**SUMMARY OF ITEMS SUBMITTED BY THE AMERICAN AUTOMOBILE ASSOCIATION
FOR THE FEDERAL HIGHWAY ADMINISTRATION CASE STUDY ON SCENIC BYWAYS**

The History of AAA's Scenic Byway Program

A brief overview of AAA's 80 years of mapping and road inspecting experience detailing the causes for our interest in Scenic Byways, the data collection techniques and standards criteria that AAA uses to designate scenic routes, the map features developed over the last 20 years to depict the routes chosen and our vision for the future of the Scenic Byway program.

Scenic Byway Databases

Sample (DBase III) - A database containing most of the categories of information collected by AAA Road Reporters for each scenic route evaluated. These categories include route number, route name, terminal points, distance, AAA criteria (quintessential, natural beauty, cultural interest, uniqueness, public lands), SHAG evaluations (surface, shoulder, alignment, grade) and a short description of the features and scenery along the route. The 68 routes represent a more than 10% sampling of the North American roads designated by AAA as scenic.

Index of AAA Scenic Byways of the United States and Canada - A list of AAA's 631 scenic routes (including information on route numbers, road type, terminal points and distance) sorted by states and provinces.

AAA Scenic Byways Sorted by Road Type - The same list of AAA's 631 scenic routes - sorted by road type (Interstate, U.S., State, County, Provincial, Autoroute and Other).

Reports

AAA Scenic Byway SHAG Report - A breakdown, by state, of the evaluations on each SHAG category for each of the 68 sample routes.

SHAG Percents by Category - A matrix of the percentage of the sample scenic roads that falls in each of the ratings (Excellent to Poor) for each of the SHAG categories.

Road Reporter Guidelines

Procedures for Reporting Scenic Routes - The guidelines from the Road Reporter Procedures Manual for filling out the Scenic Route Report Form.

SHAG Criteria - The guidelines for each of the ratings (Excellent to Poor) for each of the SHAG categories.

April 19, 1990

The History of AAA's Scenic Byway Program

Early Efforts

AAA has been producing its own maps since 1910. From the beginning, these maps were produced from first hand knowledge of the roads - gathered by AAA Pathfinders who drove the country's roadways and collected information on road conditions, signing, mileage, time and direction between cities.

Over the years, AAA received appeals from both members and affiliated clubs to put favorite scenic roads on the maps, and to note them accordingly. These requests were dealt with on an ad hoc basis.

In the late 60's and early 70's, the AAA Cartographic Department embarked on a complete redesign of AAA's state, regional and strip maps. The plan was to incorporate into the new maps those features that AAA members felt were important. In addition to symbols pinpointing the location of local AAA clubs, points of interest and AAA-approved hotels and restaurants, information concerning Scenic Routes was included for the first time in a standard text supplement on each map.

AAA Scenic Byway Program

In 1979, AAA began to lay the groundwork to expand this coverage to include a symbol pinpointing exactly which sections of road were considered scenic. The AAA Road Reporters, the modern day equivalent of the Pathfinders, produced a set of criteria for the selection of Scenic Routes. The four categories developed reflected the different facets of highway scenery that the Road Reporters felt characterized Scenic Routes.

Quintessential represented the best of the characteristic features or scenery of a state or region. **Natural Beauty** sought to define the most strikingly beautiful scenery for natural features such as mountains, rivers, canyons, forests, etc. **Cultural Beauty** represented a particularly pristine or well preserved scenic route through essentially man-altered terrain featuring economic, historic or architectural activity. **Unique** categorized a limited area that is unique to the region such as geothermal features, redwood or rain forests, atypical desert terrain, etc.

Beginning with the 1983 edition, AAA's state map have featured these Road Reporter selected routes delineated by a series of black dots. In the course of their normal road canvassing (approximately 200,000 to 250,000 miles a year), the Road Reporters have periodically sampled these routes to add, delete or alter the scenic route designations as needed. AAA's clubs have also provided valuable information about potential new scenic routes for the Road Reporters to evaluate before application to the maps.

The History of AAA's Scenic Byway Program (cont.)

Data Collection Techniques

Typically, Road Reporters drive the roads from end to end making notes while they travel. The notes include the odometer and time readings logged at road crossings or when passing towns and features; route signing information; MPH data; road condition information (surface, shoulder, alignment and grade - rated on a 1 to 5); traffic data (also rated 1 to 5); and descriptions of the general scenery and specific features found along the route.

