> Ex Parte No. 184
> ACCIDENT AT UNTON STATION, WASHINGION, D. C.

Decided February 17, 1953

Accident at Union Station, Washington, D. C., on January 15, 1953, caused by a train movine out of control as a result of the brakes on the rear 13 cars being inoperative from the locomotive because of a closed angle cock at the rear of the third car.

Edward S. Brumley for the New York, New Haven and Hartford Railroad Company.
Georee E. Eanilton, Jr., and John L, Hamilton for the Wasning 0 n Terminal Company.
A. Schrocder for the Pennsylvania Railroad Company.

REPORT OF THE COMVISSION
DIVISION 3, CONAISSIONERS PATTERSON, JOHNSON, AND KNUDSOIN
PATIERSON, Commissioner:
This is an investigation by the Commission on its om motion rith respect to the facts, conditions, and circurstances connectod with an accident which occurred on the line of the Fashingon Terminal Company at Union Station, Washington, D. C., on Jonury 15, 1953. Searing was had at Fashington, D. C., on January 26, 27, 28 and 29, 1953. The accident was a derailment of a passenger train and resulted in the injury of 62 passencors, O licenscer in and about the station, 4 Pullman Company employees, 1 trainnseivice employee, and ll station employees.

## Location of Accident and Motiod of Operation

Tinis accident occurred on that part ot the railrond extonding between Division Post, 0.96 mile north of Union Station, and Union Station, Tasnineton。D.C. Passengon trains of the Eennsylvania Railroad operating into anc ont of Union Station operate over its Voryland Divianon betieen Zaltimore, Ma., and Division Post, and over the Teminal Company between Division Pose and Union Station \#otr. lines are provided with a catenary system for the electionc propuls.o. of trains. North of Division Post, the Varyiand Division o: the Femasylvaria is a coublemtrack line over rindeh troins an operated by automatic block-sienal and cob-sifinl indications supplencuted by an outomatic soced-control gy Beyron "c" Inteilockinc, locatnd frmediately south of Jivjemon Fos", ang the north limats of "X" Interlocining, 0 e 47 rile so'th oi Iuvision Post, the line of the Termlnal Company in a 10-treck the over wich trains are operated by siznal Inciontions. These tuacks are desimated from rest to enci as track Nos, ${ }^{2} 4$ to 43, incluslve within interlocking limits at "IKi Intorlocking these tracks converge with 31 station tracks which ano designated from west to east as tracks Nos. $\ln$ to Bl. inclusivo. The accicient ocoumec at the south end of trac: "on 16. Frows Nos. 1 to 20, inciusuve, enter the station at gtreet levol and are stub and tracis. The otinen tracks enter tino station at a lower lovel. A south-bond train movine on

 north o" the south, or stub end of track No. 26 . tacin enc on this 0 orobover is provided with No. 8 doublemsip switones ancl rovablempoint frogs. Fron tho north, via the soutirned main traci: of the penmsylvania, track No: 41, and track Noe 16, thowe aro, in succession, a tangont more than 1 mile in Joneuna a 50 curre to the left 1,720 fret, a taneent 1,640 fout io tio crossovor betron tracks Nos, 41 and 16 , and a tangent $2,1 \leq 0$ feot iron the crossover to the stub enc of tracz :io. 10. Tron tho nortin the grode iss successively, 0,49 percent asconiza; 4,000 tut, 0.73 percont duscendine 5,500 feet, level 1.2 ieru, and O.61 porcont asconding $1: 380$ - "eet to the stub ond of then No. IO.

Automatic simnal 1339, governing sorth-bound moromen us on the southrard main track of the Ponnsylvania, somi-automionc si manls 70L, 46L, 24L, and 156L, governing south-bound :2vine'ts on tracir io. 41, and semi-automatic sienais l28L, and 85 , Govoinim: south-bound movanchts on track No. 16 , are jocatua: respecturviy, 2,09 mlles, 5,030 fect, 3,970 foct, 3,510 icot: 2,570 fent 2,100 foct, and 1,690 ient north of the stub end of tuack $\because 0$. 1S. Simnal 1339 is of the position-licht type, and the ofinor siensis aro of tho color-position-light type.

