimated at the same as that of the automobile LF; (d) intracity light truk LF is estimated at 0.25 tons/truck; (e) intracity mid-size trucks is estimated at 5 tons/truck; and (f) school bus load is estimated at 20 persons.

Two areas of concern are: (a) a discrepancy exists between automobile stock cited in ORNL (Polk) and DOT FHWA. The former survey shows fewer cars than FHWA; and (b) there is a growing population of light trucks used solely for personal travel. TIUS survey data (reported in ORNL and used in the time-series data on stock and activity) show the share of trucks used for personal travel growing from approximately $25 \%$ in 1960 to $65 \%$ in 1988, which we extrapolate to $68 \%$ by 1993.

## 2. RECENT REVISIONS REFLECTED IN THE PRESENT DATA.

From time to time our national sources revise data as better estimates of the components of energy use and transportation activity are made available. In this edition our data from Italy, Denmark, United Kingdom, Sweden, and Japan have been significantly revised as new historical material appeared.

- The Danish Road Authoritypublished its first own comprehensive road statistics in 1994, which covered data (much revised) through 1992. this book still assumes a constant load factor for automobile use throughout the entire 1970s and 1980s but acknowledges that the national travel surveys give different results. We have used these sources to derive our own estimates of passenger km traveled in cars and personal light trucks; The authority, along with theDanish Energy Agency and Ministry of Transport, also revised their estimates of fuel used, particular that of road diesel. The Ministry of Transport provided its revised figures for energy use by mode and fuel through 1993. These revisions reflect both best estimates of diesel used by foreign vehicles and use of diesel for space heating. Significant numbers of diesel users obtain their fuel almost tax free and it is believed some of this is used as heating oil, which is heavily taxed.
- For France, the long-standing yearlyTableaux des Consummations d'Energie, one of our two main data sources for France, again did not appear in 1995. We have relied on the Les Comptes des Transports as published by INSEE, and these appear to be consistent with both earlier years and with the data published by our earlier source. This source will replace all others in the future.
- Data for Western Germany come from the same source each year and show no revisions. In future work we will try to incorporate figures for Eastern Germany, where car ownership has almost reached the level of western Germany.
- For Italy, we received for 1992 new estimates of fuel use from AGIP, the Italian State Oil Company, as well as the latest National Accounts for Transportation. AGIP estimates the contribution of local traffic (intra city use of cars and trucks) to totals. We have estimated energy use by mode for 1975-1978 using interpolation. However, we have not received enough information to work out trends for 1993.
- For Japan, we have prepared a separate analysis of trends in transportation activity and energy use in Japan from 1965 to 1993 (Kiang and Schipper, to appear in Energy Policy). As with last year, our key modifications include estimates of activity of small mini-cars and mini-trucks, including our estimate of the passenger travel in mini-cars back to 1965 (based on load factors from 1987 onward). We cannot explain the jump in automobile load factor for "normal" carsthat appeared in 1987. This load factor is obtained by comparing time series for vehicle-km and passenger-km for automobiles from the same source.
- We revised our travel data and energy use (for cars) for Netherlands through 1993. Car use data now reflect travel by Dutch within the borders of the Netherlands.
- For Norway, we continue to lack figures on fuel use for domestic aviation, as these fail to distinguish domestic from international traffic. Fuel use figures for domestic shipping reflect some revisions as the Bureau of Statistics provides more detailed data in their yearly Energy Balances. Fuel-use figures for road traffic are still provided by Esso, who has made small revisions from time to time.
- For Sweden, SIKA was supposed to assume the responsibility for quarterly publications previously available from the Swedish Road Institute in Linköping (VTI Transportstatistik). Unfortunately, these include almost no information on automobile use, but do reflect data obtained from the Bureau of Statistics for other modes. SIKA provide us with the data they also submit to the European Council of Ministers of Transport in Paris, also based on Bureau of Statistics data. These data entail slight revisions in freight activity. For automobile activity, there are still no widely-accepted figures for either vehicle-km or passenger-km. We used extrapolated last year's estimates developed by the Road Institute (H. Jönsson, priv. comm.) as the basis for our activity estimates, and a load factor of 1.5 to get passenger-km. Our estimate of fuel use per km for automobiles is higher than theirs and is documented in an appendix to Schipper et al. 1993. Fuel use for domestic air travel is no longer available now that SAS is not the only carrier. Unfortunately, a domestic fuel carbon tax is calculated indirectly, and not on actual fuel consumed. In all the figures presented for energy use in Sweden and for vehicle activity of cars for both 1992 and 1993 should be considered preliminary.
- The U.K. Ministry of Transport carefully reviewed all trends in road vehicle activity and fuel use from 1982. The update results, were once again communicated to us by Bruce Oelman, and used to revise our figures from that year on.

## GLOSSARY

Acceleration power - Measured in kilowatts. Pulse power obtainable from a battery used to accelerate a vehicle. This is based on a constant current pulse for 30 seconds at no less than $2 / 3$ of the maximum open-circuit-voltage, at $80 \%$ depth-of-discharge relative to the battery's rated capacity and at $20^{\circ} \mathrm{C}$ ambient temperature.

Air Carrier - The commercial system of air transportation consisting of certificated air carriers, air taxis (including commuters), supplemental air carriers, commercial operators of large aircraft, and air travel clubs.

Certificated route air carrier: An air carrier holding a Certificate of Public Convenience and Necessity issued by the Department of Transportation to conduct scheduled interstate services. Nonscheduled or charter operations may also be conducted by these carriers. These carriers operate large aircraft ( 30 seats or more, or a maximum payload capacity of 7,500 pounds $\alpha$ more) in accordance with Federal Aviation Regulation part 121.

Domestic air operator: Commercial air transportation within and between the 50 States and the District of Columbia. Includes operations of certificated route air carriers, Pan American, local service, helicopter, intra-Alaska, intra-Hawaii, all-cargo carriers and other carriers. Also included are transborder operations conducted on the domestic route segments of U.S. air carriers. Domestic operators are classified based on their operating revenue as follows:

Majors - over $\$ 1$ billion
Nationals - \$100-1,000 million
Large Regionals - \$10-99.9 million
Medium Regionals - \$0-9.99 million

International air operator: Commercial air transportation outside the territory of the United States, including operations between the U.S. and foreign countries and between the U.S. and its territories and possessions.

Supplemental air carrier: A class of air carriers which hold certificates authorizing them to perform passenger and cargo charter services supplementing the scheduled service of the certificated route air carriers. Supplemental air carriers are often referred to as nonscheduled air carriers or "nonskeds".
Amtrak - See Rail.

Automobile size classifications - Size classifications of automobiles are established by the Environmental Protection Agency (EPA) as follows:

Minicompact - less than 85 cubic feet of passenger and luggage volume. Subcompact - between 85 to 100 cubic feet of passenger and luggage volume.
Compact - between 100 to 110 cubic feet of passenger and luggage volume.
Midsize - between 110 to 120 cubic feet of passenger and luggage volume.
Large - more than 120 cubic feet of passenger and luggage volume.
Two seater - automobiles designed primarily to seat only two adults.
Station wagons are included with the size class for the sedan of the same name.

## Aviation-See General aviation .

Aviation gasoline - All special grades of gasoline for use in aviation reciprocating engines, as given in the American Society for Testing and Materials (ASTM) Specification D 910. Includes all refinery products within the gasoline range that are to be marketed straight or in blends as aviation gasoline without further processing (any refinery operation except mechanical blending). Also included are finished components in the gasoline range which will be used for blending or compounding into aviation gasoline.

Barges - Shallow, nonself-propelled vessels used to carry bulk commodities on the rivers and the Great Lakes.

Battery efficiency - Measured in percentage. Net DC energy delivered on discharge, as a percentage of the total DC energy required to restore the initial state-of-charge. The efficiency value must include energy losses resulting from self-discharge, cell equalization, thermal loss compensation, and all battery-specific auxiliary equipment.

Btu - The amount of energy required to raise the temperature of 1 pound of water 1 degree Fahrenheit at or near 39.2 degrees Fahrenheit. An average Btu content of fuel is the heat value per quantity of fuel as determined from tests of fuel samples.

Bunker - A storage tank.

Bunkering fuels - Fuels stored in ship bunkers.

## Bus -

Intercity bus: A standard size bus equipped with front doors only, high backed seats, luggage compartments separate from the passenger compartment and usually with restroom facilities, for high-speed long distance service.

Motor bus: Rubber-tired, self-propelled, manually-steered bus with fuel supply on board the vehicle. Motor bus types include intercity, school, and transit.

School and other nonrevenue bus: Bus services for which passengers are not directly charged for transportation, either on a per passenger or per vehicle basis.

Transit bus: A bus designed for frequent stop service with front and center doors, normally with a rear-mounted diesel engine, low-back seating, and without luggage storage compartments or restroom facilities. Includes motor bus and trolley coach.

Trolley coach: Rubber-tired electric transit vehicle, manually-steered, propelled by a motor drawing current, normally through overhead wires, from a central power source not on board the vehicle.

Calendar year - The period of time between January 1 and December 31 of any given year.

Captive imports - Products produced overseas specifically for domestic manufacturers.

Carbon dioxide ( $\mathbf{C O}_{2}$ ) - A colorless, odorless, non-poisonous gas that is a normal part of the ambient air. Carbon dioxide is a product of fossil fuel combustion.

Carbon monoxide (CO) - A colorless, odorless, highly toxic gas that is a normal by-product of incomplete fossil fuel combustion. Carbon monoxide, one of the major air pollutants, can be harmful in small amounts if breathed over a certain period of time.

Car-mile (railroad) - A single railroad car moved a distance of one mile.

Cargo ton-mile - See Ton-mile.

Certificated route air carriers - See Air carriers .

## Class I freight railroad - See Rail.

Clean Fuel Vehicle - Vehicle meeting the clean fuel vheicle exhaust emissions standards with no restriction on fuel type.

Coal slurry - Finely crushed coal mixed with sufficient water to form a fluid.

Combination trucks - Consist of a power unit (a truck tractor) and one or more trailing units (a semitrailer or trailer). The most frequently used combination is popularly referred to as a "tractorsemitrailer" or "tractor trailer".

Commercial sector - See Residential and Commercial sector .

Commuter railroad - See Rail.

Compact car - See Automobile size classifications .

Constant dollars - A series of figures is expressed in constant dollars when the effect of change in the purchasing power of the dollar has been removed. Usually the data are expressed in terms of dollars of a selected year or the average of a set of years.

Consumer Price Index (CPI) - An index issued by the U.S. Department of Labor, Bureau of Labor Statistics. The CPI is designed to measure changes in the prices of goods and services bought by wage earners and clerical workers in urban areas. It represents the cost of a typical consumption bundle at current prices as a ratio to its cost at a base year.

Continuous discharge capacity - Measured as percent of rated energy capacity. Energy delivered in a constant power discharge required by an electric vehicle for hill climbing and/or high-speed cruise, specified as the percent of its rated energy capacity delivered in a one hour constantpower discharge.

Corporate Average Fuel Economy (CAFE) standards - CAFE standards were originally established by Congress for new automobiles, and later for light trucks, in Title V of the Motor Vehicle Information and Cost Savings Act (15 U.S.C.1901, et seq.) with subsequent amendments. Under CAFE, automobile manufacturers are required by law to produce vehicle fleets with a composite sales-weighted fuel economy which cannot be lower than the CAFE standards in a given year, or for every vehicle which does not meet the standard, a fine of $\$ 5.00$ is paid for every one-tenth of a mpg below the standard.

Crude oil - A mixture of hydrocarbons that exists in the liquid phase in natural underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities.

Crude oil imports - The volume of crude oil imported into the 50 States and the District of Columbia, including imports from U.S. territories, but excluding imports of crude oil into the Hawaiian Foreign Trade Zone.

Current dollars - Represents dollars current at the time designated or at the time of the transaction. In most contexts, the same meaning would be conveyed by the use of the term "dollars".

Disposable personal income - See Income.

Distillate fuel oil - The lighter fuel oils distilled off during the refining process. Included are products known as ASTM grades numbers 1 and 2 heating oils, diesel fuels, and number 4 fuel oil. The major uses of distillate fuel oils include heating, fuel for on-and off-highway diesel engines, and railroad diesel fuel.

## Domestic air operator - See Air carrier.

## Domestic water transportation - See Internal water transportation .

Electric utilities sector - Consists of privately and publicly owned establishments which generate electricity primarily for resale.

Emission standards - Standards for the levels of pollutants emitted from automobiles and trucks Congress established the first standards in the Clean Air Act of 1963. Currently, standards are set for four vehicle classes - automobiles, light trucks, heavy-duty gasoline trucks, and heavyduty diesel trucks.