On occasion, Road Reporters will "log off" the road to visit local highway departments, chambers of commerce and visitor centers and to take pictures and collect data on local attractions. Perishable information is reported to AAA headquarters via weekly mailings. The rest of the information is disseminated to AAA cartographers when the Road Reporters return to the office after their 2-3 month trip.

Scenic Byways Initiative

In 1988, AAA became actively involved in the national effort for a Scenic Byways initiative - providing technical support and travel-related expertise at various meetings and conventions that eventually lead to the introduction of the Scenic Byways Study Act of 1989. As a consequence of this activity, AAA added a fifth category to its Scenic Route criteria. **Public Lands** defines those roads selected and signed by government agencies with established Scenic Byway programs (Forest Service and BLM). AAA added these routes to its 1990 edition maps if the Road Reporters determined that the route could be traveled by a typical family sedan vehicle.

AAA has continued to support the process of Scenic Byways initiative advancement by meeting with Kevin Heanue of the Federal Highway Administration in February, 1990 to provide a detailed account of AAA's Scenic Byways procedures, guidelines and information gathering techniques. Information exchanged at that meeting lead directly the AAA Cartographic Department's involvement with the FHWA to provide the additional data on surface, shoulder, alignment and grade conditions for 10% of the approximately 650 roads designated as scenic by AAA.

At present, the AAA Highway Information unit is expanding the procedures for Scenic Byway coverage. The intent is to regularly and routinely drive currently designated and potential new Scenic Byways to collect more pictures of the scenery, to systematically report detailed data on the roads and to canvass the entire inventory at least once every 2 to 3 years. The information will be stored in electronic databases for easy retrieval. The pictures will be cataloged for use on AAA's maps, TourBooks and any special Scenic Byways booklet that may be developed.

The History of AAA's Scenic Byway Program (cont.)

Objectives

The American Automobile Association's goal in developing this wealth of information on Scenic Byways and the guidelines to designate them is to provide the standard by which Scenic Byways are selected and maintained. It is in the motoring public's best interest that high standards be maintained in designating Scenic Byways and that jurisdictions be required to upgrade roads with safety features such as pullouts and adequate shoulders and vistas if potential routes are lacking them. AAA intends to be in the forefront of the pending debate over the shape of the nation's Scenic Byways program.

Information on these pages is the property of the American Automobile Association and can only be used if AAA is credited in each and every publication where this information is used and AAA is provided with copies of those publications.

PROCEDURES FOR REPORTING SCENIC ROUTES

I. Preparing a Coverage

- A. Select at least 6 scenic routes in your coverage area and add them to the list of routes to cover, keeping the following guidelines in mind:
 1. The 6 scenic routes should be in addition to the scenic routes that your original trip would have covered in any event.
 2. Specific request for coverage (new or existing) should be added first.
 3. The oldest existing scenic routes should be added next.
 4. Scenic routes that most easily fit into your coverage area without adding too much "deadheading" can be added to round out the prescribed number of routes.
 5. Include at least 10 miles of coverage on either side of a scenic route (unless it is a circle or loop route) to access the scenery before/after a scenic portion, for contrast or possible addition to the scenic route designation.
 6. While preparing your coverage routing and especially while driving the area, keep an eye open for new scenic route designates and make a report on these roads as well.
 7. Plan to travel the route in reverse (immediately after logging it in the first direction) if practical. (See instructions in II-B)
- B. Make a copy of the last Scenic Route Report Form for each of the routes already covered (**originals are to be kept at Headquarters**) and enough blank forms for all anticipated routes and to cover any unanticipated routes.

II. Logging the Route

- A. Log the route as you would a normal coverage and write your observations in your notebook. The scenery observations should be in more detail than for your usual coverage. Other special notations should be:
1. Special Signing and its location
 - a. Scenic-Route-Specific signs
 - b. International signs
 - c. Pullout signs
 2. Vistas (expansive or distant views) and their location.
 3. Pullout locations and whether special information relating to scenery is provided at these locations.
 4. Parkway-like roads
 - a. landscaped medians and banks
 - b. natural shoulders (pavement to grass rather than pavement to gravel)
 - c. rustic guard rails and/or fences (stone, wood, etc.)
 - d. special lanes (for safe turn to pullouts)
 5. Corridor Features - generic feature(s) of a particular route (e.g. mountains, rivers, mesas, desert, farmland, ranchland, historic sites, etc.)
 6. Photo opportunity locations
 - a. scenery
 - b. landmarks (buildings, historic items, etc.)
 - c. signs
 - (1) regular signs
 - (2) special signs (see II-A-1)