Tho automatic cab-signal system and the automatic spocacontrol sistom in use on the Pennarlvania are so arranged that 1 I a turoin passes a sicnal indicating "Approach" at a spocd in excors oi 30 miles ner rour a rull-service brake-pipe roduction will be made automatically unless the enginoor inmociadoly mokes a service brake-pipe reduction of predetorninea value. After the speed has boen reduced to 30 males per rour or less the brakes may be released, but thej will arain becone applied if a spoed of 30 miles per hour is cxcecded thile tine train is movine on an "Approach" cabarismal indication. If a train passes a signal raquiring movomonit at restrictod specd the device tunctions in the same mannor except that tho siseed is restricted to 20 instead or 30 miles por bour. The autowatic speecimontrol ecuipinent on a loconotive may bo made finoporative by the enrincer while the locomotive is oponating over linos not equippod for antomatic cab-sirmal opcrajion.

At the stur end of track No, le an all-stocl oumpins post ic colvod to the track rails. The bumpor face is apnorinatcly 6 ieet north oi the onds of tine rails and $a$ iect 10 inchos aivove the levol of the tops of the rails. An ornamontal wought-iron train fence soparates the south ondo on the station platiormsfron the passonger concourse. This sonco is located 6l. 5 ficet soluth of the ends of the tracks and is at idsint angles to the tracks. The passenger concorise is 760 Ieut in length and 84.7 iect in width. Sevoral vestibules at tho soutin side of the concourse and opposite the ends oi tracks lios. 12 to 20, inclusive, afiord passageway betweon tric concourse and the main vaiting room of the station.

The maximum authorizod speed for south-bound basseneen troins is 30 miles per hour on the main track of the Ponasylvania, 25 miles ocr hour betwion signal $76 I$ and signal IEOL, and 15 ailes nor hour between sirnal 156 i and the station platiomsat Jnion Station.

## Description of Accicent

No, 173, a southmbound first-class Pennsylvania passoneer train desienated as the Federal, consistod of elcctric locnmotive 4876,3 coaches. 1 combination bascasc-soach, and 12 slocpine cars, in the order nomed. The ilrst throe cars and the sixth, ninth, tonth, thirteentio Iourtecnth, and gixteonth cars were of liehtreight steel construction and were odinpod with ticintlock couplers. The othor cans revo of convontioral all-stocl constrinction, and wore equippod with tyon $E$ coupiers except the fourth, which was equipped

with Pitt couplors. The train passod Landover, r.l milos north of Üion Station ani the last opon ofilec on the line of the Ponsylvania, at 8:50 an m., 20 minutos late, passca "C" intorijocinge on tracit No. 41 at $6: 36$ a, m., 19 minutos lato, croscod fiom track 150.41 to trick NO. 16 ot "K" Interlocking, ana millo movin: at on estimated speed of 25 to 40 miles per houn it stivck the bumping post and was durailed at the stub and ci track No. 26.

The locomotive demolished the bumpine post and a portion of the train folec ard cnters the concourse. It broke timounh the floor of the concourse and stomed with the front ond suboenced ir. the wreckage of the floor and opposite the cnd of Hac: No. 15 and a few feet north of the south rall of tire concourse. The rear end of the locomotive dropped to the flloon oi the bageage room below the concounse and stoppod arout 65 feet south of the stub end of track No. IG. The first onn stopped with the front end agninst the rear ond of the loconotive and the rear end suapended over the end of track 2io. 26. A separation occurred betreen the inst and second cars. Trie second car stopped approximately in line with thac: Non 15, with its front end about 100 Ieet gouth of the and of that track. The front end broke tinourn the Eloor of the concourse, but did rot drop to the floor of tre bargage room. The third car stopped with the rear ena on tio ücucr structure of track No. 16. All of these onjes remined uright. The fourtin, fifth, and sixth cars vore derallud by the force of the impact. They stopped upityrt and approzinatriy in line with tracs No. 16.

The locomotive was conslderably danofed. The entire body anc. unc crimane of the rimst car whe twisted, and there was ertensive Gonage to both the inside and the outside of tine body and to tho appurt.nonoos below the floor lovil. The tront ond of the second car was crushed ind torn, the right side of the body ves cont and twisted, and there was extonsivo damafo to tho intorior end to thr impurtonemors below the fioor level. The tifind car ras not bediy danged. The fourth, firti, and sixth caus rove sightly domoged.

Tio rireman of No, 373 and Il stetion employees of the Washis ton Torminal Corpany were injured.