Energy capacity - Measured in kilowatt hours. The energy delivered by the battery, when tested at C/3 discharge rate, up to termination of discharge specified by the battery manufacturer. The required acceleration power must be delivered by the battery at any point up to $80 \%$ of the battery's energy capacity rating.

Energy efficiency - In reference to transportation, the inverse of energy intensiveness: the ratio of outputs from a process to the energy inputs; for example, miles traveled per gallon of fuel (mpg).

Energy intensity - In reference to transportation, the ratio of energy inputs to a process to the useful outputs form that process; for example, gallons of fuel per passenger-mile or Btu per ton-mile.

Ethanol ( $\left.\mathbf{C}_{2} \mathbf{H}_{5} \mathbf{O H}\right)$ - Otherwise known as ethyl alcohol, alcohol, or grain-spirit. A clear, colorless, flammable oxygenated hydrocarbon with a boiling point of 78.5 degrees Celsius in the anhydrous state. In transportation, ethanol is used as a vehicle fuel by itself (E100), blended with gasoline (E85), or as a gaoline octane enhancer and oxygenate ( $10 \%$ concentration).

## Fixed operating cost - See Operating cost.

## Fleet vehicles -

Private fleet vehicles: Ideally, a vehicle could be classified as a member of a fleet if it is:
a) operated in mass by a corporation or institution,
b) operated under unified control, or
c) used for non-personal activities.

However, the definition of a fleet is not consistent throughout the fleet industry. Sone companies make a distinction between cars that were bought in bulk rather than singularly, or whether they are operated in bulk, as well as the minimum number of vehicles that constitute a fleet (i.e. 4 or 10).

Government fleet vehicles: Includes vehicles owned by all federal (GSA), state, county, city, and metro units of government, including toll road operations.

Foreign freight - Movements between the United States and foreign countries and between Puerto Rico, the Virgin Islands, and foreign countries. Trade between U.S. territories and possessions (e.g. Guam, Wake, American Samoa) and foreign countries is excluded. Traffic to or from the Panama Canal Zone is included.

Gas Guzzler Tax - Originates from the 1978 Energy Tax Act (Public Law 95-618). A new car purchaser is required to pay the tax if the car purchased has a combined city/highway fuel economy rating that is below the standard for that year. For model years 1986 and later, the standard is 22.5 mpg .

Gasohol A mixture of $10 \%$ anhydrous ethanol and $90 \%$ gasoline by volume. There are other fuels that contain methanol and gasoline, but these fuels are not referred to as gasohol.

Gasoline - See Motor gasoline .

General aviation - That portion of civil aviation which encompasses all facets of aviation except air carriers. It includes any air taxis, commuter air carriers, and air travel clubs which do not hold Certificates of Public Convenience and Necessity.

Gross National Product - A measure of monetary value of the goods and services becoming available to the nation from economic activity. Total value at market prices of all goods and services produced by the nation's economy. Calculated quarterly by the Department of Commerce, the Gross National Product is the broadest available measure of the level of economic activity.

Gross vehicle weight (gvw) - The weight of the empty vehicle plus the maximum anticipated load weight.

## Heavy-heavy truck - See Truck size classifications .

Household Consists of all persons who occupy a housing unit, including the related family members and all unrelated persons, if any, who share the housing unit.

Housing unit - A house, apartment, a group of rooms, or a single room occupied or intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which have either (1) direct access from the outside of the building or through a common hallway intended to be used by the
occupants of another unit or by the general public, or (2) complete kitchen facilities for the exclusive use of the occupants. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or unrelated persons who share living arrangements.

Hydrocarbon (HC) - A compound that contains only hydrogen and carbon. The simplest and lightest forms of hydrocarbon are gaseous. With greater molecular weights they are liquid, while the heaviest are solids.

## Income -

Disposable personal income: Personal income less personal tax and non-tax payments.

National income - The aggregate earnings of labor and property which arise in the current production of goods and services by the nation's economy.

Personal income: The current income received by persons from all sources, net of contributions for social insurance.

Industrial sector - Construction, manufacturing, agricultural and mining establishments.

Intercity bus - See Bus.

Internal water transportation - Includes all local (intraport) traffic and traffic between ports or landings wherein the entire movement takes place on inland waterways. Also termed internal are movements involving carriage on both inland waterways and the water of the Great Lakes, and inland movements that cross short stretches of open water that link inland systems.

International air operator - See Air carrier .

## International freight - See Foreign freight.

Jet fuel - Includes both naphtha-type and kerosene-type fuels meeting standards for use in aircraft turbine engines. Although most jet fuel is used in aircraft, some is used for other purposes such as generating electricity in gas turbines.

Kerosene-type jet fuel: A quality kerosene product with an average gravity of 40.7 degrees

API and $10 \%$ to $90 \%$ distillation temperatures of 217 and 261 degrees centigrade. Used primarily as fuel for commercial turbojet and turboprop aircraft engines. It is a relatively low freezing point distillate of the kerosene type.

Naphtha-type jet fuel: A fuel in the heavy naphtha boiling range with an average gravity of 52.8 degrees API and $10 \%$ to $90 \%$ distillation temperatures of 117 to 233 degrees centigrade used for turbojet and turboprop aircraft engines, primarily by the military. Excludes ramjet and petroleum.

Kerosene - A petroleum distillate in the 300 to 500 degrees Fahrenheit boiling range and generally having a flash point higher than 100 degrees Fahrenheit by the American Society of Testing and Material (ASTM) Method D56, a gravity range from 40 to 46 degrees API, and a burning point in the range of 150 to 175 degrees Fahrenheit. It is a clean-burning product suitable for use as an illuminant when burned in wick lamps. Includes grades of kerosene called range oil having properties similar to Number 1 fuel oil, but with a gravity of about 43 degrees API and an end point of 625 degrees Fahrenheit. Used in space heaters, cooking stoves, and water heaters.

## Kerosene-type jet fuel-See Jet fuel.

Large car - See Automobile size classifications .

Light duty vehicles - Automobiles and light trucks combined.

Light truck - Unless otherwise noted, light trucks are defined in this publication as two-axle, four-tire trucks. The U.S. Bureau of Census classifies all trucks with a gross vehicle weight less than 10,000 pounds as light trucks (See Truck size classifications ).

Light-heavy truck - See Truck size classifications .

Liquified petroleum gas (lpg) - Consists of propane and butane and is usually derived from natural gas. In locations where there is no natural gas and the gasoline consumption is low, naphtha is converted to lpg by catalytic reforming.

Load factor - A term relating the potential capacity of a system relative to its actual performance. Is often calculated as total passenger miles divided by total vehicle miles.

Low-emission vehicle - A clean fuel vehicle meeting the low-emission vehicle standards.

Medium truck - See Truck size classifications .

Methanol ( $\mathbf{C H}_{\mathbf{3}} \mathbf{O H}$ ) - A colorless poisonous liquid with essentially no odor and very little taste. It is the simplest alcohol and boils at 64.7 degrees Celsius. In transportation, methanol is used as a vehicle fuel by itself (M100), or blended with gasoline (M85).

Midsize car - See Automobile size classifications .

Minicompact car - See Automobile size classifications .

Model year - In this publication, model year is referring to the "sales" model year, the period from October 1 to the next September 31.

Motor bus - See Bus.

Motor Gasoline - A mixture of volatile hydrocarbons suitable for operation of an internal combustion engine whose major components are hydrocarbons with boiling points ranging from 78 to 217 degrees centigrade and whose source is distillation of petroleum and cracking, polymerization, and other chemical reactions by which the naturally occurring petroleum hydrocarbons are converted into those that have superior fuel properties.

Naphtha-type jet fuel - See Jet fuel.

National income - See Income.

Nationwide Personal Transportation Study (NPTS) - A nationwide home interview survey of households that provides information on the characteristics and personal travel patterns of the U.S. population. Surveys were conducted in 1969, 1977, 1983 and 1990 by the U.S. Bureau of Census for the U.S. Department of Transportation.

Natural gas - A mixture of hydrocarbon compounds and small quantities of various non-hydrocarbons existing in the gaseous phase or in solution with crude oil in natural underground reservoirs at reservoir conditions.

Nitrogen Oxides $\left(\mathbf{N O}_{\mathbf{x}}\right)$ - A product of combustion of fossil fuels whose production increases with the temperature of the process. It can become an air pollutant if concentrations are excessive.

## Operating cost -

Fixed operating cost: In reference to passenger car operating cost, refers to those expenditures that are independent of the amount of use of the car, such as insurance costs, fees for license and registration, depreciation and finance charges.

Variable operating cost: In reference to passenger car operating cost, expenditures which are dependent on the amount of use of the car, such as the cost of gas and oil, tires, and other maintenance.

Organization for Petroleum Exporting Countries (OPEC) - Includes Saudi Arabia, Iran, Venezuela, Libya, Indonesia, United Arab Emirates, Algeria, Nigeria, Ecuador, Gabon, Iraq, Kuwait, and Qatar. Data for Saudi Arabia and Kuwait include their shares from the Partitioned Zone (formerly the Neutral Zone).

Other single-unit truck-See Single-unit truck.

Oxygenate - A substance which, when added to gasoline, increases the amount of oxygen in that gasoline blend. Includes fuel ethanol, methanol, and methyl tertiary butyl ether (MTBE).

Particulates Carbon particles formed by partial oxidation and reduction of the hydrocarbon fuel. Also included are trace quantities of metal oxides and nitrides, originating from engine wear, component degradation, and inorganic fuel additives. In the transportation sector, particulates are emitted mainly from diesel engines.

Passenger-miles traveled (PMT) - One person traveling the distance of one mile. Total passengermiles traveled, thus, give the total mileage traveled by all persons.

Passenger rail - See Rail, "Amtrak" and "Transit Railroad".

Personal Consumption Expenditures (PCE) - As used in the national accounts, the market value of purchases of goods and services by individuals and nonprofit institutions and the value of food, clothing, housing, and financial services received by them as income in kind. It includes the rental value of owner-occupied houses but excludes purchases of dwellings, which are classified as capital goods (investment).

Personal income - See Income.

Petroleum - A generic term applied to oil and oil products in all forms, such as crude oil, lease condensate, unfinished oil, refined petroleum products, natural gas plant liquids, and nonhydrocarbon compounds blended into finished petroleum products.

Petroleum consumption - A calculated demand for petroleum products obtained by summing domestic production, imports of crude petroleum and natural gas liquids, imports of petroleum products, and the primary stocks at the beginning of the period and then subtracting the exports and the primary stocks at the end of the period.

Petroleum exports - Shipments of petroleum products from the 50 States and the District of Columbia to foreign countries, Puerto Rico, the Virgin Islands, and other U.S. possessions and territories.

Petroleum imports - All imports of crude petroleum, natural gas liquids, and petroleum products from foreign countries and receipts from Guam, Puerto Rico, the Virgin Islands, and the Hawaiian Trade Zone. The commodities included are crude oil, unfinished oils, plant condensate, and refined petroleum products.

Petroleum inventories - The amounts of crude oil, unfinished oil, petroleum products, and natural gas liquids held at refineries, at natural gas processing plants, in pipelines, at bulk terminals operated by refining and pipeline companies, and at independent bulk terminals. Crude oil held in storage on leases is also included; these stocks are know as primary stocks. Secondary stocks - those held by jobbers dealers, service station operators, and consumers -are excluded. Prior to 1975, stock held at independent bulk terminals were classified as secondary stocks.

Petroleum products supplied - For each petroleum product, the amount supplied is calculated by summing production, crude oil burned directly, imports, and net withdrawals from primary stocks and subtracting exports.

Quad - Quadrillion, $10^{15}$. In this publication, a Quad refers to Quadrillion Btu.

## Rail -

Amtrak (American Railroad Tracks): Operated by the National Railroad Passenger Corporation of Washington, DC. This rail system was created by President Nixon in 1970, and was given the responsibility for the operation of intercity, as distinct from suburban, passenger trains between points designated by the Secretary of Transportation.

Class I freight railroad: Defined by the Interstate Commerce Commission each year based on annual operating revenue. A railroad is dropped from the Class I list if it fails to meet the annual earnings threshold for three consecutive years.

Commuter railroad: Those portions of mainline railroad (not electric railway) transportation operations which encompass urban passenger train service for local travel between a central city and adjacent suburbs. Commuter railroad service - using both locomotive-hauled and selfpropelled railroad passenger cars - is characterized by multi-trip tickets, specific station-tostation fares, and usually only one or two stations in the central business district. Also known as suburban railroad.

