FORECAST HIGHLIGHTS

2013-2033

Since the beginning of the century, the commercial air carrier industry has suffered several major shocks that have led to reduced demand for air travel. These shocks include the terror attacks of September 11, skyrocketing prices for fuel, debt restructuring in Europe and the United States (U.S.), and a global recession. To manage this period of extreme volatility, air carriers have fine-tuned their business models with the aim of minimizing financial losses by lowering operating costs, eliminating unprofitable routes and grounding older, less fuel efficient aircraft. To increase operating revenues, carriers have initiated new services that customers are willing to purchase. Carriers have also started charging separately for services that were historically bundled in the price of a ticket. The capacity discipline exhibited by carriers and their focus on additional revenue streams bolstered the industry to profitability in 2012 for the third consecutive year. Going into the next decade, there is cautious optimism that the industry has been transformed from that of a boom-to-bust cycle to one of sustainable profits.

As the economy recovers from the most serious economic downturn and slow recovery in recent history, aviation will continue to grow over the long run. Fundamentally, demand for aviation is driven by economic activity. As the economy returns to growth, so will aviation. The 2013 FAA forecast calls for U.S. carrier passenger growth over the next 20 years to average 2.2 percent per year, compared to last year's forecast growth of 2.6 percent per year. After another year of slow or no growth this year, growth over the next five years will be slightly higher than the long run rate as we assume the U.S. economy grows at a faster rate. This delayed trajectory represents the downward adjustments of the overall economy, here in the U.S. and abroad, and of the aviation sector response. One of the many factors influencing the delayed recovery is the uncertainty that surrounds the U.S. and European economies. The latter, primarily those belonging to the Euro area, have been hit hard by the pressure for fiscal austerity. Combined with the slow pace of these economies, debt restructuring pulled the European economy into recession in early 2012, where it continues to languish today. This has not helped the pace of U.S. economic growth given the importance of its trade with Europe. Despite this and the ambiguity surrounding its own fiscal imbalances, the U.S. economy has managed to avoid a double dip recession and trudges along the path of slow recovery.

System capacity in available seat miles (ASMs) – the overall yardstick for how busy aviation is both domestically and internationally – is projected to shrink by 0.1 percent this year after posting a 0.1 percent increase in 2012; it will then grow at an average annual rate of 2.9 percent through 2033. In the domestic market, capacity growth hovers around zero for the second year in a row. Domestic capacity is projected to grow at an average annual rate of 2.1 percent for the remainder of the forecast period. Domestic mainline carrier capacity will not increase in 2013 after increasing 0.7 percent in 2012. For the regional carriers, domestic capacity growth is also projected to be flat in 2013 after declining 4.3 percent in 2012. Commercial air carrier domestic revenue passenger miles (RPMs) are forecast to increase 0.7 percent in 2013, and then grow at an average of 2.2 percent per year through 2033; domestic enplanements in 2013 will decrease 0.1 percent, and then grow at an average annual rate of 2.0 percent for the remainder of the forecast.

The average size of domestic aircraft is expected to increase by 0.4 seats in FY 2013 to 124.3 seats. Average seats per aircraft for mainline carriers are projected to stay relatively flat as network carriers¹ continue to reconfigure their domestic fleets. While demand for 70-90 seat aircraft continues to increase, we expect the number of 50 seat regional jets in service to fall, increasing the average regional aircraft size in 2013 by 0.5 seats to 57.7 seats per mile. Passenger trip length in domestic markets will increase by 7.2 miles during the same period.

Although the slow growth of the U.S. economy and the European recession has dampened the near term prospects for general aviation, the long-term outlook remains favorable. We see growth in business aviation demand over the long term driven by a growing U.S. and world economy especially in the turbo jet, turboprop and turbine rotorcraft markets. As the fleet grows, the number of general aviation hours flown is projected to increase an average of 1.5 percent a year through 2033.

The global economy is facing a prospect of slow growth in 2013 with continued recession in the first part of the year in Europe which has slowed the demand for air travel. Profitability for U.S. carriers will hinge on a stable environment for fuel prices, an increase in demand for corporate air travel, maintaining the ability to pass along fare increases to leisure travelers, and the continual generation of ancillary revenues. To navigate this volatile operating environment, mainline carriers will continue to drive down costs by better matching flight frequencies and/or aircraft gauge with demand, delaying deliveries of newer aircraft and/or grounding older aircraft, along with pressuring regional affiliates to accept lower fees for contract flying. Over the long term, we see a competitive and profitable aviation industry characterized by increasing demand for air travel and airfares growing more slowly than inflation, reflecting over the long term a growing U.S. economy.

¹ Alaska Airlines, American Airlines, United-Continental Airlines, Delta Airlines, and U.S. Airways.

REVIEW OF 2012

Although the year 2012 began with a lot of hope for an economic recovery, it was primarily characterized as a year of full scale uncertainty. Despite the uncertainty in the operating environment, the changes that U.S. carriers have made since the start of the global recession in 2008 helped the industry to make a profit for the third year in a row. Many industry professionals see these changes as providing traction towards profitability, even during future periods of uncertainty. The biggest change that U.S. passenger airlines have made is the shift in focus from increasing market share to one of boosting shareholder return on investment. The U.S. airline industry has become more nimble; that is, adjusting capacity to seize opportunities or contracting in times of economic distress. As a result, it expanded its capacity by 0.1 percent in 2012 while positioning itself for a reduction of 0.1 percent this year in anticipation of the uncertain economic environment. Even during times of economic instability and distress, the industry has found ways to increase revenue. For example, air carriers are charging fees for services that used to be included in airfare (e.g. meal service), as well as for services that were not previously available (e.g. premium boarding and fare lock fees). The impact from these recent initiatives gives reason for optimism as the industry (passenger and cargo carriers combined) posted profits for the third consecutive year in 2012.

Demand for air travel in 2012 grew slowly following a relatively strong 2011 that was highlighted by improving consumer confidence and falling unemployment, despite continuing pressure of debt restructuring in Europe and the U.S. In 2012² system revenue passenger miles increased 0.9 percent as enplanements increased 0.8 percent. Commercial air carrier domestic enplanements were up 0.6 percent while international enplanements were up 2.4 percent. The system-wide load factor continued to rise to 82.7 percent (up 0.7 points from 2011). Domestic enplanement market share continued to rise for low-cost carriers in 2012 while network and “other” carrier and regional carrier share decreased. Domestic low cost carrier enplanement share increased by 0.7 points to 29.1 percent while the share of network and “other” carriers fell by 0.2 points to 46.6 percent and regional carrier share dropped by 0.6 points to 24.3 percent.

Capacity restraint by the carriers as helped the system wide real yield to increase by 2.4 percent in 2012. Data for FY 2012 show that the reporting passenger carriers had a combined operating profit of \$6.0 billion (compared to a \$5.7 billion operating profit for FY2011). The network carriers reported combined operating profits of \$4.2 billion while the low cost carriers reported combined operating profits of \$1.3 billion, with four out of the five network carriers and seven of the nine low cost carriers posting profits.

The general aviation market showed an improvement especially by robust contributions from the agricultural airplane segment of turboprops and strong growth in the rotorcraft sector. When revised data became available about the agricultural aircraft, the recovery was tracked back to 2011, which continued in calendar year (CY) 2012, which saw deliveries post a 3.3

² All stated years and quarters for U.S. economic and U.S. air carrier traffic and financial data and forecasts are on a fiscal year (FY) basis (October 1 through September 30). All stated years and quarters for international economic and world traffic and financial data are on a calendar year (CY) basis, unless otherwise stated.

percent increase. The new data revealed the U.S. manufacturer shipments in fact increased by 9.8 percent in 2011, while U.S. billings initially increased by 5.0 percent in 2011, but recorded a decline of 3.0 percent in 2012. Single engine piston shipments recovered from their negative trend to a 0.9 percent increase over the previous year. However, due to declines in the multi-engine category, total piston aircraft shipments by U.S. manufacturers were relatively flat, with an estimated increase of 0.3 percent. Turbine aircraft shipments (turboprop and business jets) by U.S. manufacturers increased by 6.2 percent in CY 2012 compared to CY 2011. Turboprop shipments, which increased by 16.2 percent in 2012 accounted for the growth in turbine shipments, as there was a 4.7 percent decline in shipments of business jets, which had ceased the previous declining trend in turbine aircraft shipments in 2011. This was a reflection of the fragile nature of the economic recovery, even though there are promising technological developments for the future the pace of the decline has slowed. General aviation activity at FAA and contract tower airports was in line with the shipments with an increase of 0.6 percent in 2012, driven by local operations.

Total operations at FAA and contract towers decreased for the 5th consecutive year, falling 0.3 percent, as activity declines in the air taxi and military categories offset increases in air carrier and general aviation activity. Large hub facilities saw activity fall by 0.8 percent, while medium hubs posted a 3.8 percent decline. Activity at small and non-hub airports rose by 0.5 percent, the first increase in activity since FY 2007. Although the overall number of flights fell, FAA's workload did not. With increasing numbers of regional and business jets in the nation's skies, fleet mix changes, and carriers consolidating operations in their large hubs, we expect increased activity growth which has the potential to increase controller workload.

U.S. ECONOMIC ACTIVITY

Following an unprecedented fiscal stimulus (i.e., American Recovery and Reinvestment Act or ARRA) of over \$800 billion that took place in 2009, with over half of it being spent during 2010, the U.S. economy was left to its own fundamentals in 2011 and 2012. The economy grew at an average annual rate of 1.8 percent in fiscal year (FY) 2011 and 2.2 percent in FY 2012. Given the uncertainty that characterized 2012, the economic growth that occurred without a contraction or double-dip recession was reassuring. While the economy appeared to be picking up steam in the end of FY 2011, growth slowed in the first half of the year before softening further in the 4th quarter as uncertainty over the “fiscal cliff” coupled with the impacts from Hurricane Sandy reduced demand. Despite the slow growth there were some favorable signs in the data as the housing market appeared to be finally turning around and the labor market gained traction.