7. Anomalies - Portions of the route, usually passing through towns, where the ambiance of the scenic road is temporarily broken because of:
 - a. unsightly commercial strips
 - b. visible junkyards
 - c. disheveled buildings
 - d. limited sight area
 - e. termination of signs or other standard features found on most of the route.
8. SHAGS - (Surface, Shoulder, Alignment, Grade) should be noted as follows:
 - a. at the beginning, middle and end of each route.
 - b. where any section(s) of the route changes.
 - c. to provide an overall average for a given route.
 - d. if the route is too short or consistent to provide high, middle and low shags, then this should be noted.

* Refer to SHAG CRITERIA for grade definitions.

B. Second sweep of road - In most instances, the scenic route should be traveled in both directions on the same day. This allows for the unbroken driving of the scenic route in the first direction so the route can be experienced as a whole. On the second sweep, a more in depth study of the road can be accomplished.

1. Second Sweep Functions

- a. Vistas - are they substantially the same as in the first direction?
- b. Pullouts - is there equal access to them from both directions?
- c. Photo Opportunities - photographs should be taken at this time and noted at what section(s) of the scenic route they were taken.
- d. Attraction Visits - attractions that are part of the scenic road experience should be visited.

- e. Local intelligence data collection - local sources such as brochures, newspapers, talks with park rangers or local residents, etc., should be collected/canvassed to determine:
 - (1) scenic route appellation (official or local usage)
 - (2) historic facts of the road.
 - (3) future plans for the road.
- 2. Exceptions - If a second sweep is not possible, do as many of the second sweep functions on the first pass through as practical. The exceptions for performing a second sweep are:
 - a. When the scenic route is part of the regular coverage (particularly when a return trip on the same road in the opposite direction can be planned for later in the coverage).
 - b. When the scenic route is more than 50 miles long and is not a circle or loop.
 - c. When weather conditions preclude the type of in-depth, out-of-car activity prescribed for the Second Sweep Functions.

III. Making a Report

- A. The Scenic Route Report Form should be filled out the day of the coverage as follows:
 - 1. Subject - Write the name or route number(s) for the scenic route (e.g. Blue Ridge Parkway, US 101, SR 9/SR 119/SR 2A)
 - 2. State/Number/Year/Revision - Revise this code information from the previous report. For new reports, create the code as follows:
 - a. State - 2 letter, standard mailing code for the state or province in which the scenic road appears (e.g. Alabama = AL, Saskatchewan = SK). Note: If scenic route traverses more than one state, select the prominent state. If both are of equal length, make two reports.
 - b. Number - 2 digit number assigned to track the number of scenic routes in each state. Note: For new routes, leave this space blank to be filled in at Headquarters.

- c. Year - last 2 digits of the report year.
 - d. Revision - one letter code indicating the number of times the route has been run. (e.g. 1st run = A, 2nd run = B, etc.)
3. Date - The date that the route was logged. If it was run on separate dates, write both dates separately.
 4. Reporter - Sign Report Form.
 5. Start Jct/Finish Jct - Indicates the junction that best exemplifies the beginning and the end of the scenic route (in the first direction). Some guidelines for junction selection are:
 - a. End of named portion (e.g. Natchez Trace; Tennessee).
 - b. End of number route followed (e.g. SR 100; Vermont).
 - c. End at park boundaries (e.g. New Found Gap Road, Great Smoky Mountains N. P.; Tennessee).
 - d. End at town (e.g. SR 2A; Lexington, Mass.).
 - e. End at junction (e.g. PR 29 at Jct PR 97; near Ft. St. John, B.C.).
 - f. End at milepost (e.g. Alaska Hwy; near Ft. Nelson, B.C.).
 6. Anomalies/Reasons - Small portions of the road that do not meet criteria and the reason that they do not. (See II-A-7).
 7. Appellation - The name that either the road or region is known by if this can be determined with a reasonable degree of certitude. (e.g. Pennsylvania Dutch Country, Bayou District, Texas Hill Country, etc.)
 8. Mileage - The distance for the entire length of highway between the start and finish junctions.
 9. Categories - Circle the number(s) of the scenic categories that apply for this particular route. Indicate a primary choice if more than one category applies. (Refer to brochure addendum for route examples of each category).