Transit railroad: Includes "heavy" and "light" transit rail. Heavy transit rail is characterized by exclusive rights-of-way, multi-car trains, high speed rapid acceleration, sophisticated signaling, and high platform loading. Also known as subway, elevated railway, or metropolitan railway (metro). Light transit rail may be on exclusive or shared rights-of-way, high or low platform loading, multi-car trains or single cars, automated or manually operated. In generic usage, light rail includes streetcars, trolley cars, and tramways.

Residential and Commercial sector - Consists of housing units, non-manufacturing business establishments (e.g., wholesale and retail businesses), health and educational institutions, and government offices.

Residential Transportation Energy Consumption Survey (RTECS) - This survey was designed by the Energy Information Administration of the Department of Energy to provide information on how energy is used by households for personal vehicles. It has been conducted five times since 1979, the most recent being 1991.

Residual fuel oil - The heavier oils that remain after the distillate fuel oils and lighter hydrocarbons are boiled off in refinery operations. Included are products know as ASTM grade numbers 5 and 6 oil, heavy diesel oil, Navy Special Fuel Oil, Bunker C oil, and acid sludge and pitch used as refinery fuels. Residual fuel oil is used for the production of electric power, for heating, and for various industrial purposes.

Rural - Usually refers to areas with population less than 5,000.

Sales-weighted miles per gallon (mpg) - Calculation of a composite vehicle fuel economy based on the distribution of vehicle sales.

Scrappage rate - As applied to motor vehicles, it is usually expressed as the percentage of vehicles of a certain type in a given age class that are retired from use (lacking registration) in a given year.

School and other nonrevenue bus - See Bus.

Single unit truck - Includes two-axle, four-tire trucks and other single unit trucks.

Two-axle, four tire truck: A motor vehicle consisting primarily of a single motorized device with two axles and four tires.

Other single-unit truck: A motor vehicle consisting primarily of a single motorized device with more than two axles or more than four tires.

Special fuels - Consist primarily of diesel fuel with small amount of liquified petroleum gas, as defined by the Federal Highway Administration.

Specific acceleration power - Measured in watts per kilogram. Acceleration power divided by the battery system weight. Weight must include the total battery system.

Specific energy - Measured in watt hours per kilogram. The rated energy capacity of the battery divided by the total battery system weight.

Subcompact car - See Automobile size classifications .

Supplemental air carrier - See Air carrier .

Ton-mile - The movement of one ton of freight the distance of one mile. Ton-miles are computed by multiplying the weight in tons of each shipment transported by the distance hauled.

## Transmission types -

A3 - Automatic three speed
A4 - Automatic four speed
A5 - Automatic five speed
L4 - Automatic lockup four speed
M5 - Manual five speed

Transit bus - See Bus.

Transit railroad - See Rail.

Transportation sector - Consists of both private and public passenger and freight transportation, as well as government transportation, including military operations.

Truck Inventory and Use Survey (TIUS) - Survey designed to collect data on the characteristics and operational use of the nation's truck population. It is conducted every five years by the U.S. Bureau of the Census. Surveys were conducted in 1963, 1967, 1972, 1977, 1982, 1987, and 1992. The 1992 data have not yet been released.

Trolley coach - See Bus.

Truck size classifications - U.S. Bureau of the Census has categorized trucks by gross vehicle weight (gvw) as follows:

> Light - Less than 10,000 pounds gvw (Also see Light Truck.)
> Medium - 10,001 to 20,000 pounds gvw
> Light-heavy - 20,001 to 26,000 pounds gvw
> Heavy-heavy - 26,001 pounds gvw or more.

Two-axle, four-tire truck - See Single-unit truck.

Two seater car - See Automobile size classifications .

Ultra-low emission vehicle - A clean fuel vehicle meeting the more stringent Ultra-low emission standards.

Urban - Usually refers to areas with population of 5,000 or greater.

Variable operating cost - See Operating cost.

Vehicle-miles traveled (vmt) - One vehicle traveling the distance of one mile. Total vehicle miles, thus, is the total mileage traveled by all vehicles.

Zero-emission vehicle - A clean fuel vehicle meeting even more stringent zero-emission vehicle standards.

Comparison of Station Prices: Compressed Natural Gas and Regular Unleade d Gasoline* (5-18)
Consortium
U.S. Advanced Battery Consortium Research Agreements* (5-11)

Advanced Battery Technology Goals of the U.S. Advanced Batter y Consortium* (5-12)
Consumption
Consumption of Total Energy by End-Use Sector, 1970-95* (2-10)
Domestic Consumption of Transportation Energy by Mode and Fuel Type, 1994 * (2-11)
Transportation Energy Consumption by Mode, 1970-94* (2-13)
United States Petroleum Production and Consumption, 1973-95* (2-3)
Personal Consumption Expenditures as Related to Transportation, 1970-94* (2-36)

Consumption of Petroleum by End-Use Sector, 1973-95* (2-7)
Natural Gas Consumption in the United States, 1970-94* (2-8)
Distribution of Energy Consumption by Source, 1973 and 1995* (2-9)
Alternative Vehicle Fuel Consumption, 1992-93* (2-9)
Average Material Consumption for a Domestic Automobile, 1978, 1985, and 1995* (3-14)
Gasohol Consumption by Reporting States, 1980-94* (5-17)
U.S. Carbon Dioxide Emissions from Fossil Energy Consumption by End-Use Sector, 1985-94* (7-9)
Control
Federal Emission Control Requirements for Automobiles and Light Trucks, 1976-95* (7-11)
Federal Emission Control Requirements for Heavy-Duty Gasoline Trucks, 1976-95* (7-12)
Federal Emission Control Requirements for Heavy-Duty Diesel Trucks, 1976-95* (7-12)
Corporate
Corporate Average Fuel Economy Standards versus Sales-Weighted Fuel Econom y Estimates for Automobiles and Light Trucks, 1978-95* (3-43)
Corporate Average Fuel Economy Fines Collected, 1983-94* (3-44)
Corporation
Summary Statistics for the National Railroad Passenger Corporation (Amtrak), 1971-94* (6-13)
Cost
Operating and Cost Data for Large Domestic Federal Fleets, 1986-94* (3-37)
Costs
Automobile Operating Costs, 1975-95* (2-39)
Countries
Fuel Economy of the Gasoline Personal Vehicle Population for Selected Countries , 1970-93* (1-10)
Fuel Economy Gap for Selected Countries* (1-11)
Annual Vehicle Miles per Vehicle Traveled by Personal Vehicles for Selected Countries, 1970-93* (1-12)
Passenger Travel by Personal Vehicles for Selected Countries, 1970-93* (1-13)
Energy Use by Personal Vehicles for Selected Countries, 1970-93* (1-14)
Freight Energy Use for Selected Countries by Mode, 1970-93* (1-15)
Vehicle Travel per Automobile for Selected Countries by Trip Purpose* (1-16)
Travel per Automobile Passenger for Selected Countries by Trip Purpose* (1-17)
Automobile Registrations for Selected Countries, 1950-95* (1-2)
Truck and Bus Registrations for Selected Countries, 1950-94* (1-3)
Gasoline Prices for Selected Countries, 1978-94* (1-5)
Diesel Fuel Prices for Selected Countries, 1978-94* (1-7)
New Gasoline Personal Vehicle Fuel Economy for Selected Countries, 1973-93* (1-9)

## Country

Imported Crude Oil and Petroleum Products by Country of Origin, 1990-95* (2-5)
World Crude Oil Production by Country of Origin, 1980-94* (2-6)
Coverage
Summary of EPACT Section 501 Coverage by Industry, 1994* (5-10)
Crude
Refinery Yield of Petroleum Products from a Barrel of Crude Oil, 1978-95* (2-2)
Prices for a Barrel of Crude Oil and a Gallon of Gasoline, 1978-95* (2-34)
Crude
Imported Crude Oil and Petroleum Products by Country of Origin, 1990-95* (2-5)
World Crude Oil Production by Country of Origin, 1980-94* (2-6)
Curb
Sales-Weighted Curb Weight of New Domestic and Import Automobiles by Size Class,
Sales Periods 1976-94* (3-16)
Daily
Average Annual/Daily Vehicle Miles of Travel for Fleet Vehicles* (3-38)
Natural Gas Supplier Fleet Vehicle Daily Miles Traveled Range, 1993* (5-9)
Diesel
Diesel Fuel Prices for Selected Countries, 1978-94* (1-7)
Number of Gasoline and Diesel Vehicles in Private Company Fleets in Atlanta by
Vehicle Type and Selected Characteristics* (3-40)
Number of Diesel Vehicles in Private Company Fleets in Atlanta by Vehicle Type and Selected Characteristics* (3-42)
Federal Emission Control Requirements for Heavy-Duty Diesel Trucks, 1976-95* (7-12)
Dioxide
U.S. Carbon Dioxide Emissions from Energy Use in the Transportation Sector, 1980-94* (7-10)
U.S. Carbon Dioxide Emissions from Fossil Energy Consumption by End-Use Sector, 1985-94* (7-9)
Distribution
Distribution of Energy Consumption by Source, 1973 and 1995* (2-9)
Distribution of Vehicles by Vehicle Age and Household Vehicle Ownership, 1991
RTECS* (4-7)
Domestic
Domestic Consumption of Transportation Energy by Mode and Fuel Type, 1994 * (2-11)
Average Material Consumption for a Domestic Automobile, 1978, 1985, and 1995* (3-14)
Sales-Weighted Engine Size of New Domestic and Import Automobiles by Size Class, Sales Periods 1976-94* (3-15)
Sales-Weighted Curb Weight of New Domestic and Import Automobiles by Size Class, Sales Periods 1976-94* (3-16)

Sales-Weighted Interior Space of New Domestic and Import Automobiles by Siz e Class, Sales Periods 1976-94* (3-17)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Automobiles, Selected Sales Periods 1976-94* (3-19)
Sales-Weighted Engine Size of New Domestic and Import Light Trucks by Size Class, Sales Periods 1976-94* (3-23)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Light Trucks, Selected Sales Periods 1976-94* (3-24)
Operating and Cost Data for Large Domestic Federal Fleets, 1986-94* (3-37)
Summary Statistics for Domestic and International Certificated Route Air Carriers, 1970-94* (6-3)
Tonnage Statistics for Domestic and International Waterborne Commerce, 1970-94* (6-5)
Summary Statistics for Domestic Waterborne Commerce, 1970-94* (6-6)
Breakdown of Domestic Marine Cargo by Commodity Class, 1993* (6-7)
Breakdown of Domestic Marine Cargo by Commodity Class, 1994* (6-8)
Duty
Energy Policy Act Purchase Requirements of Light-Duty Alternative Fuel Vehicles * (5-5)
Federal Emission Control Requirements for Heavy-Duty Gasoline Trucks, 1976-95* (7-12)
Federal Emission Control Requirements for Heavy-Duty Diesel Trucks, 1976-95* (7-12)
Economies
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Automobiles, Selected Sales Periods 1976-94* (3-19)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Light Trucks, Selected Sales Periods 1976-94* (3-24)
Alternative Fuel Vehicle Fuel Economies by Vehicle Type* (5-14)
Economy
Fuel Economy of the Gasoline Personal Vehicle Population for Selected Countries , 1970-93* (1-10)
Fuel Economy Gap for Selected Countries* (1-11)
New Gasoline Personal Vehicle Fuel Economy for Selected Countries, 1973-93* (1-9)
Truck Fuel Economy by Size Class, 1977, 1982, 1987, and 1992* (3-28)
Corporate Average Fuel Economy Standards versus Sales-Weighted Fuel Econom y Estimates for Automobiles and Light Trucks, 1978-95* (3-43)
Corporate Average Fuel Economy Fines Collected, 1983-94* (3-44)
Fuel Economy by Speed, 1973, 1984, and 1996* (3-47)
Fuel Economy by Speed for Selected Vehicles, 1996* (3-49)
Electric
Fleet Vehicles Operated by Electric Utilities* (5-7)

## Emission

Federal Emission Control Requirements for Automobiles and Light Trucks, 1976-95* (7-11)
Federal Emission Control Requirements for Heavy-Duty Gasoline Trucks, 1976-95* (7-12)
Federal Emission Control Requirements for Heavy-Duty Diesel Trucks, 1976-95* (7-12)
Exhaust Emission Standards for Clean-Fuel Vehicles in the California Pilot Test Program* (7-13)
California Air Resources Board Proposal for Meeting Emission Standards* (7-14)
National Lead Emission Estimates, 1970-94* (7-8)
Emissions
U.S. Carbon Dioxide Emissions from Energy Use in the Transportation Sector, 1980-94* (7-10)
Total National Emissions by Sector, 1994* (7-2)
Total National Emissions of Carbon Monoxide, 1940-94* (7-3)
Total National Emissions of Nitrogen Oxides, 1940-94* (7-4)
Emissions of Nitrogen Oxides from Highway Vehicles, 1970-94* (7-5)
Total National Emissions of Volatile Organic Compounds, 1940-94* (7-6)
Total National Emissions of Particulate Matter (PM-10), 1940-94* (7-7)
Estimated U.S. Emissions of Greenhouse Gases, 1993* (7-9)
U.S. Carbon Dioxide Emissions from Fossil Energy Consumption by End-Use Sector, 1985-94* (7-9)
Employees
Employees of Motor Vehicle and Related Industries, 1990 and 1992* (2-41)
Employment
Motor Vehicle Manufacturing Employment Statistics, 1972-94* (2-40)