**U.S. Gross Domestic Product
Seasonally Adjusted Annual Growth**

One of the most obvious impacts of the recession has been reflected in the nation's unemployment rate. When the recession began in December 2007 the unemployment rate was 5.0 percent, and reached its pinnacle during the fourth quarter of FY 2009 (9.9 percent). The unemployment rate has been gradually falling since that time, averaging 9.7 percent in FY 2010, 9.2 percent in FY 2011, and 8.3 percent in FY 2012. .

U.S. Unemployment Rate

The price of oil, as measured by the U.S. Refiners' Acquisition Cost (for West Texas Intermediate, or WTI), was \$102.71 in FY 2012, an increase of 6.9 percent from FY 2011. Since FY 2009, the refiner acquisition cost of oil has risen by 88 percent. The fuel price volatility that characterized 2008-2009 has diminished considerably but a rising trend appears to be settling in throughout the last two years.

U.S. Refiners' Acquisition Cost

Finally, consumer prices continued to increase in 2012. Core inflation (excluding gas and food) was moderate (2.2 percent); while headline inflation was up 2.4 percent due to a 3.3 percent increase in food prices.

WORLD ECONOMIC ACTIVITY

Based on preliminary figures, according to IHS Global Insight, the U.S. and rest of the world economies grew 2.1 and 2.2 percent, respectively, in 2012. The advanced economies (U.S., Western Europe, Japan, Australia, New Zealand, and Canada) expanded 1.1 percent overall. All world regions saw their economies grow, including Japan even though it is still recovering from the devastation wrought by the earthquake and tsunami in 2011. China was still the world leader in economic growth followed by India and Mexico. Data coming out at the year's end suggest that the recovery in Europe is continuing to lag that of other world regions.

Source: IHS Global Insight, GDP Components Tables (Interim Forecast, Monthly), Release date 23

On a calendar year basis, gross domestic product (GDP) in Canada expanded at the same pace as the U.S. (up 2.1 percent, respectively) in 2012. The combined economies of the Asian and Far East nations grew 4.2 percent in 2011, down only .1 percent from a year earlier. This region includes the world's second largest economy, Japan (up 1.7 percent), and the world's most vibrant economy, China, which shows some signs of slowing down (10.5, 9.3, and 7.6 percent, respectively, for 2010, 2011, and 2012). The combined economies of Europe have stalled, with Western Europe (excluding Turkey) down 0.2 percent overall and the combined economies of Central Europe and the former Soviet Union up 2.5 percent. GDP in Latin America (including the Caribbean) expanded by 3.2 percent with Mexico up 4.0 percent. The largest economy in the region, Brazil, appears to be suffering through a slowdown in growth

with GDP expanding only 1.5 percent in 2012, following gains of 7.5 and 2.7 percent, respectively, in 2010 and 2011.

COMMERCIAL AVIATION

Commercial aviation continued a slow recovery in 2012 despite rising jet fuel prices and a shaky global economy. The U.S. industry posted a net profit in 2012, with a similar outcome predicted for foreign carriers. After posting net profits of \$8.8 billion in 2011, global industry net profits for calendar year 2012 are expected to be \$6.7 billion.³ All global regions except North America and Latin America are projected to see a drop in profits as fuel costs increased by \$33 billion worldwide.

World Travel Demand

Based on data compiled by the International Civil Aviation Organization (ICAO), world air carriers are expected to post another moderate growth performance in CY 2012 as demand for air travel continues to recover from the depressed levels recorded during 2009. Although traffic results are not available for full year 2012 at the time of this printing, ICAO predicts that worldwide revenue passenger kilometers (RPKs) will increase 5.5 percent, a 0.9 percentage point decrease compared to last year's growth rate.⁴

World Passenger Demand (International and Domestic)

Source: RPKs (ICAO); Pax (2009-11 ICAO, 2012 IATA)

³ IATA Financial Forecast, December 2012.

⁴ ICAO press release dated December 18, 2012, COM 30/12.

Statistics from IATA, available for calendar year 2012 show passengers are up 5.1 percent over calendar year 2011. Data for the same period shows capacity, as measured by available seat kilometers (ASKs), to be up 4.0 percent and RPKs to be up 5.5 percent.

European Carriers Capacity and Traffic Calendar Year 2012

The Association of Asia Pacific Airlines (AAPA) reported an increase of 5.8 percent in international RPKs and a 3.9 percent increase in international ASKs; international passengers were up 7.0 percent during the same period.⁵

Asia Pacific Carriers Capacity and Traffic Calendar Year 2012

⁵ Association of Asia Pacific Airlines, "Asia Pacific Full Year 2012 Traffic Results", Press Release dated 30 January 2013, Issue 2013: 03.

In CY 2012, U.S. and foreign flag carriers transported an estimated 171.8 million passengers between the United States and the rest of the world, a 3.7 percent increase from 2011. Year-over-year growth occurred in all markets (up 1.6, 5.6, 5.2, and 2.7 percent, respectively, for Atlantic, Latin America, Pacific, and Transborder). Passenger levels in the Atlantic market have stagnated due to repercussions from the debt crisis in Europe, the worldwide economic slowdown, and congressional impasse over the U.S. budget.

Total Passengers To/From the U.S. U.S. and Foreign Flag Carriers

Source: US Customs & Border Protection data processed and released by Department of Commerce; data also received from Transport Canada

Worldwide air cargo demand fell for the 2nd consecutive year in 2012. According to IATA, worldwide freight ton kilometers were estimated to decline 2.0 percent in calendar year 2012 compared to 2011. Freight ton kilometers (FTKs) of AEA member carriers fell 3.4 percent in calendar year 2012 as did the FTKs of AAPA member carriers.

Source: IATA

The International Air Transport Association (IATA) reports that world air carriers (including U.S. airlines) are expected to register an operating profit of \$13.6 billion for 2012. IATA estimates global airline industry net profits to be \$6.7 billion for the same period with all regions expected to be in the black. Based on financial data compiled by ICAO and IATA, between 2004 and 2012 world airlines produced cumulative operating profits of \$95.7 billion (with eight years out of nine posting gains) and net profits of \$14.0 billion (with five years out of nine posting gains).⁶

⁶ IATA Financial Forecast, December 2012.

World Air Carrier Profit/Loss

U.S. Travel Demand

By year end of FY 2012, the U.S. commercial aviation industry consisted of 15 scheduled mainline air carriers that used large passenger jets (over 90 seats) and 70 regional carriers that used smaller piston, turboprop, and regional jet aircraft (up to 90 seats) to provide connecting passengers to the larger carriers. Mainline and regional carriers offer domestic and international passenger service between the U.S. and foreign destinations, although regional carrier international service is confined to the border markets in Canada, Mexico, and the Caribbean. Thirty-three all-cargo carriers were providing domestic and/or international air cargo service at the end of 2012.

Shaping today’s commercial air carrier industry are three distinct trends: (1) continuing industry consolidation and restructuring; (2) continued capacity discipline in response to external shocks, and (3) the proliferation of ancillary revenues.

The restructuring of the US airline industry that began in the aftermath of the terror attacks of September 11, 2001 and consolidation continued in 2012. Operations at AirTran Airways were folded into Southwest Airlines, while operations at Continental Airlines were folded into United Airlines. For the regional carriers, the operations at Mesaba, were folded into Pinnacle, and Atlantic Southeast was folded into ExpressJet, respectively. In early FY 2012 American Airlines declared bankruptcy and began the process of reducing flights and aircraft to bolster profitability. During the year, US Airways was actively pursuing a merger with American, furthering hopes of

additional consolidation⁷. Consequently, when compared to 2007, 7.7 percent fewer domestic ASMs were flown and 5.3 percent less passengers were carried domestically in 2012. This has had clear implications on the size of the aircraft being used and the load factors, topics which will be discussed later in this document.

One of the most striking outcomes of industry restructuring has been the unprecedented period of capacity discipline, especially in domestic markets. Between 1978 and 2000, ASMs in domestic markets increased at an average annual rate of 4 percent a year, recording only two years of decline. Even though domestic ASMs shrank by 6.9 percent in FY 2002, following the events of September 11, 2001, growth resumed and by 2007, domestic ASMs were 3.7 percent above the FY 2000 level. However, since 2007, ASMs in the U.S. domestic market have shrunk by 8.1 percent, as the industry responded first to the sharp rise in oil prices (up 155% between 2004 and 2008) and then the global recession that followed (2009 to the present). The 7.7 percent reduction in domestic capacity since 2007 has not been shared equally between the mainline carriers and their regional counterparts. To better match demand to capacity, the mainline carriers contracted out “thin” routes to their regional counterparts because they could provide lift at a lower cost, or simply removed the capacity altogether. In 2012, the mainline carrier group provided 9.2 percent less capacity than it did in 2007 (and carried 7.3 percent fewer passengers). Capacity flown by the regional group has increased 2.4 percent over the same five year period (with passengers carried up 1.8 percent).

The most recent trend to take hold is that of ancillary revenues. Carriers generate ancillary revenues by selling products and services beyond that of an airplane ticket to customers. This includes the un-bundling of services previously included in the ticket price. As noted earlier, U.S. passenger carriers posted net profits for the third consecutive year in 2012 with ancillary revenues a contributing factor to the favorable outcome.

