## FqPORT NO. 3311

IN TUE ITATTER OF MAKING ACCIDENT INVESEIGATTON FEFORTS UNDER TYE ACOINENT REPORTS AUT OF MAY $6,1920$.

THE LOMG ISIAND RAIIROAD COAFAYY

IErch 27,1950

Accident near Rockrille Centre, N. Y., on February 17, 195C, caused by failure to operate the east-bourd train in acoordance rith sional indications.

REPOET OT THE COMTSSTUN

PAMTERSOA , Commissioner:
On February 27, $1750^{\circ}$, there was a side collision between two passerger trains on the Lorg Is and difi]roac near Rockvilie Centre, $N$. V. winich resulted in tine deatn of 29 passenexers ard a reilroad employpes not on duty, and the iniury of 124 passengers, 18 railroad emoloyees not on duty, and 16 train-service emriloyees. This gccident was investigated in conjuncticn with rerresertatives of tine Ner York Pubiic Service Comaission.

Under authority of section 17 (2) of the Irterstate Commerce Act the awoverentitled proceeding was referred by the Commission to Comrissioner Pattercon ror consideration and disposition.

To Babylon $\longrightarrow$

## Location of Accizont ent Nothad of Oomation

Tris accidert oncurped on trat art of the railrood
extandina betweon Jaraica anj Farylou, N. ## Description of Accident

No. 175 , a west-bound first-aluss passenger train, consisted of 12 multiple-unit cers of steel construction. It ws being operated from the front control compartgent of muitinle-unit on 1919, the first unit of the train. İ donaited from Babylon at 9:58 p. m., on time, passod sicnal t , wirich indicatea Approach-medium, storped at the station et Rockvilie Centre and departed at lo: 34 p. m., 3 mirutos late, possed sicnel ond, wich indiceted Mediumcleer, and, wile movins at an estimated apeed of 25 miles per hour, collided with ivo. 192 at a paint $\varepsilon, 060$ feet most of the stetion at Rociville Contre.

No. 192, an orct-bound firct-cirsa pasancer train, consistac of la multiole-anit cars of steel construction. It ris 3 being operated from the front control coroartnont of multinle-unit cer l4QR, the first unit of the troin. It passed Vol.ey, the ist open ofrice, 2.71 milos resto of tha point of accident, at lo:31 p. m., on time, passed signal Sl76, rhich indicated Approtch, pessed sicnal 2, which incicitra Stoo, and, while movine et an estimeted

The urains collider at a point acout 11 feet east of the frog at tire west and of the gantret.. The rinat cun and the front truck of the second car of No. 175 were derained to the north, and the urein stoppod rith the west end of the fixst cer 49 feet rest of tre point of accident. The Iiret of stopped against an embaskment rortir of the tie diand leailed to th; rigint an an ancle of 30 derrees. The irnt side of the front vestibul? was anishoce arat tre left siue of tho var was drmolished. The second car rotainea uniz it and wac budy damaged. The third, fourtin, fifith, alxil, nintin, are tenth cars wore socerat damaged. The Front tinck of the first car or No. 132 wen doraijed to ins south, and
the train stonped rith the ast end of the first car about 50 fate enst of tie paint of accident. The first car romainea urright, The left side of the front vostibule reas crughec and the left side of the car wris aenolished. The revilier of the cars of this train except the sirintin, ninth, anc trelfth cars wore somerhat damaged.

The rotorman, the conductor, the front brateman, the flaman, and two ticket co: lectors of "o. lrs, and the moturman, the conductor, the front brakeman, the flafmon, and rix ticket collectors of No. 192 were injured.

The reather was nlear at the time of the accident, rhich ocourrec \& t 10: $35 \mathrm{p} . \mathrm{m}$.

The muixtiple-unit cors of these trains are equipned with elestro-pneumatic anc automatic alr brekes. A safoticontrol Prature actuated by a contact plunesr on the controllen handle is provided. If pressure on this planer is relcased, the train oraies will become apolied in cmerecroy unlose a orarp application of a predetermined brake-oylincer pressure has becn made. The clecro-pncumatic and the automatic foatures of the train krake system are operatod by one brake valve.

## Discussion

The brakes añ + Ki= cab sianal equipment of No. 175 rome tested before the roin acparted from Bebvion, and funotioned pronerly. Severel station stops rer made bettroen Eab: ?on anc゙ Fo : Arille Contre añ the brekes finctianed proorrly When usef. As tro train ar nroachad Centre inturiocking,

 the trin to frter and to nave rxclusive richt, to tho riute through the interlocking. Finc fondiant was lighted brisitizy. As tic train aprroached the reet end of the rantlet, tin motor-
 of iis tiain and then realined thrit C2R, Tres on governs the entrance of cast-bound traine to tion gantlet. He immodiatoly inntaot-a an emoreroy breke cirrlí-
 occurac. before th- brake ipnlication hed b come eitncijve.