## Energy

Energy Use by Personal Vehicles for Selected Countries, 1970-93* (1-14)
Freight Energy Use for Selected Countries by Mode, 1970-93* (1-15)
Consumption of Total Energy by End-Use Sector, 1970-95* (2-10)
Domestic Consumption of Transportation Energy by Mode and Fuel Type, 1994 * (2-11)
Transportation Energy Use by Mode, 1993-94* (2-12)
Transportation Energy Consumption by Mode, 1970-94* (2-13)
Passenger Travel and Energy Use in the United States, 1994* (2-15)
Intercity Freight Movement and Energy Use in the United States, 1994* (2-16)
Energy Intensities of Passenger Modes, 1970-94* (2-17)
Energy Intensities of Freight Modes, 1970-94* (2-18)
Changes in Transportation Energy Use, 1972-94* (2-20)
Changes in Passenger Transportation Energy Use, 1972-94* (2-22)
Changes in Highway Passenger Transportation Energy Use, 1972-94* (2-24)
Changes in Air Passenger Transportation Energy Use, 1972-94* (2-26)

Changes in Freight Transportation Energy Use, 1972-94* (2-28)
Changes in Rail Freight Transportation Energy Use, 1972-94* (2-30)
Distribution of Energy Consumption by Source, 1973 and 1995* (2-9)
Highway Energy Use by Mode, 1970-94* (3-2)
Energy Policy Act Purchase Requirements of Light-Duty Alternative Fuel Vehicles * (5-5)
Nonhighway Energy Use by Mode, 1970-94* (6-2)
U.S. Carbon Dioxide Emissions from Energy Use in the Transportation Sector, 1980-94* (7-10)
U.S. Carbon Dioxide Emissions from Fossil Energy Consumption by End-Use Sector, 1985-94* (7-9)

## Engine

Sales-Weighted Engine Size of New Domestic and Import Automobiles by Size Class, Sales Periods 1976-94* (3-15)
Sales-Weighted Engine Size of New Domestic and Import Light Trucks by Size Class, Sales Periods 1976-94* (3-23)

## EPACT

Summary of EPACT Section 501 Coverage by Industry, 1994* (5-10)
Estimated
Estimated U.S. Emissions of Greenhouse Gases, 1993* (7-9)
Estimates
Corporate Average Fuel Economy Standards versus Sales-Weighted Fuel Econom y Estimates for Automobiles and Light Trucks, 1978-95* (3-43)
Estimates of Non-Federal Alternative Fuel Vehicles by Ownership and Vehicle Size, 1993 and 1995* (5-3)
National Lead Emission Estimates, 1970-94* (7-8)
Ethanol
U.S. Production of MTBE and Fuel Ethanol, 1978-95* (5-16)

States with Ethanol Tax Incentives* (5-21)
Federal Excise Tax Exemption for Ethanol-Blended Fuels* (5-21)
Excise
Federal Excise Tax Exemption for Ethanol-Blended Fuels* (5-21)
Exemption
Federal Excise Tax Exemption for Ethanol-Blended Fuels* (5-21)
Exemptions
State Tax Exemptions for Gasohol* (5-20)
Exhaust
Exhaust Emission Standards for Clean-Fuel Vehicles in the California Pilot Test Program* (7-13)
Expenditures
Personal Consumption Expenditures as Related to Transportation, 1970-94* (2-36)
Average Annual Expenditures of Households by Income, 1994* (4-3)

Facility
Percentage of Trucks by Fleet Size and Primary Refueling Facility, 1992* (3-29)
Percentage of Trucks by Major Use and Primary Refueling Facility, 1992* (3-31)
Federal
Federal Government Vehicles by Agency, Fiscal Year 1993* (3-35)
Federal Government Vehicles by Agency, Fiscal Year 1994* (3-36)
Operating and Cost Data for Large Domestic Federal Fleets, 1986-94* (3-37)
Federal and State Taxes on Motor Fuels, 1994* (5-19)
Federal Excise Tax Exemption for Ethanol-Blended Fuels* (5-21)
Estimates of Non-Federal Alternative Fuel Vehicles by Ownership and Vehicle Size, 1993 and 1995* (5-3)
Federal Government Alternative Fuel Vehicles by Fuel Type, 1992, 1993, and 1995* (5-4)
Federal Emission Control Requirements for Automobiles and Light Trucks, 1976-95* (7-11)
Federal Emission Control Requirements for Heavy-Duty Gasoline Trucks, 1976-95* (7-12)
Federal Emission Control Requirements for Heavy-Duty Diesel Trucks, 1976-95* (7-12)
Fines
Corporate Average Fuel Economy Fines Collected, 1983-94* (3-44)
Fiscal
Federal Government Vehicles by Agency, Fiscal Year 1993* (3-35)
Federal Government Vehicles by Agency, Fiscal Year 1994* (3-36)
Fleet
Percentage of Trucks by Fleet Size and Primary Refueling Facility, 1992* (3-29)
Fleet Vehicle Composition by Vehicle Type* (3-38)
Average Length of Time Fleet Vehicles are Kept Before Sold to Others* (3-38)
Average Annual/Daily Vehicle Miles of Travel for Fleet Vehicles* (3-38)
Fleet Vehicles Operated by Propane Providers* (5-6)
Fleet Vehicles Operated by Electric Utilities* (5-7)
Fleet Vehicles Operated by Natural Gas Suppliers* (5-8)
Natural Gas Supplier Fleet Vehicle Daily Miles Traveled Range, 1993* (5-9)
Fleets
Automobile Fleets by Use, 1982-94* (3-34)
Operating and Cost Data for Large Domestic Federal Fleets, 1986-94* (3-37)
Number of Gasoline and Diesel Vehicles in Private Company Fleets in Atlanta by Vehicle Type and Selected Characteristics* (3-40)
Number of Gasoline Vehicles in Private Company Fleets in Atlanta by Vehicle Type and Selected Characteristics* (3-41)
Number of Diesel Vehicles in Private Company Fleets in Atlanta by Vehicle Type and Selected Characteristics* (3-42)

Fossil
U.S. Carbon Dioxide Emissions from Fossil Energy Consumption by End-Use Sector, 1985-94* (7-9)
Freight
Freight Energy Use for Selected Countries by Mode, 1970-93* (1-15)
Intercity Freight Movement and Energy Use in the United States, 1994* (2-16)
Energy Intensities of Freight Modes, 1970-94* (2-18)
Changes in Freight Transportation Energy Use, 1972-94* (2-28)
Changes in Rail Freight Transportation Energy Use, 1972-94* (2-30)
Summary Statistics for Class I Freight Railroads, 1970-94* (6-10)
Class I Railroad Freight Systems in the United States Ranked by Revenue Ton-Miles, 1994* (6-9)
Fuel
Fuel Economy of the Gasoline Personal Vehicle Population for Selected Countries , 1970-93* (1-10)
Fuel Economy Gap for Selected Countries* (1-11)
Diesel Fuel Prices for Selected Countries, 1978-94* (1-7)
New Gasoline Personal Vehicle Fuel Economy for Selected Countries, 1973-93* (1-9)
Domestic Consumption of Transportation Energy by Mode and Fuel Type, 1994 * (2-11)
Retail Prices for Motor Fuel, 1978-95* (2-32)
Alternative Vehicle Fuel Consumption, 1992-93* (2-9)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Automobiles, Selected Sales Periods 1976-94* (3-19)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Light Trucks, Selected Sales Periods 1976-94* (3-24)
Truck Fuel Economy by Size Class, 1977, 1982, 1987, and 1992* (3-28)
Corporate Average Fuel Economy Standards versus Sales-Weighted Fuel Econom y
Estimates for Automobiles and Light Trucks, 1978-95* (3-43)
Corporate Average Fuel Economy Fines Collected, 1983-94* (3-44)
Fuel Economy by Speed, 1973, 1984, and 1996* (3-47)
Fuel Economy by Speed for Selected Vehicles, 1996* (3-49)
Alternative Fuel Vehicles Available by Manufacturer* (5-13)
Alternative Fuel Vehicle Fuel Economies by Vehicle Type* (5-14)
Number of Alternative Refuel Sites by State and Fuel Type, 1995* (5-15)
U.S. Production of MTBE and Fuel Ethanol, 1978-95* (5-16)

Estimates of Non-Federal Alternative Fuel Vehicles by Ownership and Vehicle Size, 1993 and 1995* (5-3)
Federal Government Alternative Fuel Vehicles by Fuel Type, 1992, 1993, and 1995* (5-4)
Energy Policy Act Purchase Requirements of Light-Duty Alternative Fuel Vehicles * (5-5)

Exhaust Emission Standards for Clean-Fuel Vehicles in the California Pilot Test Program* (7-13)
Possible Fuel/Vehicles for Clean-Fuel Vehicles* (7-15)
Fuels
Highway Usage of Gasoline and Special Fuels, 1973-94* (2-14)
Prices for Selected Transportation Fuels, 1978-95* (2-33)
Federal and Sate Taxes on Motor Fuels, 1994* (5-19)
Federal Excise Tax Exemption for Ethanol-Blended Fuels* (5-21)
Gallon
Prices for a Barrel of Crude Oil and a Gallon of Gasoline, 1978-95* (2-34)
Gap
Fuel Economy Gap for Selected Countries* (1-11)
Gas
Natural Gas Consumption in the United States, 1970-94* (2-8)
Tax Receipts from the Sale of Gas Guzzlers, 1980-93* (3-44)
The Gas Guzzler Tax on New Cars* (3-45)
Comparison of Station Prices: Compressed Natural Gas and Regular Unleade d Gasoline* (5-18)
Fleet Vehicles Operated by Natural Gas Suppliers* (5-8)
Natural Gas Supplier Fleet Vehicle Daily Miles Traveled Range, 1993* (5-9)
Gases
Estimated U.S. Emissions of Greenhouse Gases, 1993* (7-9)
Gasohol
Gasohol Consumption by Reporting States, 1980-94* (5-17)
State Tax Exemptions for Gasohol* (5-20)
Gasoline
Fuel Economy of the Gasoline Personal Vehicle Population for Selected Countries , 1970-93* (1-10)
Gasoline Prices for Selected Countries, 1978-94* (1-5)
New Gasoline Personal Vehicle Fuel Economy for Selected Countries, 1973-93* (1-9)
Highway Usage of Gasoline and Special Fuels, 1973-94* (2-14)
Prices for a Barrel of Crude Oil and a Gallon of Gasoline, 1978-95* (2-34)
Number of Gasoline and Diesel Vehicles in Private Company Fleets in Atlanta by
Vehicle Type and Selected Characteristics* (3-40)
Number of Gasoline Vehicles in Private Company Fleets in Atlanta by Vehicle Type and
Selected Characteristics* (3-41)
Comparison of Station Prices: Compressed Natural Gas and Regular Unleade d Gasoline* (5-18)
Federal Emission Control Requirements for Heavy-Duty Gasoline Trucks, 1976-95* (7-12)
Goals
Advanced Battery Technology Goals of the U.S. Advanced Batter y Consortium* (5-12)

## Government

Federal Government Vehicles by Agency, Fiscal Year 1993* (3-35)
Federal Government Vehicles by Agency, Fiscal Year 1994* (3-36)
Federal Government Alternative Fuel Vehicles by Fuel Type, 1992, 1993, and 1995* (5-4)
Greenhouse
Estimated U.S. Emissions of Greenhouse Gases, 1993* (7-9)
Gross
Gross National Product as Related to Transportation, 1970-94* (2-35)
New Retail Truck Sales by Gross Vehicle Weight, 1970-94* (3-21)
Truck Statistics by Gross Vehicle Weight Class, 1992* (3-29)

## Guzzler

The Gas Guzzler Tax on New Cars* (3-45)