Commercial Air Carriers – Passenger

Coming off of a 2011 highlighted by continued global economic uncertainty with debt restructuring issues plaguing the financial recovery, U.S. commercial air carriers’ traffic and capacity results in 2012 showed little or no growth. System (the sum of domestic plus international) capacity increased 0.1 percent to 995.2 billion ASMs while RPMs increased 0.9 percent to 822.3 billion. During the same period system-wide passengers increased 0.8 percent to 736.7 million; U.S. mainline carrier passenger growth was 1.3 percent while regional carrier passengers declined by 1.2 percent to 162.1 million. In the domestic market, mainline passengers saw an increase for the second consecutive year, up 1.3 percent. Mainline passengers in international markets posted a third year of growth, although at a slower rate than in 2011 (up 1.5 percent).

Even though the recession was officially over in June 2009,⁸ carriers continued to face economic uncertainty in 2012 as corporate travel budgets remained strained and high unemployment persisted accompanied by uncertainty surrounding the “fiscal cliff” and the

⁷ On February 14, 2013, US Airways and American announced a merger between the two carriers.

⁸ According to the National Bureau of Economic Research.

payroll tax break. In such an uncertain environment, the industry held capacity flat (up 0.1 percent), after a 3.4 percent increase in 2011. Given the slight increase in seats available to the travelling public, carriers were still able to raise airfares despite the slow growth in demand. Combining this pricing power with ancillary revenues, U.S. carriers finished 2012 with a net profit.

System load factor and trip length climbed in 2012, even as seats per aircraft mile increased. The average load factor reached a record-breaking 82.6 points, up 0.7 points from 2011. Passenger trip length increased by 2.0 miles to 1,116.2 miles. This marks the tenth consecutive annual increase in trip length. Seats per aircraft mile increased to 141.9 seats (up 0.8 seats per aircraft mile).

U.S. Commercial Air Carriers System RPMs and Enplanements

U.S. Commercial Air Carriers System ASMs and Aircraft Operations

Domestic Passenger Markets

Domestic capacity⁹ increased just 0.1 percent in 2012 after increasing by 2.0 percent in 2011. Departures were down 2.0 percent for the year after remaining flat in FY 2011. Capacity growth hovered around zero throughout the year. Mainline carrier capacity was up 0.7 percent for the year, while regional carrier capacity fell 3.4 percent. At the end of FY 2012, domestic ASMs were still 7.7 percent below pre-recession levels (2007) with departures down 14.3 percent.

**U.S. Commercial Carriers
Domestic Capacity
Fiscal Year 2012**

Domestic passenger enplanements grew at a faster rate than ASMs in 2012 up 0.6 percent. In the first half of the year, domestic passengers were up 1.2 percent but reversed course in the second half of the year as passengers fell 0.1 percent. On a year-over-year basis, mainline carrier enplanements were up 1.3 percent for the year while regional carrier enplanements fell 1.7 percent, posting the second decline in four years for this segment of the industry.

⁹ The 50 states, Puerto Rico, and the U.S. Virgin Islands.

U.S. Commercial Carriers Domestic Traffic Fiscal Year 2012

Similar to passenger counts, domestic RPMs grew faster than ASMs with domestic RPMs up 1.0 percent in FY 2012. Growth slowed during the year with the first quarter up 0.5 percent, the second quarter up 2.6 percent, and the last half of the year up 0.5 percent. For the year, mainline carrier RPM growth was 1.4 percent, while regional carrier RPMs declined 1.7 percent.

Domestic carrier load factor increased 0.7 points to 83.2 percent, with both the mainline and regional carriers groups posting record high loads. Mainline carrier load factor increased 0.5 points from FY 2011 to 84.1 percent, while regional carrier load factor increased 1.4 points to 77.6 percent.

Since FY 2007, total domestic capacity has decreased by 7.7 percent. Mainline carriers have reduced their domestic capacity by 9.2 percent with cutbacks by network carriers more than offsetting the growth of low-cost carriers. Making up some of the shortfall from network carrier capacity cuts during this time are the regional carriers. This segment of the industry has expanded capacity (up 2.4 percent from 2007). During the same period, mainline carrier RPMs have decreased 5.0 percent, while enplanements have fallen 7.3 percent. In comparison, regional carrier RPMs and enplanements have increased 5.3 percent and 1.8 percent, respectively. As a result, mainline carrier domestic capacity share has fallen from 87.6 percent in 2007 to 85.7 percent in 2012, with the share of domestic RPMs flown by mainline carriers dropping from 88.3 percent to 86.8 percent during the same period. In 2012 the regional carriers' domestic passenger share was 24.3 percent, up from 22.6 percent in 2007.

U.S. Commercial Air Carriers Domestic Enplanements by Carrier Group

International Passenger Markets

U.S. carrier ASMs were up 0.1 percent and departures were up 4.8 percent in 2012. ASMs increased in the Latin, and Pacific markets, up 2.7 and 3.9 percent, respectively; but decreased 4.4 percent in the Atlantic market.

**U.S. Commercial Carriers
International Capacity*
Fiscal Year 2012**

*Scheduled and non-scheduled ops
Source: DOT F-41

Month
■ ASMs ■ Departures

U.S. carrier international RPMs were up a mere 0.6 percent and passenger enplanements were up 2.9 percent in 2012. The Atlantic market posted a decrease, with RPMs decreasing 3.4 percent and enplanements down 2.2 percent. RPMs and enplanements increased 3.9 and 3.1 percent, respectively, in the Latin American market, while RPMs and enplanements increased 4.2 and 3.8 percent, respectively, in the Pacific market.

U.S. Commercial Carriers International Traffic* Fiscal Year 2012

*Scheduled and non-scheduled ops

Source: DOT F-41

■ RPMs ■ Enplanements

The international load factor increased 0.7 percentage points overall in 2012 to 81.5 percent. Load factor increased marginally in all markets: in the Pacific market load factor was up 0.2 points to 82.0 percent; in the North Atlantic market load factor was up 0.8 points to 81.6 percent; and in the Latin America market the load factor increased by 0.9 points to 80.9 percent.

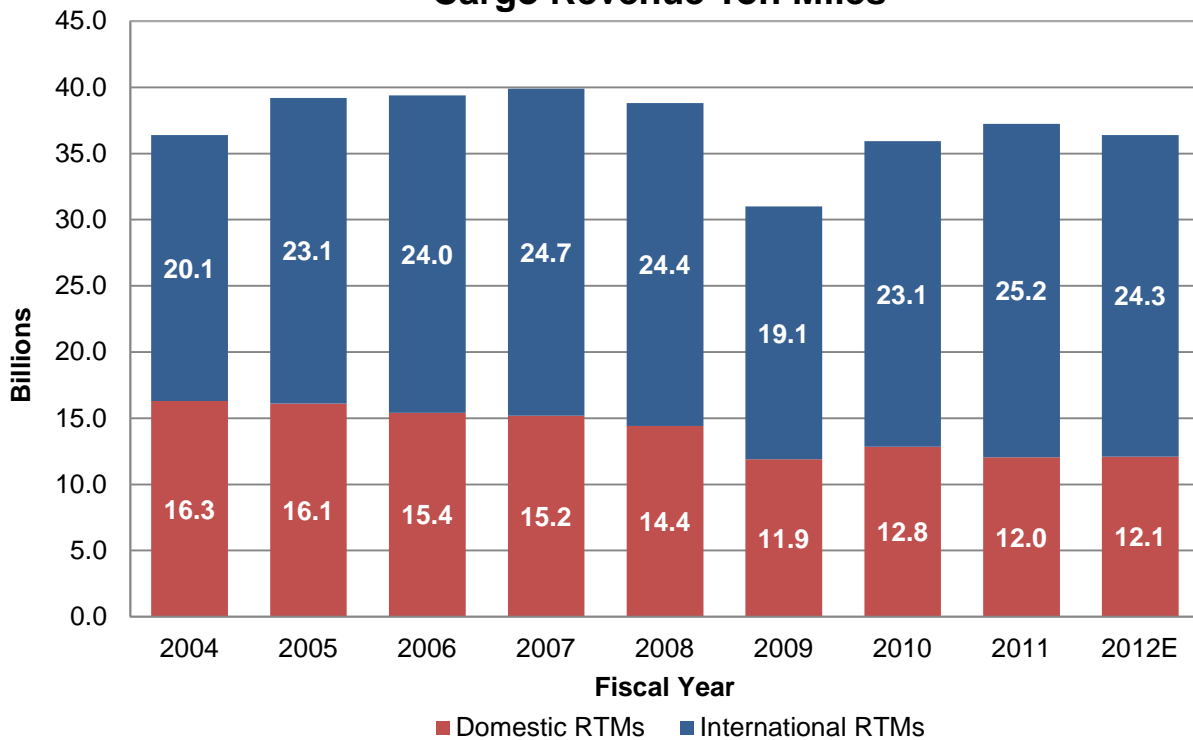

In 2012, 51 percent of the passengers flying abroad on U.S. flag carriers traveled to the Latin America market. The remaining 49 percent of international passengers was split between the Atlantic market (31 percent) and the Pacific market (18 percent).

Commercial Air Carriers – Cargo

Air cargo traffic contains both domestic and international freight/express and mail. The demand for air cargo is a derived demand resulting from economic activity. Cargo moves in the bellies of passenger aircraft and in dedicated all-cargo aircraft on both scheduled and nonscheduled service. Cargo carriers face price competition from alternative shipping modes such as trucks, container ships, and rail cars.

U.S. air carriers flew 36.4 billion revenue ton miles (RTMs) in 2012, down 2.4 percent from 2011. Domestic cargo revenue ton miles (RTMs) remained virtually unchanged (a 0.1 percent increase) at 12.0 billion. However, international RTMs declined by 3.6 percent to 24.3 billion.