- a. **Quintessential** - "best of the characteristic features or scenery of a State or region". This is the category in which we rely almost entirely on Road Reporter input to select. We are looking for a golden nugget of a road, unheralded by reputation or promotion, that best represents a particular state or region.
- b. **Natural Beauty** - "strikingly scenic natural features - canyons, rivers, mountains, deserts, forests, mesas and shoreline scenery". This category is self-explanatory but the key word is striking. There should be something that sets it apart from the same kind of scenery nearby.
- c. **Cultural Beauty** - "architectural, historic or economic activities, farming, ranching, fishing villages". These types of routes are either distinguished by park personnel involvement or by a reputation that precedes the actual tour. The scenic route should be the portion of these areas that is the most concentrated or the best laid out of these features.
- d. **Uniqueness** - "usually a limited area that is unique to the region but differs from the general scenery". Reserved for those routes that pass a feature that - while not necessarily strikingly beautiful - is unique enough to be a draw in itself. The road itself should be one in which the unique feature is presented in a pristine fashion.
- e. **Public Lands Scenic Byways** - "byways designated by agencies of the Federal Government". A growing number of Federal Government Agencies (besides the National Park Service) have been designating and signing sections of roads in their disparate jurisdictions as Scenic Byways. AAA will designate these as scenic routes if:
 - (1) they are well signed and trailblazed and
 - (2) they can be negotiated with little difficulty by a standard, American-made, family sedan vehicle.
 - (3) they meet basic scenic route standards. Programs now in effect include:
 - (a) U.S. Forest Service - "National Forest Scenic Byways"

(b) Bureau of Land Management - "Back
Country Byways"

10. Corridor Features - (see II-A-5).
 11. Descriptive - A general description of the route that should include the following points:
 - a. Reasons why the route should or should not be designated as scenic.
 - b. If a route does not qualify, list the main areas of non-compliance.
 - c. If a route does qualify, list its strongest attributes.
 - d. Reasons why a certain category was selected.
 - e. General description of how the scenery changes as the route is driven (particularly important for anomalies).
 - f. A confirmation that vistas and pullout access are available in both directions or a description of how they differ.
 - g. Any future plans for change along the route (if any), or any other information that you deem important.
 12. Pictures (should be taken)
 - a. Numbers - will be filled in at Headquarters.
 - b. Description
 - (1) Short description of feature pictured.
 - (2) Town, road or milepost information that will accurately locate the place where the picture was taken.
 - c. Date - Date (and time, if this information is important) that the picture was taken.
 13. Highlighted Map - Attach a map to the back of the form with the section of the road deemed scenic highlighted.
- B. Mail the completed Scenic Route Report Form for each route to the Highway Information Unit of National Headquarters with the weekly report. Once back in the office, process a copy of all the pictures that were reported on the forms and give them to the appropriate Highway Information personnel.

SHAG CRITERIA
(Definitions for SHAG grades)

- S=Surface** Poor (5) = A surface which makes it almost impossible to write legibly due to "washboard" effect or pothole dodging. The surface will have; numerous potholes, weather heaves, uneven joints, patches, extremely worn or rutted pavement with breaks, etc. Reduced speed is necessary.
- Fair (4) = Surface with several rough areas which may consist of potholes, weather heaves, worn or rutted areas, all of which may be interspersed with smooth pavement. The surface may also consist of smooth pavement in some areas but will have abrupt rough spots on a regular basis.
- Good (3) = Mostly smooth pavement with an occasional rough spot or worn slick area. It is usually easy to write legibly and it usually will provide an easy, comfortable driving surface. The surface may also consist of very smooth pavement but will have a few spots which will keep you on your toes when you are writing because of the rare rough spot.
- Very Good (2) = Very smooth surface, with a rare bump or vibration, providing effortless driving. Writing is never really affected and driving is very easy and enjoyable. The surface may also consist of almost perfect surface with only the slightest in surface distortion.
- Excellent (1) = This classification is reserved for only those surfaces which are visibly newer and evenly spread, usually a new highway or newly resurfaced highway. Logging information can be done as neatly as if you were sitting at an office desk.
- H=Shoulder** Poor (5) = Poor shoulders consist of the following: Shoulder is nonexistent. Guardrail or grass abuts with the pavement of the road surface with a large drop off. No chance or opportunity to pull off road and be safely out of on-coming traffic's way.