## Guzzlers

Tax Receipts from the Sale of Gas Guzzlers, 1980-93* (3-44)
GVW
New Retail Sales of Trucks 10,000 pounds GVW and less in the United States, 1970-94* (3-20)
Heavy
Federal Emission Control Requirements for Heavy-Duty Gasoline Trucks, 1976-95* (7-12)
Federal Emission Control Requirements for Heavy-Duty Diesel Trucks, 1976-95* (7-12)
Highway
Highway Usage of Gasoline and Special Fuels, 1973-94* (2-14)
Changes in Highway Passenger Transportation Energy Use, 1972-94* (2-24)
Highway Energy Use by Mode, 1970-94* (3-2)
Highway Vehicle Miles Traveled by Mode, 1970-94* (3-3)
Emissions of Nitrogen Oxides from Highway Vehicles, 1970-94* (7-5)
Household
Annual Vehicle Trips by Number of Household-based Vehicles and Age of Vehicle, 1990 NPTS* (4-10)
Average Number of Vehicles and Vehicle Travel per Household, 1991 and 1994 RTECS* (4-4)
Statistics for Household Vehicles by Vehicle Type, 1985, 1988, 1991 and 1994 RTECS* (4-5)
Average Annual Miles per Vehicle by Household Vehicle Ownership, 1991 RTECS* (4-6)
Average Age of Vehicles by Household Vehicle Ownership, 1991 RTECS* (4-6)
Distribution of Vehicles by Vehicle Age and Household Vehicle Ownership, 1991
RTECS* (4-7)
Household Vehicle Ownership, 1960-90 Census* (4-8)
Average Annual Vehicle Miles, Vehicle Trips and Trip Length per Household for Selected Trip Purposes, 1969, 1977, 1983 and 1990 NPTS* (4-9)

Households
Average Annual Expenditures of Households by Income, 1994* (4-3) Import

Sales-Weighted Engine Size of New Domestic and Import Automobiles by Size Class, Sales Periods 1976-94* (3-15)
Sales-Weighted Curb Weight of New Domestic and Import Automobiles by Size Class, Sales Periods 1976-94* (3-16)
Sales-Weighted Interior Space of New Domestic and Import Automobiles by Siz e Class, Sales Periods 1976-94* (3-17)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Automobiles, Selected Sales Periods
1976-94* (3-19)
Sales-Weighted Engine Size of New Domestic and Import Light Trucks by Size Class, Sales Periods 1976-94* (3-23)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Light Trucks, Selected Sales Periods 1976-94* (3-24)
Imported
Imported Crude Oil and Petroleum Products by Country of Origin, 1990-95* (2-5)
Incentives
States with Ethanol Tax Incentives* (5-21)
Income
Average Annual Expenditures of Households by Income, 1994* (4-3)
Indices
Statistical Indices as Related to Transportation, 1970-94* (2-37)
Industries
Employees of Motor Vehicle and Related Industries, 1990 and 1992* (2-41)
Industry
Summary of EPACT Section 501 Coverage by Industry, 1994* (5-10)
Intensities
Energy Intensities of Passenger Modes, 1970-94* (2-17)
Energy Intensities of Freight Modes, 1970-94* (2-18)
Intercity
Intercity Freight Movement and Energy Use in the United States, 1994* (2-16)
Interior
Sales-Weighted Interior Space of New Domestic and Import Automobiles by Siz e Class, Sales Periods 1976-94* (3-17)
Intermodal
Intermodal Rail Traffic, 1965-94* (6-12)
International
Summary Statistics for Domestic and International Certificated Route Air Carriers , 1970-94* (6-3)
Tonnage Statistics for Domestic and International Waterborne Commerce, 1970-94* (6-5)

Interstate
Average Urban and Rural Interstate Speeds, 1970-93* (3-51)
Journey
Number of Journey-to-Work Trips by Number of Occupants and Vehicle Type, 1990 NPTS* (4-13)
National and Metropolitan Area Comparisons of Journey-to-Work Statistics, 1990 Census* (4-15)
Lead
National Lead Emission Estimates, 1970-94* (7-8)
Length
Average Length of Time Fleet Vehicles are Kept Before Sold to Others* (3-38)
Average Annual Vehicle Miles, Vehicle Trips and Trip Length per Household for
Selected Trip Purposes, 1969, 1977, 1983 and 1990 NPTS* (4-9)
Light
Sales-Weighted Engine Size of New Domestic and Import Light Trucks by Size Class, Sales Periods 1976-94* (3-23)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Light Trucks, Selected Sales Periods 1976-94* (3-24)
Corporate Average Fuel Economy Standards versus Sales-Weighted Fuel Econom y Estimates for Automobiles and Light Trucks, 1978-95* (3-43)
Energy Policy Act Purchase Requirements of Light-Duty Alternative Fuel Vehicles * (5-5)
Federal Emission Control Requirements for Automobiles and Light Trucks, 1976-95* (7-11)
Manufacturer
Alternative Fuel Vehicles Available by Manufacturer* (5-13)
Manufacturing
Motor Vehicle Manufacturing Employment Statistics, 1972-94* (2-40)
Marine
Breakdown of Domestic Marine Cargo by Commodity Class, 1993* (6-7)
Breakdown of Domestic Marine Cargo by Commodity Class, 1994* (6-8)

## Market

Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Automobiles, Selected Sales Periods 1976-94* (3-19)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Light Trucks, Selected Sales Periods 1976-94* (3-24)
Material
Average Material Consumption for a Domestic Automobile, 1978, 1985, and 1995*
(3-14)
Matter
Total National Emissions of Particulate Matter (PM-10), 1940-94* (7-7)
Meeting
California Air Resources Board Proposal for Meeting Emission Standards* (7-14)

## Metropolitan

National and Metropolitan Area Comparisons of Journey-to-Work Statistics, 1990 Census* (4-15)
Miles
Annual Vehicle Miles per Vehicle Traveled by Personal Vehicles for Selected Countries, 1970-93* (1-12)
Average Annual Miles Per Automobile by Automobile Age* (3-13)
Highway Vehicle Miles Traveled by Mode, 1970-94* (3-3)
Average Annual/Daily Vehicle Miles of Travel for Fleet Vehicles* (3-38)
Average Annual Miles per Vehicle by Household Vehicle Ownership, 1991 RTECS* (4-6)
Average Annual Vehicle Miles, Vehicle Trips and Trip Length per Household for Selected Trip Purposes, 1969, 1977, 1983 and 1990 NPTS* (4-9)
Natural Gas Supplier Fleet Vehicle Daily Miles Traveled Range, 1993* (5-9)
Class I Railroad Freight Systems in the United States Ranked by Revenue Ton-Miles, 1994* (6-9)
Mode
Freight Energy Use for Selected Countries by Mode, 1970-93* (1-15)
Domestic Consumption of Transportation Energy by Mode and Fuel Type, 1994 * (2-11)
Transportation Energy Use by Mode, 1993-94* (2-12)
Transportation Energy Consumption by Mode, 1970-94* (2-13)
Highway Energy Use by Mode, 1970-94* (3-2)
Highway Vehicle Miles Traveled by Mode, 1970-94* (3-3)
Nonhighway Energy Use by Mode, 1970-94* (6-2)
Model
Scrappage and Survival Rates for Automobiles, 1970, 1980, and 1990 Model Years* (3-8)
Modes
Energy Intensities of Passenger Modes, 1970-94* (2-17)
Energy Intensities of Freight Modes, 1970-94* (2-18)
Monoxide
Total National Emissions of Carbon Monoxide, 1940-94* (7-3)
Motor
Retail Prices for Motor Fuel, 1978-95* (2-32)
Motor Vehicle Manufacturing Employment Statistics, 1972-94* (2-40)
Employees of Motor Vehicle and Related Industries, 1990 and 1992* (2-41)
Federal and Sate Taxes on Motor Fuels, 1994* (5-19)
Movement
Intercity Freight Movement and Energy Use in the United States, 1994* (2-16)
MTBE
U.S. Production of MTBE and Fuel Ethanol, 1978-95* (5-16)

National
Gross National Product as Related to Transportation, 1970-94* (2-35)
National and Metropolitan Area Comparisons of Journey-to-Work Statistics, 1990
Census* (4-15)
Summary Statistics for the National Railroad Passenger Corporation (Amtrak), 1971-94* (6-13)
Total National Emissions by Sector, 1994* (7-2)
Total National Emissions of Carbon Monoxide, 1940-94* (7-3)
Total National Emissions of Nitrogen Oxides, 1940-94* (7-4)
Total National Emissions of Volatile Organic Compounds, 1940-94* (7-6)
Total National Emissions of Particulate Matter (PM-10), 1940-94* (7-7)
National Lead Emission Estimates, 1970-94* (7-8)
Natural
Natural Gas Consumption in the United States, 1970-94* (2-8)
Comparison of Station Prices: Compressed Natural Gas and Regular Unleade d Gasoline* (5-18)
Fleet Vehicles Operated by Natural Gas Suppliers* (5-8)
Natural Gas Supplier Fleet Vehicle Daily Miles Traveled Range, 1993* (5-9)
Nitrogen
Total National Emissions of Nitrogen Oxides, 1940-94* (7-4)
Emissions of Nitrogen Oxides from Highway Vehicles, 1970-94* (7-5)
Non
Estimates of Non-Federal Alternative Fuel Vehicles by Ownership and Vehicle Size,
1993 and 1995* (5-3)
Nonhighway
Nonhighway Energy Use by Mode, 1970-94* (6-2)
NPTS
Annual Vehicle Trips by Number of Household-based Vehicles and Age of Vehicle, 1990 NPTS* (4-10)
Number of Journey-to-Work Trips by Number of Occupants and Vehicle Type, 1990 NPTS* (4-13)
Average Annual Vehicle Miles, Vehicle Trips and Trip Length per Household for
Selected Trip Purposes, 1969, 1977, 1983 and 1990 NPTS* (4-9)
Occupants
Number of Journey-to-Work Trips by Number of Occupants and Vehicle Type, 1990 NPTS* (4-13)
Oil
Refinery Yield of Petroleum Products from a Barrel of Crude Oil, 1978-95* (2-2)
Prices for a Barrel of Crude Oil and a Gallon of Gasoline, 1978-95* (2-34)
Imported Crude Oil and Petroleum Products by Country of Origin, 1990-95* (2-5)
World Crude Oil Production by Country of Origin, 1980-94* (2-6)

Operated
Fleet Vehicles Operated by Propane Providers* (5-6)
Fleet Vehicles Operated by Electric Utilities* (5-7)
Fleet Vehicles Operated by Natural Gas Suppliers* (5-8)
Operating
Automobile Operating Costs, 1975-95* (2-39)
Operating and Cost Data for Large Domestic Federal Fleets, 1986-94* (3-37) Operation

Automobiles in Operation and Vehicle Travel by Age, 1970 and 1994* (3-11)
Trucks in Operation and Vehicle Travel by Age of Vehicle, 1970 and 1994* (3-22)
Operations
Summary Statistics for Rail Transit Operations, 1970-94* (6-14)
Organic
Total National Emissions of Volatile Organic Compounds, 1940-94* (7-6) Origin

Imported Crude Oil and Petroleum Products by Country of Origin, 1990-95* (2-5)
World Crude Oil Production by Country of Origin, 1980-94* (2-6)
Others
Average Length of Time Fleet Vehicles are Kept Before Sold to Others* (3-38) Ownership

Average Annual Miles per Vehicle by Household Vehicle Ownership, 1991 RTECS* (4-6)
Average Age of Vehicles by Household Vehicle Ownership, 1991 RTECS* (4-6)
Distribution of Vehicles by Vehicle Age and Household Vehicle Ownership, 1991 RTECS* (4-7)
Household Vehicle Ownership, 1960-90 Census* (4-8)
Estimates of Non-Federal Alternative Fuel Vehicles by Ownership and Vehicle Size,
1993 and 1995* (5-3)
Oxides
Total National Emissions of Nitrogen Oxides, 1940-94* (7-4)
Emissions of Nitrogen Oxides from Highway Vehicles, 1970-94* (7-5)
Particulate
Total National Emissions of Particulate Matter (PM-10), 1940-94* (7-7)
Passenger
Passenger Travel by Personal Vehicles for Selected Countries, 1970-93* (1-13)
Travel per Automobile Passenger for Selected Countries by Trip Purpose* (1-17)
Passenger Travel and Energy Use in the United States, 1994* (2-15)
Energy Intensities of Passenger Modes, 1970-94* (2-17)
Changes in Passenger Transportation Energy Use, 1972-94* (2-22)
Changes in Highway Passenger Transportation Energy Use, 1972-94* (2-24)
Changes in Air Passenger Transportation Energy Use, 1972-94* (2-26)
Summary Statistics for Passenger Cars, 1970-94* (3-12)
Summary Statistics for the National Railroad Passenger Corporation (Amtrak), 1971-94* (6-13)