The locomotive of ${ }^{2} 0.173$ was equippod with sex broice equipront. The reguiatory devices wors adjusted to supply brakemine pressure of 110 rounds. Tro first three cars and the siati, ninth, tenth, thirtoenth, fourteerth, and sixteonth cars trove couidjed with Dad brate equipment. the other cens wel e cgurped with ve braire cquipnont.

The wather was clear at the time of the accident, winch ocounder cbolt 8:3E a. m.

## D1scussion

IVo. Irz oniginatos at Eoston, tuss, and is operatod orer the No: York, Nev Haven and Hortoro Foilroad from Boston to Ponasylvaria Station, New York, N. Y., 231.58 miles , and ovor the Ponostivania and the Washincton Terminal thence to Union Station, Vashington, D. C., 224.6 mizen. On the day of tio accident tris train departod fron Ponnsylvaria Station at 4: 03 o. m., 56 minutes late. A iomminal test of the braios was mado bofore tro trin dopastod end the braders fonctionod proporly wion used in controlling the speed of the train at vaicds boints and in maing ototion stops at philadelpila, Pa., Filmagton, Del., and EnJtinore, Kä, 90. 4 miles, IIGoI milos, anc i34, 5 milco, rospeotively, south of zemasylvania Staتion. After tne troln doparted Iron Saltimore, at r:59 a. ... the engiterr did not iove occasion to use the brokes until tuc train was passing signal 1330. miaci indicatod "Approach," A" thes time the speed res between 60 and 70 miles nir hour. As tho oriin passsa the signel the indicotion of the cab shenal chengod to "Approach" and the cab-signal winstle counded until it was acknowledged by the engineox. The ongineer moved tice controlier from tie tonth or twolith notch to tive fifth notcin and made a split brakerpipe rocuction of lf nouncs. The initial reduction was betwen 5 and ? ?ouncon, and the recuction was tien increas d to a totel of 17 poundi. The eromoer dia not noticc thet the exinaust from the bralse valvo was unusually short, but when the train reached a point about $3, C O 0$ ieet south of the sisnal he observed that the anood of the thain wos not being reducea in a nomal monicr. He then anvoct the controller to "Ofe" posituon and placod the autonatle brake valve in emorgency position. The excaust from tio brake valvo was short and the emergercy application apparcatiy had no nore cffect in reavolng the speed of the troin tian the service application hod. Ee then notiriod the finonan that tho brolsos werc not effsctive and, as the train rondoached "C" Intcrlocring, he becan to sound the prowntic hom in an osfort to wom other employeos that the tionin vas out of controi. The sander vaive vac open durdige this timo. Wien the front oi the train reached a point acout 1,500 root norti of the stub ond of track No. 16 tho entanor attombtod to reverse tive motors, but the overlond relays 1 manclatoly functioned and this action did not effect ary ruminor reduction 1 n speed. Fe estimated that the loconotive
 ailes ner hour.

As the train passed signal 1339 the fireman heard the oabmainal whistle sound until it was acknowledged by the
en-inom. At the sare time he hoard the sound of the exraust as tre carineer made a orake application. Fe dia not notice the len, tin of the exiaust. Wren the train reached a point about $\mathrm{J}, \mathrm{COO}$ leet south of the simal he obsorved that the spoed of ino tuain wes eacessire and at the sane the the englacer told hir that the brakes were not effective. He immodately oponcd the onergency brake valve on the fireman's side of tio control. ecmerattent. There vas no exhaust from the valve. He observca that the automotic bane valve was in emeremen position and the inciependent brake valve was in appliontion position. He then crossed to tho encineer's side of the contuol compartment and obsorved that the gaveres indior tod. thet the bukempipe nressure had teen ceplitea and that the brajompinlinder pressure was about 70 pounds. These are tinc norma indicutions after an emeraency application of tho inaires has boon vade. Tho l'ireman thought that the speed was betroon 35 and 40 rijes pex hour at the time tho locomotive structe tinc bumb ner post.

The conductor thnurtht thore was a brake application berone the trin roached "C" Intealockine, but as the train vas clooela approciniar tho intorlocking he beane atwre that the speed was 口ocosivo. Hu procoedod to the front Vestibule or tioc thisd cor and aftor he entered it re roard the solund of tien hom of tho locomotive. We immediately opened the concuatoris back-un ralve, but trocro was no exhaust and no approciaide redicuion in ared. Ee then returned to the interior ot tho thind con and waraod the pesscngers to remain in their sento and to ke prepased for an abrupt stop.