**U.S. Commercial Air Carriers
Cargo Revenue Ton Miles**

Air cargo RTMs flown by all-cargo carriers comprised 79.2 percent of total RTMs in 2012, with passenger carriers flying the remainder. Total RTMs flown by the all-cargo carriers decreased 2.6 percent in 2012 from 29.6 billion to 28.8 billion. Total RTMs flown by passenger carriers were 7.6 billion in 2012, 1.6 percent lower than in 2011.

International Air Cargo Revenue Ton Miles by Region

U.S. carrier international air cargo traffic can be divided into four components consisting of Atlantic, Latin, Pacific, and ‘Other International.’ In 2012 total international RTMs decreased 3.6 percent from 25.2 billion to 24.3 billion with all regions except the Latin posting declines. The Latin market saw cargo RTMs increase 3.4 percent from 1.83 billion RTMs to 1.89 billion RTMs. However, cargo RTMs in the Atlantic market fell 3.2 percent, from 7.24 to 7.00 billion while the Pacific region saw a greater contraction, a 5.8 percent decrease from 9.11 billion RTMs to 8.58 billion RTMs. Cargo RTMs in the ‘Other International’ category contracted by 2.9 percent, from 7.06 billion RTMs to 6.85 billion RTMs..

U.S. Commercial Air Carriers 2012 Financial Results

U.S. commercial air carriers posted a net profit of \$ 719 million during FY 2012 after reporting a net profit of \$2.0 billion one year earlier.

Source: DOT Form 41 &

■ Operating Profit/Loss ■ Net Profit/Loss

Operating revenues (passenger and cargo) for FY 2012 were up 3.0 percent from FY2011. The increase in revenue underscored the ability of passenger carriers to push through fare increases and to offer value-added services that leisure and business passengers were willing to buy.

Revenues for cargo carriers remained essentially flat (up 0.5 percent) following a sharp rebound in 2010 and 2011 from the global financial crisis that strengthened demand for air cargo services.

During the same period, operating expenses for all carriers increased 2.9 percent. The increase in operating expenses during FY 2012 was driven by a 24.6 percent rise in the price of fuel for the year, as well as an increase in variable costs resulting from increased demand for passenger and cargo services.

In FY 2012, passenger carriers reported operating income of \$6.0 billion but reported a net loss of \$59 million, while air cargo carriers reported an operating profit of \$2.0 billion and a net income of \$778 million. In the domestic market, passenger carriers generated an operating profit of \$3.0 billion but posted a net loss of \$1.1 billion. In the international market, this carrier group posted operating and net profits of \$3.0 billion and \$1.0 billion, respectively. Cargo carriers posted an operating profit of \$4.1 billion and a net income of \$2.5 billion in domestic markets. In international markets, the cargo carriers reported an operating loss of \$2.1 billion and net loss of \$1.8 billion.

The industry's poorer financial results in FY 2012 are largely due to a turnaround in the performance of the network carriers. After two consecutive years (FY 2010-2011) of net profits totaling \$2.2 billion, this carrier group posted operating profits of \$4.2 billion and a net loss of \$808 million. For the nine reporting low-cost carriers, operating profits totaled \$1.3 billion and net income totaled \$699 million for the full year.

Capacity discipline combined with stable demand resulted in a modest increase in mainline carrier passenger yield for the year. Domestic mainline carrier passenger yield increased 3.5 percent in 2012.

U.S. Commercial Air Carriers Domestic Passenger Yield

Of the reporting regional carriers, operating profits totaled \$0.3 billion and net losses totaled \$27 million for FY 2012, as domestic yield fell 12 percent.¹⁰ Reflecting the changing nature of the industry the network carriers are putting the squeeze on their regional partners by negotiating fee-for-departure contracts that shift more of the financial risk of contract flying to the regional carriers. Since 2007, regional carrier yield is down 39.6 percent in real terms (compared to an increase of 1.8 percent in mainline carrier yield for the same period). The drop in regional carrier yield can be attributed primarily to renegotiated contracts (with lower revenues) between the regional carriers and the network carriers. In addition longer trip lengths (due to a growing number of larger and faster regional jet aircraft entering the fleet) and higher load factors have also contributed to the drop in regional yield. All other things being equal, an increase in either the trip length or the load factor results in drop in yield since fee-for-departure revenues are spread over a broader base of RPMs.

U.S. Commercial Air Carriers 2012 Aircraft Fleets

The commercial passenger carrier fleet is undergoing transformation. The mainline carriers are retiring older, less fuel efficient aircraft (e.g. 737-300/400/500 and MD-80) and replacing them with more technologically advanced A320 and 737-700/800/900 aircraft. The regional

¹⁰ The sharp decline in yield was primarily attributable to a decline in yield at American Eagle resulting from a change in their contractual arrangement with American. Passenger revenues include payments received by regionals from mainline partners for contractual flying.

carriers are growing their fleet of 70 to 90 seat regional jet aircraft and reducing their fleet of 50-seat jet aircraft.

The total number of aircraft in the U.S. commercial fleet (including regional carriers) is estimated at 7,024 for 2012, a decrease of 174 aircraft from 2011. This includes 3,781 mainline air carrier passenger aircraft (over 90 seats), 840 mainline air carrier cargo aircraft, and 2,403 regional carrier aircraft (jets, turboprops, and pistons).

The mainline carriers' passenger jet fleet increased by 19 aircraft in 2012, following an 11 unit increase in 2011. The increase was driven by an 18 unit increase in the low cost carrier fleet. Despite the increase in the fleet in 2012, the mainline carrier fleet now stands at 15.8 percent below (707 aircraft) the level it was in 2000. The regional carrier fleet was also reduced in 2012, falling by 163 units, and now stands at its lowest level since 2002. Consolidation among

regional carriers and high fuel prices continue to spur retirements of 50 seat and smaller regional jets.

GENERAL AVIATION

General aviation industry began to show signs of recovery in 2012, especially with strong growth in rotorcraft and the agricultural aircraft segment of the turboprop deliveries, as well as a modest growth in the single-engine piston sector. Slow economic recovery and economic uncertainties continued to impact the turbojet and multi-engine piston deliveries.. Based on figures released by the General Aviation Manufacturers Association (GAMA), U.S. manufacturers of general aviation aircraft delivered 1,514 aircraft in CY 2012, 3.3 percent more than CY 2011. This translates into the second year of increase in shipments. Data were revised from all segments, but most significantly from agricultural aircraft producers. This revealed an increase of 9.8 percent in total deliveries in CY 2011, as opposed to a decline as previously estimated. Overall piston deliveries remained in essence flat with an increase of 0.3 percent, with single-engine deliveries up 0.9 percent and the much smaller multi-engine category down 6.0 percent. In the turbine categories, revised data showed turbojet deliveries did not fall in 2011 and were in fact unchanged. However, the latest available data recorded a decline of 4.7 percent in 2012. According to the revised GAMA data, turboprop deliveries were up by 76.3 percent in 2011 and continued to increase by an estimated 16.2 percent in 2012, even though a substantial portion of the deliveries were for the export market. U.S. billings in CY 2012 were totaled \$8.0 billion, down 3.0 percent compared with 2011.

Source: GAMA

■ Shipments —■ Billings (\$ Billion)

General Aviation operations at combined FAA and contract towers increased 0.6 percent in 2012, led by a 1.5 percent increase in local operations despite a fall in itinerant operations. General aviation activity at consolidated traffic facilities (FAA TRACONS) fell 0.6 percent, while the number of general aviation aircraft handled at FAA en-route centers declined by 1.3 percent.

The FAA uses estimates of fleet size, hours flown and utilization from the General Aviation and Part 135 Activity Survey (GA Survey), which has been conducted annually since 1977, as baseline figures upon which assumed growth rates are applied. The results of 2011 survey were not available to use as the basis for our forecast this year. Therefore, estimates of 2011 fleet and hours were based on estimated number of general aviation aircraft in the FAA civil aircraft registration database by the end of CY 2011, and past rates of active aircraft and utilization by type of aircraft and age of the fleet.

Based on the latest FAA assumptions about fleet attrition and aircraft utilization along with General Aircraft Manufacturer's Association (GAMA) aircraft shipment statistics, the active general aviation fleet is estimated to have decreased 1.2 percent in 2011, and remained unchanged in 2012 at 220,670. With the decrease in the active fleet, general aviation flight hours are estimated to have decreased 0.9 percent in 2011 and were flat in 2012 with a scant increase of 0.1 percent at 24.6 million.

Student pilots are important to general aviation and the aviation industry as a whole. Student pilot numbers had been in decline for many years but in 2010 the FAA issued a rule that increased the duration of validity for student pilot certificates for pilots under the age of 40 from 36 months to 60 months. As a result, according to statistics compiled by the FAA's Mike Monroney Aeronautical Center, the number of student pilots at the end of 2010 increased by 64.8 percent, or approximately 47,000 pilots, compared to calendar year end 2009. While the impact of the new rule on the long term trend in student pilots has yet to be fully determined, by the end of 2012, the number of student pilots increased by 1.1 percent from its 2011 level to 119,946. The average age of a U.S. pilot in 2012 was 44.7 years old.

FAA WORKLOAD

In 2012, FAA facilities experienced their fifth year of decline in activity. Commercial air traffic activity fell for the fourth time in five years as declines in air taxi activity offset a slight increase in air carrier activity. The declines in activity were a continuation of the trend started in the second half of FY 2011. Noncommercial activity increased for the first time since 2008 as increases in general aviation activity offset a slight fall in military activity.