## Percentage

Percentage of Trucks by Size Class, 1977, 1982, 1987, and 1992* (3-28)
Percentage of Trucks by Fleet Size and Primary Refueling Facility, 1992* (3-29)
Percentage of Trucks by Major Use and Primary Refueling Facility, 1992* (3-31)
Percentage of Trucks by Size Ranked by Major Use, 1992* (3-32)
Periods
Sales-Weighted Engine Size of New Domestic and Import Automobiles by Size Class, Sales Periods 1976-94* (3-15)
Sales-Weighted Curb Weight of New Domestic and Import Automobiles by Size Class, Sales Periods 1976-94* (3-16)
Sales-Weighted Interior Space of New Domestic and Import Automobiles by Siz e Class, Sales Periods 1976-94* (3-17)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Automobiles, Selected Sales Periods 1976-94* (3-19)
Sales-Weighted Engine Size of New Domestic and Import Light Trucks by Size Class, Sales Periods 1976-94* (3-23)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Light Trucks, Selected Sales Periods 1976-94* (3-24)
Personal
Fuel Economy of the Gasoline Personal Vehicle Population for Selected Countries , 1970-93* (1-10)
Annual Vehicle Miles per Vehicle Traveled by Personal Vehicles for Selected Countries, 1970-93* (1-12)
Passenger Travel by Personal Vehicles for Selected Countries, 1970-93* (1-13)
Energy Use by Personal Vehicles for Selected Countries, 1970-93* (1-14)
New Gasoline Personal Vehicle Fuel Economy for Selected Countries, 1973-93* (1-9)
Personal Consumption Expenditures as Related to Transportation, 1970-94* (2-36)
Petroleum
Refinery Yield of Petroleum Products from a Barrel of Crude Oil, 1978-95* (2-2)
United States Petroleum Production and Consumption, 1973-95* (2-3)
Imported Crude Oil and Petroleum Products by Country of Origin, 1990-95* (2-5)
Consumption of Petroleum by End-Use Sector, 1973-95* (2-7)
Pilot
Exhaust Emission Standards for Clean-Fuel Vehicles in the California Pilot Test Program* (7-13)
PM
Total National Emissions of Particulate Matter (PM-10), 1940-94* (7-7)
Policy
Energy Policy Act Purchase Requirements of Light-Duty Alternative Fuel Vehicles * (5-5)

## Population

Fuel Economy of the Gasoline Personal Vehicle Population for Selected Countries , 1970-93* (1-10)
Population and Vehicle Profile, 1950-94* (4-2)
pounds
New Retail Sales of Trucks 10,000 pounds GVW and less in the United States, 1970-94* (3-20)
Price
Average Price of a New Car, 1970-94* (2-38)

## Prices

Gasoline Prices for Selected Countries, 1978-94* (1-5)
Diesel Fuel Prices for Selected Countries, 1978-94* (1-7)
Retail Prices for Motor Fuel, 1978-95* (2-32)
Prices for Selected Transportation Fuels, 1978-95* (2-33)
Prices for a Barrel of Crude Oil and a Gallon of Gasoline, 1978-95* (2-34)
Comparison of Station Prices: Compressed Natural Gas and Regular Unleade d Gasoline* (5-18)

## Primary

Percentage of Trucks by Fleet Size and Primary Refueling Facility, 1992* (3-29)
Percentage of Trucks by Major Use and Primary Refueling Facility, 1992* (3-31)
Private
Number of Gasoline and Diesel Vehicles in Private Company Fleets in Atlanta by
Vehicle Type and Selected Characteristics* (3-40)
Number of Gasoline Vehicles in Private Company Fleets in Atlanta by Vehicle Type and Selected Characteristics* (3-41)
Number of Diesel Vehicles in Private Company Fleets in Atlanta by Vehicle Type and
Selected Characteristics* (3-42)
Products
Refinery Yield of Petroleum Products from a Barrel of Crude Oil, 1978-95* (2-2)
Imported Crude Oil and Petroleum Products by Country of Origin, 1990-95* (2-5)
Profile
Population and Vehicle Profile, 1950-94* (4-2)
Propane
Fleet Vehicles Operated by Propane Providers* (5-6)
Proposal
California Air Resources Board Proposal for Meeting Emission Standards* (7-14)
Providers
Fleet Vehicles Operated by Propane Providers* (5-6)
Purchase
Energy Policy Act Purchase Requirements of Light-Duty Alternative Fuel Vehicles * (5-5)

## Purpose

Vehicle Travel per Automobile for Selected Countries by Trip Purpose* (1-16)
Travel per Automobile Passenger for Selected Countries by Trip Purpose* (1-17) Purposes

Average Annual Vehicle Miles, Vehicle Trips and Trip Length per Household for
Selected Trip Purposes, 1969, 1977, 1983 and 1990 NPTS* (4-9)
Rail
Changes in Rail Freight Transportation Energy Use, 1972-94* (2-30)
Intermodal Rail Traffic, 1965-94* (6-12)
Summary Statistics for Rail Transit Operations, 1970-94* (6-14)
Railroad
Railroad Revenue Carloadings by Commodity Group, 1974 and 1994* (6-11)
Summary Statistics for the National Railroad Passenger Corporation (Amtrak), 1971-94* (6-13)
Class I Railroad Freight Systems in the United States Ranked by Revenue Ton-Miles, 1994* (6-9)
Railroads
Summary Statistics for Class I Freight Railroads, 1970-94* (6-10)
Ranked
Percentage of Trucks by Size Ranked by Major Use, 1992* (3-32)
Class I Railroad Freight Systems in the United States Ranked by Revenue Ton-Miles, 1994* (6-9)
Rates
Scrappage and Survival Rates for Automobiles, 1970, 1980, and 1990 Model Years*
(3-8)
Scrappage and Survival Rates for Trucks* (3-9)
Receipts
Tax Receipts from the Sale of Gas Guzzlers, 1980-93* (3-44)
Refinery
Refinery Yield of Petroleum Products from a Barrel of Crude Oil, 1978-95* (2-2) Refuel

Number of Alternative Refuel Sites by State and Fuel Type, 1995* (5-15) Refueling

Percentage of Trucks by Fleet Size and Primary Refueling Facility, 1992* (3-29)
Percentage of Trucks by Major Use and Primary Refueling Facility, 1992* (3-31)
Registrations
Automobile Registrations for Selected Countries, 1950-95* (1-2)
Truck and Bus Registrations for Selected Countries, 1950-94* (1-3)
Regular
Comparison of Station Prices: Compressed Natural Gas and Regular Unleade d Gasoline* (5-18)
Reporting
Gasohol Consumption by Reporting States, 1980-94* (5-17)

Research
U.S. Advanced Battery Consortium Research Agreements* (5-11)

Resources
California Air Resources Board Proposal for Meeting Emission Standards* (7-14)
Retail
Retail Prices for Motor Fuel, 1978-95* (2-32)
New Retail Automobile Sales in the United States, 1970-94* (3-10)
New Retail Sales of Trucks 10,000 pounds GVW and less in the United States, 1970-94* (3-20)
New Retail Truck Sales by Gross Vehicle Weight, 1970-94* (3-21)
Revenue
Railroad Revenue Carloadings by Commodity Group, 1974 and 1994* (6-11)
Class I Railroad Freight Systems in the United States Ranked by Revenue Ton-Miles, 1994* (6-9)
Route
Summary Statistics for Domestic and International Certificated Route Air Carriers , 1970-94* (6-3)

## RTECS

Average Number of Vehicles and Vehicle Travel per Household, 1991 and 1994 RTECS* (4-4)
Statistics for Household Vehicles by Vehicle Type, 1985, 1988, 1991 and 1994 RTECS* (4-5)
Average Annual Miles per Vehicle by Household Vehicle Ownership, 1991 RTECS* (4-6)
Average Age of Vehicles by Household Vehicle Ownership, 1991 RTECS* (4-6)
Distribution of Vehicles by Vehicle Age and Household Vehicle Ownership, 1991
RTECS* (4-7)
Rural
Average Urban and Rural Interstate Speeds, 1970-93* (3-51)
Sale
Tax Receipts from the Sale of Gas Guzzlers, 1980-93* (3-44)
Sales
New Retail Automobile Sales in the United States, 1970-94* (3-10)
Sales-Weighted Engine Size of New Domestic and Import Automobiles by Size Class, Sales Periods 1976-94* (3-15)
Sales-Weighted Curb Weight of New Domestic and Import Automobiles by Size Class, Sales Periods 1976-94* (3-16)
Sales-Weighted Interior Space of New Domestic and Import Automobiles by Siz e Class, Sales Periods 1976-94* (3-17)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Automobiles, Selected Sales Periods 1976-94* (3-19)
New Retail Sales of Trucks 10,000 pounds GVW and less in the United States, 1970-94* (3-20)

New Retail Truck Sales by Gross Vehicle Weight, 1970-94* (3-21)
Sales-Weighted Engine Size of New Domestic and Import Light Trucks by Size Class, Sales Periods 1976-94* (3-23)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Light Trucks, Selected Sales Periods 1976-94* (3-24)
Vehicle Stock and New Sales in United States, 1994 Calendar Year* (3-4)
Corporate Average Fuel Economy Standards versus Sales-Weighted Fuel Econom y
Estimates for Automobiles and Light Trucks, 1978-95* (3-43)
Scrappage
Scrappage and Survival Rates for Automobiles, 1970, 1980, and 1990 Model Years*
(3-8)
Scrappage and Survival Rates for Trucks* (3-9)
Sector
Consumption of Total Energy by End-Use Sector, 1970-95* (2-10)
Consumption of Petroleum by End-Use Sector, 1973-95* (2-7)
U.S. Carbon Dioxide Emissions from Energy Use in the Transportation Sector, 1980-94* (7-10)
Total National Emissions by Sector, 1994* (7-2)
U.S. Carbon Dioxide Emissions from Fossil Energy Consumption by End-Use Sector, 1985-94* (7-9)
Selected
Fuel Economy of the Gasoline Personal Vehicle Population for Selected Countries , 1970-93* (1-10)
Fuel Economy Gap for Selected Countries* (1-11)
Annual Vehicle Miles per Vehicle Traveled by Personal Vehicles for Selected Countries, 1970-93* (1-12)
Passenger Travel by Personal Vehicles for Selected Countries, 1970-93* (1-13)
Energy Use by Personal Vehicles for Selected Countries, 1970-93* (1-14)
Freight Energy Use for Selected Countries by Mode, 1970-93* (1-15)
Vehicle Travel per Automobile for Selected Countries by Trip Purpose* (1-16)
Travel per Automobile Passenger for Selected Countries by Trip Purpose* (1-17)
Automobile Registrations for Selected Countries, 1950-95* (1-2)
Truck and Bus Registrations for Selected Countries, 1950-94* (1-3)
Gasoline Prices for Selected Countries, 1978-94* (1-5)
Diesel Fuel Prices for Selected Countries, 1978-94* (1-7)
New Gasoline Personal Vehicle Fuel Economy for Selected Countries, 1973-93* (1-9)
Prices for Selected Transportation Fuels, 1978-95* (2-33)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Automobiles, Selected Sales Periods 1976-94* (3-19)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Light Trucks, Selected Sales Periods 1976-94* (3-24)
Number of Gasoline and Diesel Vehicles in Private Company Fleets in Atlanta by Vehicle Type and Selected Characteristics* (3-40)

Number of Gasoline Vehicles in Private Company Fleets in Atlanta by Vehicle Type and Selected Characteristics* (3-41)
Number of Diesel Vehicles in Private Company Fleets in Atlanta by Vehicle Type and Selected Characteristics* (3-42)
Fuel Economy by Speed for Selected Vehicles, 1996* (3-49)
Average Annual Vehicle Miles, Vehicle Trips and Trip Length per Household for Selected Trip Purposes, 1969, 1977, 1983 and 1990 NPTS* (4-9) Shares

Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Automobiles, Selected Sales Periods 1976-94* (3-19)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Light Trucks, Selected Sales Periods 1976-94* (3-24)
Single
Summary Statistics for Other Single-Unit and Combination Trucks, 1970-94* (3-26) Sites

Number of Alternative Refuel Sites by State and Fuel Type, 1995* (5-15) Sold

Average Length of Time Fleet Vehicles are Kept Before Sold to Others* (3-38)
Source
Distribution of Energy Consumption by Source, 1973 and 1995* (2-9) Space