Who front brasoman procepded from the bageage compartrent to the persemor enmpentmentof the fourth cor as the troin wat arcoin" trough "C" Interlocking, When ho became avarc that tho god ras cxeessive ho proceeded to the roar vestibule wht tho inteation ot openir $\quad$ the conductor's back-up wlvo, but booneso of the lurching of the oar and his difstulty
 suoccoch in onenine tre valve bofore the acoident occurped. It Lis coverent trat re dia not.

The inonen was in the renn car and he first becamo awarc tixat the spoci was oxcessive when then oar movod through the ciosgnver at "X" Intillockine. At thret time he wos in the contor of the crr. Becauce of passonsers in the aisie Froprine tio lanve the tunin, ho wan unabe to reach the erereany $\because$ rive at cither nd of the car bcfore the acoidont oconvod, Neither tio front brixeman noi the ilagman hurd the soma re the pnoviditic horn of tiee locorotlve.
 3" of the train. Aust mets pasing tirougin "O" Interlociane
he noticer thet the speed wes excessive. He immeriately openef the emercency valve at the rear of the car. There ins no exheuat from the valve.

As lo. 273 vas pasaing "GH Interlockine the assistort troin director observed the $t$ it was moving much faster then usuri. Because of other movenents between the interloching station en? the track on which No. 175 was moving, he wes uneble to determinc whether there vere any indications th-t the brates of the troln wore apnlied. He 1mueniately informer tie train firsctor at "K" Intorlockirg that it apnearent douctful that tiee entineer of No. 173 would be able to stop the train short of a stop sicmal ot "K" Interlockinc. The trein djrector at "K" Intarlöcking instructed the levermon to IIne the route for the train to enter track No. 16, the rocularly assigned track for this train. The levermen lined the route for movement from siencl libgt to slenal legr and limet the suitches beyond amral 128 L for movemant to trocli io. 10. No. 173 pasced s.inal 12SL before the leverman had had time to cleas the si"naj. Tren the train director observed the speed at mich No. liph was annroching, the locomotive hed already entered the crossover ame there wes insurficient tine wo chenge the posithons of any of the switchos bevoni sienal 128L. He immaletely warned the employoes in the station master's offlos, mich is located near the stub end of trach No. 16, thet the train appenred to be out of control. He ohserved thet sperde rere ilyine, from the wheris am orrke shoes of the locomotive but was unable to aetcrmine whether the trans vere applied on the cors of tre trair:

Examination of the equiprant after the accident occurrea disclosed thet the enmaeer ves nuccessful in obtaming an emercency anplication of the brokes on the locomotive and the flrst thyee cers of the train but no effective breke aplice:ion wes obtained on the other cars. The treato of the wheels of the loconotive showed numerous sixd morks ond considerable hullt-un metal, fndicatirg thet the theels had recelvea very heavy braktng shortly before they stopped. The theels of the first three care vero extremely hot then the troin stopned. When the wheels rere examined between 1 hour and 1 hour 30 minutes later they repe found to bo unusually hot considering the lencth of time rhech had elapsed after the accidert occurred. There was eviAence of built-up metal on the treass and at the ribs of the wheels, and a number of the brake shoes were womn almost to the shoe heods. Globules of cooled molten metsl hanginw on the broke shoes and heads indicated that the brake shoes had been very hot. The frict thot there was no exnaust when the conductor's velve in the thiril car was opened also indicates the the
brake-plpe pressure had been depleted and an emergency applicetion of the brakes from the front of the train to end including the third cer had been obtalned at that tire. The wheeja end brike shoes of the fourth car and the cars behind the fourth car shovad no indicationa of recent obnommally hoovy browng. The flacran of No. 173 insoected the braires 2 an $^{\circ}$ the fofteonth and blxteenth cars smmediately after the troin stopped and rount thet they vere in releass position.

Shonty after the accident occurve? a yard eache wes coupled to the pear of the train, the air hose between the encine and the rear end of the rean car me counlen, and the ancle cocks betreen the encire and the rear cer oponed. The oncle cooks between the sixth an seventh cars were then closed ant the seventh to the sixteenth cars, Inclusive, vere removed. Ho test was mete to deterame the extent to ohich the air-brace syuter of the rear portion or the train wos charged priox to the tams the antle cocks betreen the yari encine ant the ronr cor were onenod.