Total activity at combined FAA and contract tower airports (the set of 514 towers where FAA provides service, ranging from Atlanta (the busiest with 931,000 operations) to towers with as few as 7,800 operations (Branson, MO) was 50.6 million operations in 2012, down 0.3 percent from 2011 and 26.4 percent below the peak activity level recorded in 2000. Commercial activity (the sum of air carrier and commuter/air taxi) at combined FAA and contract towers fell by 1.3 percent in 2012. Air carrier operations were up 0.1 percent while commuter/air taxi operations declined 3.1 percent. Commercial operations in 2012 were 16.2 percent lower than their peak in 2005.

Non-commercial activity (the sum of general aviation and military) at combined FAA and contract towers increased by 0.4 percent in 2012, the first increase in five years. General aviation activity (26.1 million) was up 0.6 percent while military activity (2.6 million) was down 2.0 percent. The increase in general aviation activity in FY 2012 marked only the third increase in this category since 1999. At the end of 2012, non-commercial aircraft activity was 32.9 percent below the activity in 2000.

In FY 2012, total operations at the large hubs decreased by 0.8 percent to 12.5 million, and constituted 24.6 percent of all towered operations. Activity at the medium hubs fell by 3.7 percent to 5.4 million while activity at the small and non-hub towers increased by 0.4 percent, from 32.6 million to 32.7 million. The share of total towered operations at the medium, and small and non-hub towers in FY 2012 were 10.7 and 64.7 percent, respectively. Since 2000, operations at large hubs have declined by 11.5 percent, while operations at medium hubs have fallen by 40 percent, and operations at small and non-hub towers have declined by 28.2 percent.

Aircraft Activity at Combined FAA and Contract Towers

The FAA pays close attention to the trends occurring at the “Core 30” airports. These airports represent the top 30 airports in the country in terms of passenger activity (except Memphis which is a major freight hub) and account for about 70 percent of commercial passengers. Commercial activity at the Core 30 airports peaked in 2005, but subsequent industry restructuring has resulted in a drop in combined commercial activity at these airports since then. In 2012, commercial activity at the Core 30 airports fell by 1.1 percent from the previous year and was 11.2 percent below 2005 activity levels. Of the Core 30 airports, 12 recorded increases in activity from 2011 with the largest increases occurring at San Francisco (up 6.1 percent) and Newark Liberty (up 3.3 percent). The largest decreases in activity occurred at Memphis (down 12.1 percent), and Salt Lake City (down 9.5 percent). Only six of the Core 30 airports exceeded 2005 peak activity levels during fiscal year 2012, unchanged from the number in 2011.

Only Six of Core 30 Airports are above 2005 Activity Levels FY 2012 VS. FY 2005 Commercial Activity

Since 2005 there has been a pronounced shift in demand which is reflected in the relative growth of commercial operations across the Core 30 airports. Commercial operations at San Francisco (up 23.7 percent), New York-Kennedy (up 14.5 percent), and Denver (up 10.6 percent) have increased the most relative to their 2005 activity levels. Commercial operations at Dulles (down 41.1 percent), and Salt Lake City (down 27.1 percent) show the largest declines from 2005 levels. These activity level shifts reflect the impact of airline industry restructuring. The demise of Independence Air and United’s continuing restructuring of its network resulted in a dramatic reduction of operations at Dulles, while the bankruptcy of Delta, its subsequent merger with Northwest, and the restructuring of the combined network has led to a dramatic shrinking of operations in Salt Lake City.

Non-commercial activity, 91 percent of which is general aviation, increased 0.4 percent in 2012 with general aviation activity rising 0.6 percent. Breaking down the general aviation activity by hub size, general aviation activity at large and medium hubs fell 6.9 and 1.9 percent, respectively, while general aviation activity at small and non-hubs increased by 0.9 percent. However, general aviation activity at all hub categories has fallen substantially since 2005, down 40.4, 37.5, and 22.1 percent, respectively, at large, medium, and small/non hubs. Rising fuel prices, stagnant household incomes, falling household wealth, and a shrinking pilot population are all viewed as contributing to the long run decline in general aviation activity.

In 2012, total activity at FAA en-route centers (40.8 million) decreased 0.8 percent from the previous year, the first decline since 2009. Commercial activity was up slightly (0.4 percent) with air carrier operations up 0.9 percent while commuter/air taxi operations fell 0.9 percent. Non-commercial activity was down 5.2 percent for the year as general aviation activity posted a modest decline (down 1.3 percent) while military activity decreased 16.5 percent. In 2012, air carrier operations were 5.3 percent below their 2000 activity levels and air taxi/commuter operations were 10.3 percent above activity levels for 2000. Operations for the general aviation

and military user groups were 26.0 and 55.6 percent below their 2000 activity levels, respectively.

Aircraft Handled at FAA En Route Centers

FAA AEROSPACE FORECASTS FISCAL YEARS 2013 – 2033

Developing forecasts of aviation demand and activity levels continues to be challenging as the aviation industry evolves and prior relationships change. In times of amplified volatility, the process is filled with uncertainty, particularly in the short-term. Once again, the U.S. aviation industry has shown that the demand for air travel is resilient as it rebounds from its most recent downward spiral caused by the Great Recession. As 2013 begins, lingering questions remain. Are the U.S. and global economies on firm ground? Have the structural changes undertaken by the industry over the past 5 years revamped the industry from one of boom-to-bust to one of sustainable profits? Will industry consolidation continue?

Given the current instability in the global economy, there is much uncertainty as to the timing and strength of a recovery in aviation demand. Nevertheless, the FAA has developed a set of assumptions and forecasts consistent with the emerging trends and structural changes currently taking place within the aviation industry. The intent of these forecasts is to accurately predict future demand; however, due to the large uncertainty of the operating environment, the variance around the forecasts is wider than it was in prior years.

The commercial aviation forecasts and assumptions are developed from econometric models that explain and incorporate emerging trends for the different segments of the industry. In addition the commercial aviation forecasts are considered unconstrained in that they assume there will be sufficient infrastructure to handle the projected levels of activity. These forecasts do not assume further contractions of the industry through bankruptcy, consolidation, or liquidation. They also do not assume any drastic changes in federal government operations.

The commercial aviation forecast methodology is a blended one. The starting point for developing the commercial aviation forecasts (air carriers and regionals) is the future schedules published by Innovata. To generate the short-term forecast (i.e., one year out) current monthly trends are used in conjunction with published monthly schedules to allow FAA forecasters to develop monthly capacity and demand forecasts for both mainline and regional carriers for fiscal and calendar years 2013-14. The medium to long-term forecasts (2014-2033) are based on the results of econometric models.

This year, FAA has changed its model for the U.S. domestic market from a GDP based model to a model based on real disposable personal income (DPI). FAA believes that aviation demand is a derived demand – that is, aviation demand depends upon the level of business and leisure activity in the economy. The level of business and especially leisure activity in the economy is driven in large part by the amount of disposable income (income after taxes) that is in the economy. As the U.S. economy recovers from the great recession, GDP growth may come from areas that don't necessarily translate directly into income growth (inventory accumulation or a reduction in imports). Furthermore, any changes in future tax policy that impact individual taxes will be more directly reflected in changes to DPI as opposed to GDP, and as such, FAA believes that

disposable income, rather than GDP, is a better metric to use for forecasting future demand. The result of this change is the forecast growth in domestic enplanements is lower by approximately 0.4 percent a year over the forecast horizon.

The general aviation forecasts rely heavily on discussions with industry experts conducted at industry meetings, including four Transportation Research Board (TRB) meetings of Business Aviation and Civil Helicopter Subcommittees in May 2012 and January 2013 along with estimates of the fleet from the FAA civil aircraft registration database. The assumptions have been updated by FAA analysts to reflect more recent data and developing trends, as well as further information from industry experts.

The FAA also presents the forecasts and assumptions to industry staff and aviation associations, who are asked to comment on the reasonableness of the assumptions and forecasts. Their comments and/or suggestions have been incorporated into the forecasts as appropriate.

ECONOMIC FORECASTS

For this year’s Aerospace Forecast, the FAA is using economic forecasts developed by IHS Global Insight, Inc. to project domestic aviation demand. Furthermore, the FAA uses world and individual country economic projections provided by IHS Global Insight, Inc. to forecast the demand for international aviation services. Annual historical data and economic forecasts are presented in Tables 1 through 4. U.S. economic forecasts are presented on a U.S. government fiscal year (October through September) basis, whereas international forecasts are presented on a calendar year basis.

As the recovery is now approaching its fourth year, there continue to be headwinds. IHS Global Insight expects the recovery to continue to be modest by historical standards with the economy plagued by high levels of debt, both public and private, and uncertainty about U.S. government finances. How these issues are resolved will determine the future path of the recovery. On the bright side, the housing market is beginning to show signs of life and prior fears of a double-dip recession are unlikely to be realized.

The boost to the economy from fiscal stimulus and inventory buildup has faded, leaving the economy to depend on underlying strength in private demand. Growth is projected to be slow in the first half of FY 2013 as reductions in government spending, expiration of the payroll tax cut, and a drag from Hurricane Sandy limit growth. On a quarter-by-quarter basis U.S. economic growth is projected to range between 1.0 to 3.1 percent for the next two years.

U.S. Gross Domestic Product Seasonally Adjusted Annual Growth by Quarter

Source: IHS Global

Fiscal Year 2013

Fiscal Year 2014

The modest pace of economic recovery has been most evident in the nation's unemployment rate. Since peaking at 9.9 percent in the fourth quarter of FY 2009, the unemployment rate has come down gradually, dropping to 8.1 percent in the fourth quarter of FY 2012. IHS Global Insight is projecting that with the continued modest pace of recovery, the unemployment rate will drop only modestly in FY 2013, averaging 7.8 percent for the year. The slow fall in the unemployment rate will continue to keep income growth in check. Real disposable income (income after taxes) increased only 0.9 percent in 2012. The recovery in real disposable income is projected to continue with increases of 2.0 percent in 2013 and 3.0 percent in 2014 as unemployment falls and the role of taxes in any long term fiscal solution becomes clearer.