Sales-Weighted Interior Space of New Domestic and Import Automobiles by Siz e Class, Sales Periods 1976-94* (3-17)
Speed
Fuel Economy by Speed, 1973, 1984, and 1996* (3-47)
Fuel Economy by Speed for Selected Vehicles, 1996* (3-49)
Speeds
Average Urban and Rural Interstate Speeds, 1970-93* (3-51)
Standards
Corporate Average Fuel Economy Standards versus Sales-Weighted Fuel Econom y Estimates for Automobiles and Light Trucks, 1978-95* (3-43)
Exhaust Emission Standards for Clean-Fuel Vehicles in the California Pilot Test Program* (7-13)
California Air Resources Board Proposal for Meeting Emission Standards* (7-14)
Station
Comparison of Station Prices: Compressed Natural Gas and Regular Unleade d Gasoline* (5-18)
Statistical
Statistical Indices as Related to Transportation, 1970-94* (2-37)
Statistics
Motor Vehicle Manufacturing Employment Statistics, 1972-94* (2-40)
Summary Statistics for Passenger Cars, 1970-94* (3-12)
Summary Statistics for Two-Axle, Four-Tire Trucks, 1970-94* (3-25)

Summary Statistics for Other Single-Unit and Combination Trucks, 1970-94* (3-26)
Truck Statistics by Gross Vehicle Weight Class, 1992* (3-29)
Truck Statistics by Size, 1992* (3-30)
Summary Statistics on Buses by Type, 1970-94* (3-33)
National and Metropolitan Area Comparisons of Journey-to-Work Statistics, 1990 Census* (4-15)
Statistics for Household Vehicles by Vehicle Type, 1985, 1988, 1991 and 1994 RTECS* (4-5)
Summary Statistics for Class I Freight Railroads, 1970-94* (6-10)
Summary Statistics for the National Railroad Passenger Corporation (Amtrak), 1971-94* (6-13)
Summary Statistics for Rail Transit Operations, 1970-94* (6-14)
Summary Statistics for Domestic and International Certificated Route Air Carriers , 1970-94* (6-3)
Summary Statistics for General Aviation, 1970-94* (6-4)
Tonnage Statistics for Domestic and International Waterborne Commerce, 1970-94* (6-5)
Summary Statistics for Domestic Waterborne Commerce, 1970-94* (6-6)
Stock
Vehicle Stock and New Sales in United States, 1994 Calendar Year* (3-4)
Summary
Summary Statistics for Passenger Cars, 1970-94* (3-12)
Summary Statistics for Two-Axle, Four-Tire Trucks, 1970-94* (3-25)
Summary Statistics for Other Single-Unit and Combination Trucks, 1970-94* (3-26)
Summary Statistics on Buses by Type, 1970-94* (3-33)
Summary of EPACT Section 501 Coverage by Industry, 1994* (5-10)
Summary Statistics for Class I Freight Railroads, 1970-94* (6-10)
Summary Statistics for the National Railroad Passenger Corporation (Amtrak), 1971-94* (6-13)
Summary Statistics for Rail Transit Operations, 1970-94* (6-14)
Summary Statistics for Domestic and International Certificated Route Air Carriers, 1970-94* (6-3)
Summary Statistics for General Aviation, 1970-94* (6-4)
Summary Statistics for Domestic Waterborne Commerce, 1970-94* (6-6)
Supplier
Natural Gas Supplier Fleet Vehicle Daily Miles Traveled Range, 1993* (5-9)
Suppliers
Fleet Vehicles Operated by Natural Gas Suppliers* (5-8)
Survival
Scrappage and Survival Rates for Automobiles, 1970, 1980, and 1990 Model Years* (3-8)
Scrappage and Survival Rates for Trucks* (3-9)

Systems
Class I Railroad Freight Systems in the United States Ranked by Revenue Ton-Miles, 1994* (6-9)
Tax
Tax Receipts from the Sale of Gas Guzzlers, 1980-93* (3-44)
The Gas Guzzler Tax on New Cars* (3-45)
State Tax Exemptions for Gasohol* (5-20)
States with Ethanol Tax Incentives* (5-21)
Federal Excise Tax Exemption for Ethanol-Blended Fuels* (5-21)
Taxes
Federal and Sate Taxes on Motor Fuels, 1994* (5-19)
Technology
Advanced Battery Technology Goals of the U.S. Advanced Batter y Consortium* (5-12) Time

Average Length of Time Fleet Vehicles are Kept Before Sold to Others* (3-38)
Tire
Summary Statistics for Two-Axle, Four-Tire Trucks, 1970-94* (3-25)
Ton
Class I Railroad Freight Systems in the United States Ranked by Revenue Ton-Miles, 1994* (6-9)
Tonnage
Tonnage Statistics for Domestic and International Waterborne Commerce, 1970-94*
(6-5)
Traffic
Intermodal Rail Traffic, 1965-94* (6-12)
Transit
Summary Statistics for Rail Transit Operations, 1970-94* (6-14)
Transportation
Domestic Consumption of Transportation Energy by Mode and Fuel Type, 1994 * (2-11)
Transportation Energy Use by Mode, 1993-94* (2-12)
Transportation Energy Consumption by Mode, 1970-94* (2-13)
Changes in Transportation Energy Use, 1972-94* (2-20)
Changes in Passenger Transportation Energy Use, 1972-94* (2-22)
Changes in Highway Passenger Transportation Energy Use, 1972-94* (2-24)
Changes in Air Passenger Transportation Energy Use, 1972-94* (2-26)
Changes in Freight Transportation Energy Use, 1972-94* (2-28)
Changes in Rail Freight Transportation Energy Use, 1972-94* (2-30)
Prices for Selected Transportation Fuels, 1978-95* (2-33)
Gross National Product as Related to Transportation, 1970-94* (2-35)
Personal Consumption Expenditures as Related to Transportation, 1970-94* (2-36)
Statistical Indices as Related to Transportation, 1970-94* (2-37)
Means of Transportation to Work for the United States: 1980 and 1990 Census* (4-14)
U.S. Carbon Dioxide Emissions from Energy Use in the Transportation Sector, 1980-94* (7-10)
Travel
Passenger Travel by Personal Vehicles for Selected Countries, 1970-93* (1-13)
Vehicle Travel per Automobile for Selected Countries by Trip Purpose* (1-16)
Travel per Automobile Passenger for Selected Countries by Trip Purpose* (1-17)
Passenger Travel and Energy Use in the United States, 1994* (2-15)
Automobiles in Operation and Vehicle Travel by Age, 1970 and 1994* (3-11)
Trucks in Operation and Vehicle Travel by Age of Vehicle, 1970 and 1994* (3-22)
Average Annual/Daily Vehicle Miles of Travel for Fleet Vehicles* (3-38)
Average Number of Vehicles and Vehicle Travel per Household, 1991 and 1994
RTECS* (4-4)
Traveled
Annual Vehicle Miles per Vehicle Traveled by Personal Vehicles for Selected Countries, 1970-93* (1-12)
Highway Vehicle Miles Traveled by Mode, 1970-94* (3-3)
Natural Gas Supplier Fleet Vehicle Daily Miles Traveled Range, 1993* (5-9)
Trip
Vehicle Travel per Automobile for Selected Countries by Trip Purpose* (1-16)
Travel per Automobile Passenger for Selected Countries by Trip Purpose* (1-17)
Average Annual Vehicle Miles, Vehicle Trips and Trip Length per Household for Selected Trip Purposes, 1969, 1977, 1983 and 1990 NPTS* (4-9)
Trips
Annual Vehicle Trips by Number of Household-based Vehicles and Age of Vehicle, 1990 NPTS* (4-10)
Number of Journey-to-Work Trips by Number of Occupants and Vehicle Type, 1990 NPTS* (4-13)
Average Annual Vehicle Miles, Vehicle Trips and Trip Length per Household for Selected Trip Purposes, 1969, 1977, 1983 and 1990 NPTS* (4-9)
Truck
Truck and Bus Registrations for Selected Countries, 1950-94* (1-3)
New Retail Truck Sales by Gross Vehicle Weight, 1970-94* (3-21)
Truck Fuel Economy by Size Class, 1977, 1982, 1987, and 1992* (3-28)
Truck Statistics by Gross Vehicle Weight Class, 1992* (3-29)
Truck Statistics by Size, 1992* (3-30)
Trucks
New Retail Sales of Trucks 10,000 pounds GVW and less in the United States, 1970-94* (3-20)
Trucks in Operation and Vehicle Travel by Age of Vehicle, 1970 and 1994* (3-22)
Sales-Weighted Engine Size of New Domestic and Import Light Trucks by Size Class, Sales Periods 1976-94* (3-23)
Period Sales, Market Shares, and Sales-Weighted Fuel Economies of New Domesti c and Import Light Trucks, Selected Sales Periods 1976-94* (3-24)

Refinery Yield of Petroleum Products from a Barrel of Crude Oil, 1978-95* (2-2)

[^0]:    'Automobile registrations for all other countries were calculated by subtracting listed countries' registrations from the world total.
    Data not available.
    ${ }^{\mathrm{c}}$ Average annual percentage change is for 1960-94.
    ${ }^{\mathrm{d}}$ Average annual percentage change is for 1955-94
    ${ }^{\mathrm{e}}$ Average annual percentage change is for 1975-94.

[^1]:    ${ }^{\text {a }}$ Prices represent the retail prices (including taxes) for premium leaded gasoline. Prices are representative for each country based on quarterly data averaged for the year.
    ${ }^{\mathrm{b}}$ Prices represent the retail prices (including taxes) for premium leaded gasoline on January 1 of the year.
    ${ }^{\text {c }}$ Unleaded regular gasoline.
    ${ }^{\mathrm{d}}$ These estimates are for international comparisons only and do not necessarily correspond to gasoline price estimates in other sections of the book.
    ${ }^{\mathrm{e}}$ Adjusted by the U.S. Consumer Price Inflation Index.

[^2]:    ${ }^{\text {a Prices represent the retail prices (including taxes) for diesel fuel. Prices are representative for each country based on quarterly data averaged for the year. }}$
    ${ }^{\text {b }}$ Prices represent the retail prices (including taxes) for diesel fuel on January 1 of the year
    ${ }^{\text {c }}$ Data are not available.
    ${ }^{\text {d }}$ These estimates are for international comparisons only and do not necessarily correspond to gasoline price estimates in other sections of the book.
    ${ }^{\mathrm{e}}$ Adjusted by the U.S. Consumer Price Inflation Index.

[^3]:    ${ }^{\text {a Schipper, Lee and Wienke Tax, "New Car Test and Actual Fuel Economy: Yet Another Gap?" Lawrence }}$ Berkeley Laboratory, Berkeley, CA, Fall 1993.

[^4]:    ${ }^{\text {a }}$ Best estimate for U.S. petroleum consumption is the amount of petroleum products supplied to the U.S. in a given year. This is not the sum of crude oil production and net imports due to processing gain and stock changes.
    ${ }^{\mathrm{b}}$ Transportation petroleum use can be found on Table 2.5
    ${ }^{\text {c }}$ Data are not available.
    ${ }^{\text {d }}$ Average annual percentage change is for years 1973-93 and 1985-93.

[^5]:    ${ }^{\text {a }}$ Includes supplemental gaseous fuels. Transportation sector includes pipeline fuel only.
    ${ }^{\mathrm{b}}$ Includes electrical system energy losses.
    ${ }^{\text {c }}$ Energy generated from geothermal, wood, waste, wind, photovoltaic, and solar thermal energy sources.
    ${ }^{\text {d}}$ Values represent lower bound estimates.
    ${ }^{\mathrm{e}}$ Consumption includes gasoline portion of the mixture.

[^6]:    ${ }^{a}$ Civilian consumption only. Totals may not include all possible uses of fuels for transportation (e.g. snowmobiles).
    ${ }^{\mathrm{b}}$ Includes gasohol.
    ${ }^{\text {c }} 1993$ data; 1994 data are not yet available.
    ${ }^{\mathrm{d}}$ Two-axle, four-tire trucks.
    ${ }^{\mathrm{e}} 1985$ data.
    ${ }^{\mathrm{f}}$ Represents an estimate of energy purchased in the U.S. for international air carrier consumption.

[^7]:    ${ }^{\text {a }} 1993$ energy use data; 1994 data are not yet available.
    ${ }^{\mathrm{b}}$ Data are not available.
    ${ }^{\mathrm{c}}$ Nautical miles.
    ${ }^{\mathrm{d}}$ Amtrak only.
    ${ }^{\text {e }}$ Sum of passenger train cars and locomotive units.
    Passenger train car-miles.
    ${ }^{3}$ Revenue passenger miles.
    ${ }^{h}$ Light and heavy rail.