Eetreen 20 ent 30 manutes ofter the yard oncine departed with the rear cars an empoyee otternten to separate the air hose betres: the thire en fourth sers. Te founl thet there wos a conciereble arount of fin prescure in the hose ont the arie coulc ros be separated easily. In order to relense the air prossuen, he onenert the eaercency walve at the front and of the fowth car. There wes a forceful exthust when he operied the yrive, and the owtes of the fourth, fifth, end sixth cars becere anolied. He tien discovered that the bandle or the angle cock at the rear enci of the third car had been moveá about 80 degrees from fully open position.

Another employec cut off the erf of the lroke pine ant the "U" bolt roouring the enfle cock to the supporilng bracket end removed the ancle cock from the car in on atterpt to maintain the hanile in the cosition in thach it was found. Povever, he dropied the ancle cock to the ground in the process of romoving it from the cor, and noprently the honile tas moved olther when tie ancle cock was aromped or then it was hendled after being removec. Tests of the angle cock after it ws remover disclosed thet the port onening was sufficient to permst the charging of the afr-brake aystem of seroral cars through the angie cock and to obtrin both service ard emergency bake emplications on these cers, Eefore No. 173 stonped, an erencency bretre andieation was obtained on the flust three cars, but no effective breise apulication was obtained behind the thire cor. After the yard.eneine and the rear 30 cars :rere Metachen, the air-braxe system of the fourth, fifthe and sixth cers roiained chnoged during a period of between 20 and

30 minutog. pursing this time tio brake nipe ahoed of the third car vas ouen. These rocts indicate thet the ancile cock at the zeaz of the whita ces wh closed befonc the tradin stopped and. tha the madio was motor betwen the tine $2 t$ ma first observe ant the thae the ample oock was testri ofter it was
 Ficht change in the poattion of the bndie mene a considerabis difference an the port openinc. With the hancle moved 50 cecrees form fuld onon posttion an emercenoy bunce eppleation bould be obiasmog through the angle cocha ant wht the konde woved 65 cegues from fulzy ones position the port was completedy wioser.

As the wreckece was boing removed, At wa found that the -1Fie cock wat broken off the ruar ent of the flrot err and $\therefore$ the horlowig latched in fully closer nosition. Howevon. St is evirent thet thes angle cock wia cjooed rs a result of belng atrub by weckage duadug the derailmont. The rear ent of the finst cor was consincrouly damace, end both the body and tho hande of the angle cook bore warks indionting thet they had been struck several afveje blows. If this angle cock haci been cloced before the derallment ocourren, the oneireer Would not hio becn suocessful 17 ottining an enemency brake arplication on tae second and third cars.

Artor tho fourth, fifth, and sixth cong were reratied, the renn lis ears of the train verc assembled in the order in prich they haci been assembled in No. 173 . In order to complets a l6wcar uadn, three coaches similer to the ilrst three cara of lio. 173 were substituten for the original first three cers. The angle cock wisloh had been removed from the reir end of the thira car was placed at the rear end of the rove third cer with the hande in that was thoucht to be tie position in which It wes found roliowine tho derolment. Ponore ras ro ricilculty an choreine the roar portion or thas trein throuch thes anole oock nox in m ing service ant emereency urace apulications. siter the airmbrahe system wes chereet to 170 mound pressure. 2. leakage test shoved that tile leana we was riproximatoly one pound Der manize. sincle-dar tests zisen were morio of ench of the rear 13 canc, ant tha brotas were fount to function proverly. Atter these tosta vere comploted, the atr hose, the armored banke-pipe hose, nac the brake-oyjinder hose :cre removen rron bach of tiou reni la cers, and the hose which were not damaged $\therefore s$ a rosult of tho derailment were removen from each of the chicinal first three cers. Inswotion discloned thet 211 of these hose vere in gooí contition ard free of obstruction. The automsse brake valve, tie feed valve, the indenendent brake volve, the rotair valve, the distributing velve, and the governor vere removed from locomotive 49.76 and placed on another locomotive of sinillar tyo, Theywere then tested and were found to function properly,