In the medium term, (the four year period between 2014 and 2018), U.S. economic growth is projected to average 2.9 percent per year with rates ranging between 2.6 and 3.4 percent. Income growth remains muted during the same period (up an average of 2.7 percent). For the balance of the forecast period, U.S. real GDP growth slows to around 2.5 percent annually while income growth increases to 2.4 percent annually. The long-term stability of U.S. economic growth depends on sustained growth in the workforce and capital stock along with improved productivity and competitiveness.

After the price of oil increased by 6.9 percent in 2012 and 88 percent in total since 2009, IHS Global Insight projects the price, as measured by the Refiners' Acquisition Cost, to fall to \$91 per barrel in 2013 (down 11.5 percent from 2012). Oil prices are forecast to decline to around \$81 per barrel by 2015 and then gradually increase to \$112 per barrel by 2025. For the remainder of the forecast period, oil prices are projected to grow slower than inflation, reaching \$125 per barrel by 2033.

Refiners' Acquisition Cost

Source: IHS Global Insight

Inflation continues to remain in check as energy prices fall in 2013 and 2014. After increasing 2.4 percent in FY 2012, the inflation rate (as measured by the CPI), is projected to rise 1.4 percent and 1.7 percent in 2013 and 2014, respectively. After 2014, consumer price inflation is projected to grow between 1.7 and 2.0 percent per year for the balance of the forecast.

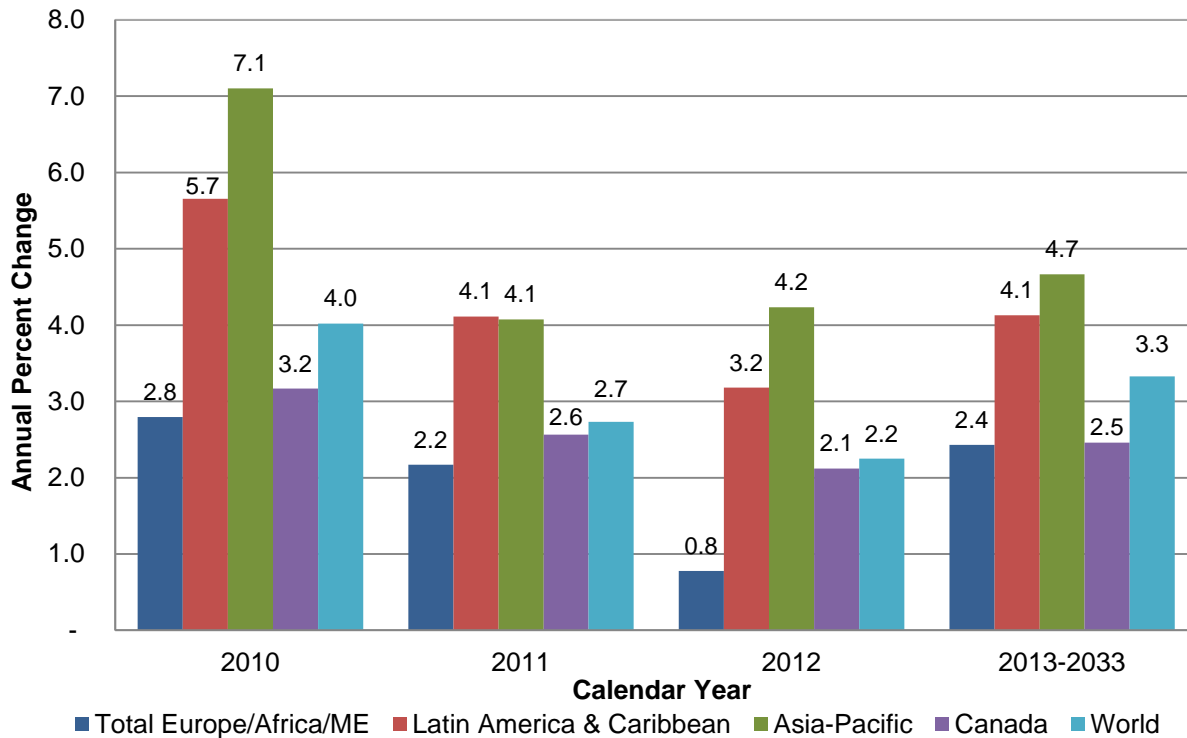

To reflect the uncertainty in the projection of economic growth, the FAA Aerospace Forecast uses high and low economic growth cases along with the base forecast. However due to the increased level of uncertainty surrounding the resolution of U.S. government finances (taxes and spending along with the debt ceiling), the optimistic and pessimistic economic growth cases are based on optimistic and pessimistic scenarios from IHS Global Insight's January 2013 U.S. economic forecast and go out only to 2022. The optimistic case sees a credible plan for long-term deficit reduction being enacted, faster foreign economic growth, along with faster employment growth and sustained improvements in the housing sector. Real GDP growth between 2012 and 2022 in the optimistic case averages 3.1 percent annually compared to 2.6 percent in the base case. The pessimistic case assumes partisan politics turn the task

of raising the debt ceiling into a political crisis and assumes that in the face of uncertainty, cutting spending is the best solution. In addition, the Eurozone crisis intensifies reducing demand for U.S. exports. The private sector retrenches and the housing market slows down, and the U.S. economy enters a mild recession in 2013. Real GDP growth in the pessimistic case averages 1.9 percent annually between 2012 and 2022, 0.7 percentage points lower than the base case. Further details about the high and low scenarios can be found in Appendix A.

World Economy

After weathering the first contraction in global GDP since the Great Depression, a deepening recession in Europe and political stalemates in the U.S. over what to do with the U.S. federal budget, worldwide economic activity is estimated by IHS Global Insight to have expanded by 2.2 percent in 2012, down from 2.7 in 2011. The advanced economies (U.S., Canada, Western Europe, Australia, New Zealand, and Japan) posted growth in output ranging from a low of -0.2 percent to a high of 3.4 percent. The emerging market economies grew 4.8 percent, 1.4 points lower than in 2011 with the economy of China up 7.6 percent, India up 5.1 percent, Brazil up 1.5 percent, and Russia up 3.6 percent. In 2013, economic growth is projected to be 2.2 percent as weak household finances, sluggish employment growth, and constrained banking sectors of the advanced economies prevent global aggregate demand from growing fast enough to offset weakness from inventory accumulation, the recession in Europe, and the lack of stimulus spending. Beyond 2013 for the balance of the forecast period world real GDP is projected to increase an average of 3.2 percent per year.

Real Gross Domestic Product by World Region

Source: IHS Global Insight, GDP Components Tables (Interim Forecast, Monthly), Release date 23 November 2012

The Asia/Pacific and Latin America/Caribbean regions will continue to have the world's highest economic growth rates. These regions are expected to see their economic activity grow at annual rates of 4.5 and 3.9 percent a year, respectively, over the forecast period (2013-2033). China, with a population of approximately 1.35 billion in mid-2012, is forecast to increase population by only 0.3% percent a year from 2012-2025 but is still projected to become the

world's second largest economy by 2013 (surpassing Japan). India, with a population of approximately 1.26 billion, is projected to see its GDP more than quadruple in size, growing at an average rate of 6.9 percent a year during the forecast period. In contrast, Japan grows at just 1.41 percent a year over the forecast horizon as structural impediments, the effects of the 2011 earthquakes and tsunami, and an aging population continues to limit growth.^{11, 12}

AVIATION TRAFFIC AND ACTIVITY FORECASTS

Total traffic and activity forecasts for commercial air carriers (the sum of mainline and regional carriers) are presented in Tables 5 through 9. These tables contain year-to-year historical data and forecasts.

Mainline air carrier traffic and activity forecasts and the forecast assumptions are displayed in Tables 10 through 18, 21, and 23. These tables contain year-to-year historical data and forecasts.

Regional carrier forecasts and assumptions are found in Tables 24 through 27. These tables provide year-to-year historical and forecast data.

Tables 19 and 20 provide year-to-year historical and forecast data for cargo activity. Table 22 provides year-to-year historical and forecast data for the cargo jet fleet.

General aviation forecasts are found in Tables 28 through 31. These tables provide year-to-year historical data and forecasts.

Tables 32 through 34 provide forecasts of aircraft activity at FAA and contract facilities.

Commercial Aviation Forecasts

System capacity is projected to decline slightly in 2013. In the domestic market, mainline carrier capacity expanded slightly (0.7 percent) in 2012 but now is projected to be unchanged in 2013 while capacity for the regional carriers is projected to decline in FY 2013 (down 0.4 percent). In the international sector, capacity is forecast to decrease in the Atlantic market and increase modestly in the Latin and Pacific markets -- resulting in overall international capacity decline of 0.5 percent.

Passenger demand shows minimal growth in 2013 with system RPMs forecast to grow 0.4 percent with all of the increase coming in domestic markets. An upturn in growth is projected for the 2014-18 period coincident with faster economic growth as system RPMs and passengers increase at an average annual rate of 3.2 and 2.6 percent, respectively. Over the same time period, system capacity growth averages of 3.1 percent per year. For the overall forecast period, system capacity is projected to increase an average of 2.8 percent a year. Supported by a growing U.S. and world economy, system RPMs are projected to increase 2.9 percent a year, with regional carriers (up 3.2 percent a year) growing faster than mainline carriers (up 2.9 percent a year). System passengers are projected to increase an average of 2.2 percent a year, with mainline carriers growing at a slightly higher rate (up 2.3 percent a year) than their regional counterparts (up 2.2 percent). By 2033, U.S. commercial air carriers are projected to fly 1.74 trillion ASMs and transport 1.15 billion enplaned passengers a total of 1.46 trillion passenger miles.