- Fair (4) = Provides 18 inches or less of pavement for shoulder or has a severe drop off from pavement in which damage to the vehicle may occur. Cars attempting to use shoulder would still be partially hanging onto the highway or be unable to return to the highway safely. Includes some "soft" shoulders, such as sand.
- Good (3) = A shoulder where you can usually pull off with relative ease. The shoulder can consist of either well maintained grass, gravel, or a paved shoulder which has become deteriorated, but for the most part is in usable shape. Space is barely adequate to move around the car freely without interference from on-coming traffic.
- Very Good (2) = A well maintained paved shoulder at least on the right side of the highway (if the highway is a divided or controlled access highway). Wide, smooth surface free of debris. The shoulder is of such quality that it could be used for a travel lane if necessary. Provides extra amount of room for safe vehicle maintenance.
- Excellent (1) = A shoulder which is of excellent surface, and width, and provided on both sides of the highway when possible. The shoulder is of like quality to the highway surface which would have to be in the very good to excellent range. Provides room for RV or truck to safely pull off the highway.
- A=Alignment** Poor (5) = "Switchback" roads which are extremely winding, narrow and create a white knuckle grip on the steering wheel. Usually going through mountain terrain. Safe driving speed is usually 25 m.p.h. or less. Views of on-coming traffic are under 50 feet. No passing is possible on two-lane roads. Hard to stay in correct lane.
- Fair (4) = Winding alignment with numerous turns and curves. Requires a good deal of concentration because the road is always changing direction. Some straight areas, but will be mostly winding. Visibility of on-coming traffic is increased from poor designation, but still hindered by hills, cliffs, forests or other obstructions. Passing on two-lane roads is extremely difficult and dangerous and can be accomplished only rarely.

- Good (3) = Relatively straight road with a few winding sections that require minimal driving effort. Views will usually be uninterrupted for some distance and logging will be accomplished with ease. Passing on two-lane roads can be accomplished if timed properly.
- Very Good (2) = Mostly straight with a few sweeping curves. Long uninterrupted views down the highway and little movement in the steering wheel. Passing on two-lane roads is almost constantly possible.
- Excellent (1) = Straight as a ruler with no curves of any kind for long distances (several miles). Will almost cause boredom when driving. No difficulty at all logging. Passing on two-lane roads is as easy as passing on divided roads - assuming that on-coming traffic cooperates.
- G=Grade** Poor (5) = Down-grade will really test brakes. Usually provides runaway truck ramps. Requires special attention when driving. If allowed to coast, the car will increase speed to a dangerous level very quickly. Upgrades will cause strain on engine and speed will not be able to be maintained. Truck or "creeper" lanes for slow moving vehicles are frequently provided.
- Fair (4) = The use of brakes is frequent on down-grades. May provide runaway truck ramps. If allowed to coast, car speed would continue to increase to a dangerous level. Upgrades will be steep enough to cause some engine strain and cruise control will be unable to maintain speed. Several short up and down hills over a short distance. Creeper lanes are sometimes provided.
- Good (3) = Some rising and falling grades, usually in hilly to rolling terrain. Mostly uninterrupted views down the highway. The engine is minimally strained on up grades. Cruise control will be able to maintain speed for both rising and falling grades on most occasions. Can allow car to coast with little or no speed increase. Grades may be very slight in some areas but the overall grade still has areas of up and down.

Very Good (2) = Very slight grades both rising and falling. Mostly gently rolling to flat terrain. Almost no noticeable change in the performance of the engine when going up a grade and cruise control can effectively maintain vehicle's speed at a constant pace. If allowed to coast on a down-grade the speed will usually decrease.

Excellent (1) = Flat as a table top. Totally uninterrupted views. You can see to the horizon. No rise or fall of any kind or at least almost not noticeable.

Index of AAA Scenic Byways of the United States and Canada

Current Date- 04/20/90
Last Date- 12/14/89

Guidelines used by AAA Road Reporters for selection of Scenic Byways:

1. Quintessential - best of the characteristic features or scenery of a state or region.
2. Natural Beauty - strikingly scenic natural features e.g. canyons, rivers, mountains, deserts, forests, mesas, shorelines, etc.
3. Cultural Interest - architectural, historic or economic activities, farming, ranching, fishing villages, etc.
4. Unique - usually a limited area that is unique or unusual to the region and differs from the general scenery e.g. geothermal features, redwood forest, rainforest, Great Salt Lake, Overseas Highway, etc.
5. Public Lands - areas on public land designated by agencies of the Federal Government: Park Service, Forest Service or Bureau of Land Management.

NOTE: In most cases, expansive and/or distant views would be a key element in selecting a specific segment of road over another.