The angle cock at the rear end of the third car, wion was rome to be in clored position after the accident ocurad, had proviously been found in closed position while the trein was on routo from Eoston to Now Vork on the Now Haven. The train donerted from Eoston or Janciary 14 at 11 p . m., on timo. A temmal tost of the brakes was made before the train dopartod, and the brokes finctioned properly when used in controllune the speed at various points and in making station stops at Back ヨay, Mass., ind Providence, R. I., 1.28 end 45. 78 milos wost of Eoston, rospectively. The train ras stonped a short distance vost of Kinerston, R. I., 70.78 miles west of Eos bon, becouse the braices were sticring on the rear tro cars. Mon it was found that tho brores could not be rolranod from tinc locomotive, the enrineer made on inspection on the troin end discovored thet the nngle cock at the rear of the third on wis in rully closed posjetion. He oponed the encle cocir and jatchod it in that position ond the braxes tion runctionec pronerly, Locomotives were cinance and there cars acsod to the roar of the train at New Haven, Conn., 156. 31 miles from Eoston. The bires wree tested before doparturo and functionud proporly wnon used botreen Nev Favon and Fonncylvania station. There ras no ciance in the consist of tho unen at Ponngyvania Station axoent that the loov:otives worc chanco. Car inopectors sino inspcesta the train at Pennavivania station found no defeotive condition. Ther mide a routinc inspoction of the train and were certain tiat tioy vould fervo noticed any angle cock on which tho handle tras unletched on roved rron fully open position.

Aftor tho nocidont occurrod the anglo cock and air cose at tho rene ond of the thire car woro removed before the car wis oanainod thorouchly, Upon examination of the socond car, İev Aovo. 864b, wnicr wes of tho samo construction as tho thind car, it uns found that the nngle cocks were loorted ciarective under the cottom cross members of the bufer pocket pontioner of the mienframe end construction. The angle cocr suppontine brackets are rixidiv attached to and follow the Jonst tudinal, vertical and loteral novements of the coupler bodies. "th tine car uncounled ard the coupler at the undamecod end in normal couplang position the clearance botroen the top of the angie cook nancle and the bottom of the botton cross member of the burfer pociet wns 2 mehes and that boiween the top of the coupler head ond the bottom of the top cross member was $5-5 / 8$ inches. Becouse of this difremence in cloarance tho ancle cock hanrle was permitted to come in controt with the bottom cross member on uprand. movement of the coupler berore the coupler head would como in contect vith the top cross member. The ancle cock ros locatod dircoty under the bottor cross momber instead or $4-1 / 3$ incines bacir of the inside face of that member as specified by the

New Fivon. The coxpler, ingle cock braciret, and underframe ent co seruction at this end of the second car were not demafue during tho deraliment and there were no indications that tion agle cocinad be: yed as a rusult of the accident。

An ajrosion marl was foud on the top of the handlo Just obore the thomb reiease of the coible-locking ancle
 re.enlso - onnd on the buttom sjoe of the bottom cross momber,
 contect intir the cross mertor, Exanination of the wear end on the thura car disciusea abrasion mand on the bottom crose memor sirilan to na in ropanimatuly the same location as thoso on tho seconi car, kxamention of the angle cock rinich had boch rerovod fion tho ronr and of the third on after the accident cisclosed ren anosion on the ton of the handle similar to that found en tio angle cock ot the sicond car. There we ciac boresion meris showing thet the coupler heads of t.a socowe and thard cors hod been comine in contact with tho top crose membors of the buffer pociets.

The fourth cor ws equipped with conventional type compers rovins a vertical clearance of $5 / 8$ inch in the
 trucks of this car had a total deflection of 3.67 inches. Tne thire car we oculpped with timbtock couplers requiring a minn.... rertical clenrance of 3 inches above and 3 inches belor tine couplin* line nad was equippea witr 4-wheel trucks harina $=$ spring a smmby rith a total deflection of 7-13/16 inchers rine contrast in design of couplers and truck-spring assmblecs of ter Fiven onrs 8665 ond 6103 undoubtedly regul toa in e comedomble monease an the frequercy and intensity of oscilations and vibrations transmitted to the coupler body and tion $\because$ ttiched nigle cock at the rear end of car 8605 mile the troin wis in motion。

The abrasion rants on the hande of the angle cocl: and the botton cioss nemoer at the rear of eer 8655 show that the honcile had repentediy come in contact with the cross member. As the ande coch ras so located that contact could be rane while uio conylow body and the angle cock rere moviny vertjcolly and sither lonsituainally or latorolly, it is apparent thot as a iesult of these consacts the hande was unlatched and moved towna closed position a sixficient distance to close the angle cocine Tests reve made on a car of similar construstion by menully maniulating tise coupler rith a bar, and the handie of the on le cock vas movod toward closed position as a result of contact between the hande and the cross member.