Planes will remain crowded, with load factors projected to grow moderately during the early years of the forecast period then tapering during the mid to latter years to 83.9 percent in 2033 (up 0.8 points compared to the beginning of the forecast period in 2013). Passenger trip length is forecast to increase by more than 153 miles over the forecast period to 1,275 miles in 2033 (up 8 miles annually). The growth in passenger trip length reflects the faster growth in the relatively longer international and domestic trips as compared to shorter-haul flights.

U.S. Commercial Air Carriers System Enplanements

Domestic Markets

After expanding slightly in FY 2012 (up 0.1 percent), domestic capacity is projected to remain unchanged in 2013. Mainline carrier capacity is forecast to be flat while that of regional carriers is expected to fall by 0.4 percent. Domestic commercial carrier capacity growth picks up in 2014-2018 period (up 2.3 percent per year) as U.S. economic growth accelerates, with mainline carriers growing slower than regional carriers, 2.1percent versus 3.4 percent. For the entire forecast period (2013-2033), overall domestic capacity is projected to increase at an average annual rate of 2.1 percent, slower than economic growth. Mainline carriers are projected to grow at an annual rate of 2.0 percent while regional carriers are projected to grow at 3.2 percent a year.

**U.S. Commercial Air Carriers
Domestic ASMs**

The slow pace of the economic recovery in the U.S. will restrain RPM growth during 2013, the first year of the forecast (up 0.7 percent). Traffic growth is projected to be sluggish throughout the year as fiscal uncertainty continues to surround the U.S. economy. Mainline carrier RPMs are projected to increase by 0.8 percent during 2013, while regional carrier RPMs are projected to increase by 0.4 percent. Traffic growth improves over the 2014-18 period with annual RPM growth of 2.5 percent as the economic recovery gains steam. For the balance of the forecast period (2018-2033) modest economic growth and falling real yield drives domestic RPM growth of 2.1 percent a year.. Over the entire forecast period (2013-2033),

domestic RPMs grow an average of 2.2 percent a year with mainline carriers growing more slowly than the regional carriers (2.1 percent a year versus 3.2 percent a year, respectively).

Enplanements are forecast to decline slightly (down 0.1 percent) in 2013 following a 0.7 percent increase in 2012. Similar to RPMs, passenger growth is expected to pick up in the 2014-2018 period (up 2.4 percent a year) as the recovery gains momentum and then average 1.8 percent per year for the period 2018-2033. Over the entire forecast period, domestic enplanements are projected to grow at an average annual rate of 2.0 percent with mainline carriers growing more slowly than regional carriers (1.9 versus 2.2 percent a year, respectively).

Reduced capacity combined with a modest recovery in passenger demand provided pricing power for the carriers during 2012, with nominal yield increasing 3.5 percent (up 1.0 percent in real terms). In spite of slow demand growth, flat capacity will further lift fares higher in 2013, with an increase in nominal yield of 2.5 percent (1.0 percent in real terms). For the entire forecast period, nominal yield is projected to increase at an average rate of 1.2 percent a year, while in real terms it is projected to decline at an average rate of 0.8 percent a year. The decline in real yield over the forecast period assumes technological improvements, competition between carriers, and the increasing convergence of cost structures between network carriers and their low-cost counterparts. The convergence in cost structures between the carrier

groups arises from gains in productivity as network carriers retire fuel inefficient aircraft and hold the line on labor costs while low-cost carriers contend with aging fleets, maturing work forces, and unionization.

Domestic commercial carrier activity (departures) at FAA air traffic facilities is projected to grow more slowly than passenger traffic over the forecast period (1.4 percent per year for departures versus 2.2 percent for RPMs). This reflects increased carrier efficiencies in three operational measures: aircraft size, load factor, and trip length.

Overall domestic aircraft size increased by 0.9 seats to 123.4 in 2012 as increases in the mainline carrier group offset a slight decline in the regional carriers. Mainline carrier aircraft size increased 0.4 seats with the retirement of older, fuel inefficient aircraft (i.e. MD-80's and 737-300/400/500). Regional aircraft size decreased by 0.3 seats despite the retirement of 50-seat jet aircraft as larger 70-90 seat jet aircraft entered the fleet. Domestic seats per aircraft are forecast to increase in 2013 (up 0.6 seats) as mainline carrier capacity remains steady while regional carrier capacity falls slightly. Over the balance of the forecast (2014-2033), domestic seats per aircraft are projected to gradually increase to 127.8 seats by 2033, an average of 0.2 seats per year.

The FAA's projection of domestic carrier average aircraft size is greatly influenced by carrier fleet plans, publicly known aircraft order books, and the FAA's expectations of the changing domestic competitive landscape. In the near-term (through 2014), the forecast incorporates several assumptions: 1) mainline carriers desire to constrain ASM capacity growth; 2) the retirement of older inefficient aircraft (many of which are narrow-body); 3) the shifting of wide-body and larger narrow-body aircraft to international services, and 4) growing use of 70-90 seat regional jet aircraft.

In the longer-term, network carriers will replace their older narrow-body aircraft (A320's/B757-200/300) in their domestic route networks with next generation, narrow-body aircraft like the A320 Neo and the 737 Max. The use of smaller aircraft, like the 100-seat Embraer 190, to supplement carrier route structures will be limited. The use of the next generation, narrow-body aircraft will allow mainline carriers to better serve their customers by more closely matching supply (the number of seats) with demand (the number of passengers), and improve profitability through lower operating costs.

Mainline carrier domestic aircraft size increased in 2012 by 0.4 seats to 152.7 seats, and is projected to increase by 0.3 seats in 2013. Domestic aircraft size for mainline carriers is projected to increase by 0.3 seats in 2014 and then gradually increase for the balance of the forecast. Overall, average aircraft size for the mainline group will increase by 5.7 seats between 2012 and 2033, going from 152.7 to 158.4.

Regional carrier aircraft size flown domestically is projected to grow at a much faster pace than that of the mainline carriers. The faster growth in aircraft size for regional carriers is stimulated by continued deliveries of 70 to 90 seat regional jet aircraft that are entering the fleet as well as reductions in the 50-seat and under jet fleet. Regional carriers are better equipped to support operations of their mainline partners by providing capacity that complements market demand. The larger share of 70 to 90-seat regional jets in the fleet coupled with significant 50-seat jet and small turboprop retirements over the next few years increases the average seating

capacity of the regional fleet from 56.1 seats in 2012 to 56.9 seats by 2014. Over the course of the forecast, the seats per aircraft ratio for the regional carriers increases an average of 0.4 seats per year to 65.4 seats in 2033. The changing aircraft fleet mix is narrowing the gap between the size and aircraft types operated by the mainline and regional carriers.

The commercial carrier domestic load factor increased 0.7 points during FY 2012 to an all-time high of 83.2 percent, with record load factors posted by the mainline and regional carrier groups. The mainline carrier group posted a load factor of 84.1 percent, up 0.5 percentage points from 2011. The load factor for the regional carriers increased by 1.4 points to 77.6 percent. In 2013, the domestic load factor is forecast to increase 0.6 points to 83.2 percent as both mainline and regional carriers increase by 0.6 percentage points. Thereafter, the commercial carrier domestic load factor gradually rises to 85.2 percent by 2033.

In 2012 the average domestic passenger trip length increased by 3.5 miles to 883.6 miles in total, after increasing by 5.1 miles in 2011. Passenger trip length is forecast to increase by 7.2 miles in 2013 as carriers continue to restructure their networks and realign capacity. After 2013, trip length is projected to remain stable for a number of years before steadily increasing from 2018 onwards, reaching 939.8 miles by 2033. The increase in trip length reflects longer trips flown by the mainline and regional carrier group. Mainline carrier trip length increases as thinner, relatively shorter haul markets are relinquished to regional partners and replaced with longer domestic trips. Regional carrier trip length increases as flying in shorter haul markets is abandoned and/or reduced as more of the larger 70 and 90-seat regional jets continue to penetrate thinner longer-haul markets previously served with mainline equipment.

Another key factor in predicting aviation activity relative to passenger demand is the level of connecting versus non-stop (origin-destination) traffic. However, as the current cycle of U.S. airline industry restructuring unfolds and hub structures change, the impact on local communities and airport activity levels can vary significantly.

The FAA analyzes the ratio of passenger enplanements to origin-destination (O&D) passengers over time to identify changes in connecting versus non-stop traffic. This ratio is an indicator of the tendency of the average passenger to connect during a typical journey. The closer the ratio is to 1.0, the more passengers fly on a point-to-point routing. As the chart below shows, the overall ratio for the U.S. domestic industry varied within a narrow band between 1995 and 2002. After 2002, the ratio trailed downward to its lowest level (1.32 enplanements for every O&D passenger) by 2007. The decline in the ratio during this six year period is characterized by a drop in connectivity by the network carriers and a rising passenger share for the low-cost carriers. A slight uptick in the ratio started again in 2009 (1.34 enplanements for every O&D passenger) and continued into 2012 (1.35 enplanements for every O&D passenger); this highlights the retrenchment by carriers as fuel costs skyrocketed and demand for air travel plummeted. The FAA's forecast recognizes the changing pattern of domestic traffic connectivity and these trends are captured in the forecast's passenger enplanement totals.

U.S. Commercial Carriers Domestic Enplanements per Origin-Destination Passenger

International Markets

U.S. and Foreign Flag Carriers

The FAA provides forecasts of total international passenger demand¹³ for travel between the United States and three world travel areas: Atlantic, Latin America (including Mexico and the Caribbean), and Asia/Pacific, as well as for U.S.–Canadian transborder traffic. These forecasts are based on historical passenger statistics provided by the U.S. Customs and Border Protection¹⁴ and Transport Canada, and on regional world historical data and economic projections from Global Insight, Inc.