The crow of No. 132 reportod for duty ot Ponnsylvanio.
 accidont, at E:06 p.m. They used the equiprient of io. In2 in making one round trip sutran Liow Iork and Babylon, end
woro on coute from New Yorlz to Babylon on treir secone trip when tho accident occurred. Before No. 192 departed from Nor Yortr the brekes were tested by a car inspector and functionod proverly. Undor tha operating rules of this carricr tino motorman was required to make a departure dosi of the cab-signal ecuipment and to notify the proper authory ty if it res not in on-ratinc condition. A scheduled station stop was made at Jameica in the usual manner. After the trein departed Srom Jamaica the conductor was soatod at the recr of the first cor and the other memons of tho train crew were in various locetions throughout tho other cais of the trin. The conductor seid that the motomen was alone in the control compartment at the front of the firct car. The conductor heerd tho grade-cross:ng enginctristle signa? sounded for two ore crossings in the vicin ty of Valley Streem, 2.8 miles west of the poini of eccidont, but he aid not notice whether it was sounc ad for a sracie crossing about 450 feet test of sienal 02R. The concuctor seid that from his position at the reer of the first car he could not hear the sound of the cab-signal warain-rhastle while the train wes in motion. Thereforo, he dic. not know whether this whistle sounded after tho train passica sicmal sl76. Nembers of the train crew said they thought ive speed of the train as it aporocched siganl 0ar was about 25 miles per hour, rhich res the usual soecd for tho trein in that vacinity. None oi them observed the asyoct displayed. by signal Sl76 or 0?. There we s nothing unusual about the oparetion of the train until the brakes wore apolied in emergency immediately before the collision occurred.

An caemination of the equipment efter the accident occurred disclosed thet the brake-volve hendle in the control compartment of car l482 of No. 192 was in emergency pos tion, the control switch ras in position for electrom pneumatic operation of the train brikes, the controller hancile wos in neutral position, and the cab-sienal warnengwhistle cutout cock res in nosition for the whistle to sound then the cab signal changed to a more restrictive aspect. The air-brake equipment of car 1482 wr dam gea to such an extent that tests could not de mece. The nir brilies 0 ? the other cors of No. 192 were tested after the accident occurred, end they functioned properly.

Inspection and tests of the sienal apparatus at Cenire interlocking were begun by simnel forces of the carrier about 45 minu'ves after the eccident occurrod. The lever used to establ:sh the direction of traffic between simnals 02 d and $02 R$ was found to be in position for west-bound movements anc.
was locied electrically in that position by occupancy of trock circuits in the route. The lever controlling sienal 02 . ras in position for thet simnal to indicate stop and ras locked in that position by the mechanical locking of the control mechine. The mechanical locking of the control machine, the approach locking and traffic locking circuits, the control circuits of the signals, and the wayside caiosignni apparatus were tested and were found to be operating properly. The operating cheracteristics of relurs and electric locks were within the limits in which they rere designed to obercta. All circuits were tested for rounds, and there wes no condition found thet would have coused on improver operation of the signel systan. Abovt 5 ninutes after the eccident occurred signal $02 \vec{R}$ whs ouscived to be indiceting stop.

During this investigation the motormen of No. 192 declinod, through his attornev, to make a statement regarding the cocicent. Accoriing to the records of the reilrocd comeny the motorman of $\overline{\text { wo }}$. 192 had been employed as an engineer and motorman for more than 25 years. A $\ddagger$ the time of the eccident he hed been on duty approximetely four hours. The members of the crew of No. 192 said the truin was operated betwen New York and the point of accjecnt in the usuci manner. The train passed Valley, 2.71 miles: mest of the point of accident, at $10: 31 \mathrm{p}$. m., on time, and an average speed of about 40 miles per hour was mainteincd betreen Valley and the point of accident. Apperently the trin was under control in the vicinity of signal Sl76 and a orcike aprlication was made before the train entered upon the temporery traci, because the speed of the troin when it entcred the descending grade east of the approach si nel wis abovt 30 miles per nour. According to members of the train orew the spood further was reduced to about 25 milos per hour on the desconding grade before the brakes wero applied in emergency. 4 crossing wetchmen stationed at 0 crossing about 450 feet west of signel $02 R$ said he did not hecr the engine whistle of No. 192 sounded as that train aproacinc. It could not be determined whether the cab signel equipment of No. 192 wes tested by the motormen boiore deperture from New Yorí. Honever, he did not file a revort thet tho equipment wes defective in any menner.

Sinco this accident occurred, the maximum authorizod spece of trains has beon restricted to 15 miles por hour betreen points 500 fert east of signal $02 L$ and 500 feet wost of signal 02R. The control circuits of signel $T$ and
sichili Sl76 hare been arranged so thet sienal $T$ incicatus
Stor then the route is lined for an east-boune moverent cyen the ganivlet and sigmal Sl76 indicates Stop winen the roliee is lineed ior a west-bounā movement. A monually operited troin-stop device of the tripper type has been instrined at each of these sicnals. This device causes an emercency applicetion of the train brakes when a multiple-unit onr passes the device ricile $\vdots t$ is in tripping position. Prese devices are operated by employees under the direction oit the oper: toin at Centre interlocking. Whon the route is liner for an enst-bound moverent, the train-stoo device on the enstruid treck at signel Sl76 is placed in non-tripping position end the device on the westward track $= \pm$ simnel $T$ is menntoined in tripoing position. When the route is lined for itostbound moverent, the device on the restwand treck at siral T is placed in non-tripping position and tho device on the cestrard treci at siçal sir6 is maintained in tripping position.

The ocrrier estimet s that the permanert tracks at Roclrville Centre rill be placec in service about Mey lo, 1950. The operation of trains or $r$ the temporery trachs wil_ be iiscontinued at thot time and double-irack operction will be zesumed.

## Cause

It is found thet this accident was caused by fripure to operate the esst-bound train in accondance -ith sigmol indications.

Datod at Washinston, D. C., tris twenty-seventil day of March, 1950.

By the Commission, Commissioner Patterson.