[^8]:    "The definition of intercity truck was "tightened" to exclude smaller trucks. See Appendix A for details.
    ${ }^{\mathrm{b}} 1992$ data are the latest available. 611 miles is for general freight (less than truckload). Based on data from the Eno Transportation Foundation, the average length of haul for specialized freight (truckload) was 283 miles.
    ${ }^{\text {c }}$ Includes commerce by foreign and domestic carriers in the U.S.
    ${ }^{\text {d }}$ Data are not available.
    ${ }^{\mathrm{e}}$ Railroad measures are: Number vehicles $=$ number freight cars, Vehicle-miles $=$ car-miles, Ton miles $=$ revenue ton-miles.

[^9]:    ${ }^{a}$ Series not continuous between 1983 and 1984 because of a change in data source by the American Public Transit Association (APTA).
    Data are not available.
    ${ }^{\text {c }}$ Beginning in 1993 data became available on alternative fuel use by transit buses.
    ${ }^{\text {a }}$ Average annual percentage change is for years 1970-93 and 1984-93
    ${ }^{\mathrm{e}}$ Average annual percentage change is for years 1973-94.

[^10]:    ${ }^{a}$ These data have changed from previous editions due to a change in source for energy use data. Previous estimates were based on sales.
    ${ }^{\text {b }}$ All two-axle, four-tire trucks (which would include trucks which may not carry freight).
    ${ }^{\text {c }}$ These data include minivans and sport utility vehicles which were not previously included in this category.

[^11]:    ${ }^{\text {a }}$ Consumer grade.
    ${ }^{\mathrm{b}}$ Adjusted by the Consumer Price Inflation Index.

[^12]:    ${ }^{\text {a }}$ Refiner acquisition cost of composite (domestic and import) crude oil.
    ${ }^{\mathrm{b}}$ Average for all types. These prices were collected from a sample of service stations in 85 urban areas selected to represent all urban consumers. Urban consumers make up about $80 \%$ of the total U.S. population.
    ${ }^{\text {c }}$ Adjusted by the Consumer Price Inflation Index.

[^13]:    ${ }^{\text {a }}$ Adjusted by the implicit GNP price deflator.

[^14]:    ${ }^{a}$ Transportation Consumer Price Index includes new and used cars, gasoline, auto insurance rates, intracity mass transit, intracity bus fare, and airline fares.
    ${ }^{\mathrm{b}}$ Data are not available.

[^15]:    Adjusted by the Consumer Price Inflation Index.
    ${ }^{\mathrm{b}} 1967$ "Average Transaction Price" plus the value of added safety and emissions equipment as determined by the U.S. Bureau of Labor Statistics (BLS), all inflated to current dollars, using the U.S. BLS, "New Car Consumer Price Index - All Urban Consumers." For example, 1969 is equal to the 1968 value plus the BLS stated value of added safety and emissions equipment for the 1969 model year multiplied by 1968-1969 monthly changes in the New Car Consumer Price Index.
    c 1967 "Average Transaction Price" inflated to current dollars.

[^16]:    ${ }^{\text {a }}$ Adjusted by the Consumer Price Inflation Index.
    ${ }^{\mathrm{b}}$ Based on 10,000 miles per year.
    ${ }^{\circ}$ Data for 1976 and 1978 are not available.
    ${ }^{\mathrm{d}}$ Fixed and total operating costs preceeding 1985 are not comparable with figures after 1985. Fixed cost depreciation from 1975-84 was based on four years or 60,000 miles. After 1984, the depreciation was based on six years or 60,000 miles.

[^17]:    ${ }^{\text {a }}$ Less than 10,000 pounds gross vehicle weight.
    ${ }^{\mathrm{b}}$ Adjusted by the implicit Gross National Product price deflator.

[^18]:    ${ }^{\text {a }}$ The probability that a 1970/80/90 model year automobile will be retired from use within a given year.
    ${ }^{\text {b }}$ The probability that a 1970/80/90 model year automobile will be in use at the end of a given year.

[^19]:    ${ }^{\text {a }}$ Does not include import tourist deliveries.
    ${ }^{\mathrm{b}}$ A transplant is an automobile which was built in the U.S. by a foreign firm. Also included are joint ventures which are built in the U.S.
    ${ }^{\text {c }}$ Data are not available.

[^20]:    ${ }^{\text {a }}$ Automobiles sold as of July 1 of each year.

[^21]:    ${ }^{a}$ Includes cold rolled and pre-coated steel.

[^22]:    ${ }^{a}$ These figures represent only those sales that could be matched to corresponding EPA fuel economy values.
    ${ }^{\mathrm{b}}$ Revised.
    ${ }^{\text {c }}$ There were no minicompact automobiles sold in 1976.

[^23]:    Trucks sold as of July 1 of each year.

[^24]:    ${ }^{\text {a }}$ Includes driver schools.
    ${ }^{\text {b }}$ Data are not available.
    ${ }^{\text {c }}$ Newly available data resulted in changes for the 1993 data.

[^25]:    ${ }^{\text {a }}$ Less than $8,500 \mathrm{lbs}$ GVWR. Includes ambulances.
    b/501-23,999 lbs GVWR.
    ${ }^{\mathrm{c}} 24,000 \mathrm{lbs}$. Or more GVWR.

[^26]:    ${ }^{\text {a }}$ Adjusted using the Consumer Price Inflation Index.
    ${ }^{\mathrm{b}}$ These are fines which are actually collected. Fines which are assessed in a certain year may not have been collected in that year.

[^27]:    ${ }^{\text {a }}$ Includes all vehicles owned by or available on a regular basis to the household.
    ${ }^{\mathrm{b}}$ Includes trips where age of vehicle was unreported.

[^28]:    ${ }^{\text {a }}$ This category was "Bus or streetcar" in 1980.
    ${ }^{\mathrm{b}}$ Data are not available.

[^29]:    ${ }^{0}$ Under the early rulemaking scenario. Additional rulemaking is required by December 15, 1996 for private AFV requirements to take effect.
    ${ }^{0}$ Based on 50,000 vehicle acquisitions per year.

[^30]:    ${ }^{\mathrm{a}}$ No cases in sample.
    ${ }^{\mathrm{b}}$ Data withheld because Relative Standard Errors are greater than 50 percent or fewer than three companies are represented.
    ${ }^{\text {D }}$ Data on compressed natural gas vehicles were collected, however, much of the data were withheld (see footnote b) or there were no cases in the sample.

[^31]:    ${ }^{\text {a }}$ Among these vehicles, 30,000 are owned/operated by gas-only companies, 33,000 by dual utilities and 10,000 by gas producers and transporters.
    ${ }^{\text {b }}$ Off the top 35 propane providers only.
    'Those with production capability of at least 50,000 barrels per day.

[^32]:    ${ }^{\text {a }}$ Reformulated gasoline was used for all emissions tests.
    ${ }^{\mathrm{b}}$ Average fuel economy measurements during emissions tests.
    ${ }^{\mathrm{c}}$ Not a production vehicle, part of a vehicle demonstration fleet.

[^33]:    ${ }^{\mathrm{a}}$ All prices are per gallon or gallon equivalent.
    ${ }^{\mathrm{b}}$ Annual flat fee.
    ${ }^{\mathrm{c}}$ Per 1.25 therm.
    ${ }^{\mathrm{d}}$ Per $100 \mathrm{ft}^{3}$
    ${ }^{\mathrm{e}}$ AFV's are exempt from paying ,otor fuels tax until Jan. 1, 1996; for any taxpayer, the number of vehicles subject to this exemption cannot exceed the greater of 10 vehicles or $10 \%$ of the taxpayer's vehicles propelled by a fuel subject to the state motor fuel tax.
    ${ }^{\mathrm{I}}$ Per therm.
    ${ }^{\mathrm{g}}$ Optional flat fee may be paid instead.
    ${ }^{\mathrm{h}}$ Given in million cubic feet.

[^34]:    ${ }^{\text {a }}$ Scheduled services of domestic operations only. The average passenger trip length for international operations is more than three and a half times longer than for domestic operations
    ${ }^{\text {b }}$ Available seats per aircraft is calculated as the ratio of available seat-miles to revenue aircraft-miles.
    ${ }^{\text {c }}$ Passenger load factor is calculated as the ratio of revenue passenger-miles to available seat-miles for scheduled and nonscheduled services.
    ${ }^{\mathrm{d}}$ Energy use includes fuel purchased abroad for international flights.
    ${ }^{\text {ESCh}}$ Scheduled services only
    ${ }^{\mathrm{f}}$ Data are not available.

[^35]:    ${ }^{\text {a }}$ Data are not available
    ${ }^{\text {b }}$ Active fixed-wing general aviation aircraft only
    Include rotocraft.
    ${ }^{\mathrm{d}}$ Revised to correct for nonresponse bias.
    ${ }^{\circ}$ New data were added for "other" aircraft which were not previously available. These include gliders, lighter than air, and experimental aircraft.

[^36]:    ${ }^{a}$ All movements between the U.S. and foreign countries and between Puerto Rico and the Virgin Islands and foreign countries are classified as foreign trade.
    ${ }^{\mathrm{b}}$ All movements between U.S. ports, continental and noncontiguous, and on the inland rivers, canals, and connecting channels of the U.S., Puerto Rico, and the Virgin Islands, excluding the Panama Canal.

[^37]:    ${ }^{\text {a }}$ Grand total for self-propelled and non-self-propelled.
    ${ }^{\mathrm{b}}$ These figures are not consistent with the figures on Table 6.4 because intra-territory tons are not included in this table. Intra-territory traffic is traffic between ports in Puerto Rico and the Virgin Islands.

[^38]:    ${ }^{\text {a }}$ Does not include self-powered units. From 1972 to 1979, the number of locomotives used in Amtrak passenger operations are subtracted from the total locomotives used in passenger and freight service to calculate the number of Class I locomotives in service.
    ${ }^{\mathrm{b}}$ Does not include private or shipper-owned cars.
    ${ }^{\text {c }}$ These data have changed from previouseditions due to a change in source. Previous estimates were based on sales.
    ${ }^{d}$ Data represent total locomotives used in freight and passenger service. Separate estimates are not available.

[^39]:    ${ }^{a}$ Data are not available.
    ${ }^{\mathrm{b}}$ Average annual percentage change is for years 1988-94.

[^40]:    ${ }^{\text {a }}$ Data are not available.
    ${ }^{\text {b}}$ Energy use for 1994 is not directly comparable to earlier years. Some commuter rail energy use may have been inadvertently included in earlier years.
    ${ }^{\text {c }}$ Average annual percentage change is for years 1972-93.
    ${ }^{\mathrm{d}}$ Average annual percentage change is for years 1973-93.

[^41]:    ${ }^{\text {a }}$ Series not continuous between 1983 and 1984 because of a change in data source by the American Public Transit Association (APTA). Beginning in 1984, data provided by APTA are taken from mandatory reports filed with the Urban Mass Transit Administration (UMTA). Data for prior years were provided on a voluntary basis by APTA members and expanded statistically.

    1970-79 data represents total passenger rides; after 1979, data represents unlinked pasenger trips.
    Estimated for years 1970-76 based on an average trip length of 5.8 miles.
    ${ }^{\mathrm{d}}$ Calculated as the ratio of passenger-miles to passenger trips.
    ${ }^{\text {e }}$ Large system-to-system variations exist within this category.
    ${ }^{\mathrm{f}}$ Data are not available.
    ${ }^{\mathrm{g}}$ Average annual percentage change is calculated for years 1977-94.

[^42]:    ${ }^{\text {a }}$ Thousands of short tons.
    ${ }^{\mathrm{b}}$ Data are not available.
    ${ }^{\text {c }}$ Includes all off-highway and nonhighway vehicles.

[^43]:    ${ }^{a}$ The sums of subcategories may not equal total due to rounding.
    ${ }^{\text {b }}$ Preliminary.
    ${ }^{\text {'Recreational marine vessels. }}$

[^44]:    ${ }^{\text {a }}$ The sums of subcategories may not equal total due to rounding.
    ${ }^{\mathrm{b}}$ Less than 8,500 pounds.
    ${ }^{\mathrm{c}}$ Data are not available.

[^45]:    ${ }^{\mathrm{a}} \mathrm{CV}=$ Conventional vehicles
    TLEV $=$ Transitional low-emission vehicles
    LEV = Low-emission vehicles
    ULEV = Ultra-low-emission vehicles
    ZEV = Zero emission vehicles

[^46]:    ${ }^{1}$ This update was produced with assistance from Jacco Farla (on leave from the Univ. of Utrecht), Maria Josefine Figueroa, Todd Goldman, Roger Gorham, Henrik Gudmunsson (Danish Environmental Laboratory), Marta Khrushsh, Katrin Millock, and Michael Ting.