Total passenger traffic between the United States and the rest of the world is estimated to total 171.8 million in CY 2012, 3.7 percent higher than in 2011. Passenger demand remains consistent in 2013 (up 2.6 percent) and accelerates in 2014 (up 4.5 percent) as the world economic recovery solidifies. For the balance of the forecast period, stable worldwide economic growth leads international passengers to grow at an average rate of 4.1 percent a year, totaling 402.9 million in 2033.

¹³ The sum of U.S. and foreign flag carriers.

¹⁴ Customs and border protection data is processed and released by the Department of Commerce.

In the Latin America region, sustained economic growth drives passenger growth to an average of 4.7 percent a year over the entire forecast period (2013-2033). The highest growth is projected for Brazil (average annual growth of 6.1 percent) while the largest market in the region, Mexico, grows at an average of 4.6 percent a year. The slowest rates of growth are projected to occur in the Bahamian and Jamaican markets (averaging growth of 0.1 and 2.8 percent a year, respectively).

Emerging economies in the Asia-Pacific market boost passenger demand an average of 4.3 percent per year. Taiwan, South Korea, India and China (passenger growth of 4.7, 4.7, 5.2 and 6.7 percent a year, respectively) are forecast to be the fastest growing markets in the region. Growth in the Japan market (the largest and most established in the region) is projected to be well below the regional average at 3.0 percent a year.

In the more mature Atlantic market, the Open Skies agreement between the European Union and the United States along with competition between global airline alliances helps fuel passenger growth of 4.1 percent a year over the forecast period. Over the 20-year forecast horizon, average annual passenger growth in the top four Atlantic country specific markets (the United Kingdom, Netherlands, Ireland and Germany) is 3.9, 4.0, 4.6, and 4.7 percent, respectively.

Growth in the Canadian transborder market is forecast to be higher than that of the domestic U.S. market (2.0 percent), averaging 3.1 percent a year over the forecast period.

U.S. and Foreign Flag Carriers Passengers to/from U.S. Calendar Years 2013-2033

Source: US Customs & Border Protection data processed and released by Department of Commerce; data also received from Transport Canada

U.S. Flag Air Carriers

International U.S. commercial air carrier capacity saw minimal growth overall in 2012, up 0.1 percent from 2011. The Atlantic market fell quite a bit (down 4.4 percent) after having made a recovery in 2011 whereas both the Latin and Pacific markets continued their upward trajectories (both up 3.9 percent) but at diminished rates compared to 2011. In 2013, moderate demand and increasing competition between global alliances is expected to boost capacity in Latin (up 4.8 percent) and the Pacific (up 0.9 percent) markets but lackluster performance in the Atlantic (down 4.9 percent) market will result in overall international capacity falling by 0.5 percent. System-wide capacity is projected to recover in 2014 (up 3.9 percent), fueled by stronger economic growth projected for all world regions, and is projected to average 4.2 percent a year for the remainder of the forecast period. Moderate growth over the forecast period reflects favorable U.S. and world economic activity as it recovers from the global contraction.

U.S. Commercial Air Carriers International ASMs

U.S. commercial air carrier international RPMs and enplanements increased 0.9 and 2.4 percent, respectively, in 2012. The strong growth in enplanements relative to RPMs and ASMs highlights a return to earlier years when carriers actively restrained capacity as demand resumed following the world financial crisis in 2009. An increase in RPMs for the Latin market (up 3.9 percent) and Pacific market (up 4.2 percent) barely helped offset a substantial decrease in the Atlantic market (down 3.4 percent). In 2013, U.S. carrier international RPMs are expected to decrease by 0.2 percent as cuts in the Atlantic market (down 4.9 percent) more than offset increases in the Latin American market (up 5.2 percent), and the Pacific

market (up 1.9 percent). For the balance of the forecast, RPMs increase an average of 4.2 percent a year with the fastest growth showing in the Latin region (up 4.8 percent).

International enplanement growth for 2013 is projected to be 0.7 percent with the Atlantic region falling by 4.6 percent as the bleak economic outlook for Europe impacts demand. Enplanements are projected rebound at 3.8 percent in 2014 with all regions showing gains. Over the balance of the forecast period (2015-2033), enplanements are forecast to increase an average of 4.1 percent a year with the fastest growth in Latin and Pacific markets (up 4.5 and 4.2 percent a year, respectively).

The growth in U.S. carrier international passengers over the period 2012-2033 (4.0 percent a year) compares favorably to the growth in overall international passengers (4.1 percent a year, including the U.S.-Canada transborder market). Forecasts of international demand assume U.S. and foreign flag carriers will benefit from improving economic activity in both the United States and world markets.

International load factor for U.S. commercial carriers was 81.3 percent in 2012, an increase of 0.6 points from 2011. Load factor is expected to increase another 0.3 points in 2013 as capacity falls a bit faster than traffic. International load factor is projected to increase 0.5 points to 82.1 percent in 2014 as traffic growth exceeds capacity growth in all three world markets and remains at that level for the remainder of the forecast out to 2033.

International passenger real yields for U.S. mainline carriers were up 2.1 percent in 2012 as all regions posted increases with the largest increase in the Pacific market (up 3.5 percent), followed by the Latin and the Atlantic markets (both up 1.7 percent). Excess capacity in the Latin market coupled with weak demand in the Atlantic market leads to a 3.4 decline in international real yield in 2013. For the remainder of the forecast period, real yield decreases an average of 0.7 percent a year. In nominal terms, international yields are forecast to decrease 2.0 percent in 2013, and increase 1.1 percent in 2014 and then grow at an annual rate of 1.3 percent over the remainder of the forecast. The decline in real yields assumes competitive pressures and technological improvements will hold the line on fare increases.

Commercial Air Carriers – Air Cargo

Historically, air cargo activity tracks with GDP. Additional factors that affect air cargo growth are fuel price volatility, movement of real yields, and globalization. Significant structural changes have occurred in the air cargo industry; among these are air cargo security regulations by the FAA and TSA, maturation of the domestic express market, a shift from air to other modes (especially truck), use of all-cargo carriers (e.g., FedEx) by the U.S. Postal Service to transport mail, and the increased use of mail substitutes (e.g., faxes, e-mail).

The forecasts of Revenue Ton Miles (RTMs) are based on several assumptions specific to the cargo industry. First, security restrictions on air cargo transportation will remain in place. Second, most of the shift from air to ground transportation has occurred. Finally, long-term cargo activity will be tied to economic growth.

The forecasts of RTMs were based on models that link cargo activity to GDP. Forecasts of domestic cargo RTMs were developed with real U.S. GDP as the primary driver. Projections of international cargo RTMs were based on growth in world GDP, adjusted for inflation. The distribution of RTMs between passenger and all-cargo carriers was forecast based on an analysis of historic trends in shares, changes in industry structure, and market assumptions.

Total RTMs shrank by 2.4 percent in 2012 but are forecast to grow slightly (up 0.4 percent) in 2013. Driven by steady U.S. and world economic growth, total RTMs are projected to increase at an average annual rate of 4.6 percent for the balance of the forecast period.

Domestic cargo RTMs increased by 0.1 percent in 2012 and are forecast to decline by 0.9 percent in 2013. Between 2013 and 2033, domestic cargo RTMs are forecast to increase at an average annual rate of 0.8 percent.

The freight/express segment of domestic air cargo is highly correlated with capital spending. Thus, this segment's growth will be tied to growth in the economy. The mail segment of domestic air cargo will be affected by price and substitution (e.g. e-mail).

The all-cargo carriers have increased their share of domestic cargo RTMs flown from 70.0 percent in 2000 to 88.0 percent in 2012. This is because of the shrinkage of the domestic freight/express business for passenger carriers as they have responded to the substantial shocks to the aviation system during this time. Shrinking networks, elimination of unprofitable flying, and consolidation have reduced opportunities for growth in their freight/express business. The all-cargo share is

forecast to grow to 89.9 percent by 2033 based on increases in capacity for all-cargo carriers and ongoing security considerations.

U.S. Commercial Air Carriers RTMs

International cargo RTMs unexpectedly fell 3.6 percent in 2012 as fallout from the European debt crisis and a slowdown in China’s economic growth slowed worldwide trade.. They are projected to grow 1.1 percent in 2013 as global trade growth resumes. For the balance of the forecast period, (2013-33) international cargo RTMs are forecast to increase an average of 5.7 percent a year based on projected growth in world GDP.

The share of international cargo RTMs flown by all-cargo carriers increased from 49.3 percent in 2000 to 74.7 percent in 2012. Continuing the trend experienced over the past decade, the all-cargo share of international RTMs flown is forecast to increase modestly to 81 percent by 2033.

Commercial Aircraft Fleet

The number of commercial aircraft is forecast to grow from 7,024 in 2012 to 8,554 in 2033, an average annual growth rate of 0.9 percent or 73 aircraft annually. The commercial fleet is projected to decrease by 113 aircraft in 2013 after shrinking by 174 aircraft in 2012 as the slow recovery in demand and rising fuel prices prompted carriers to prune their fleets. Since 2007, the U.S. commercial airline fleet has contracted by 713 aircraft. In comparison, the U.S. commercial fleet contracted by 262 aircraft between 2000 and 2003, the last downturn in aviation.

U.S. Commercial Aircraft Fleet Calendar Years 2012-2033

The number of passenger jets in the U.S. mainline carrier fleet increased by 19 aircraft in 2012 but is expected to fall by 37 aircraft in 2013 as network carriers continue to remove older, less fuel efficient narrow body aircraft. After 2013, the mainline air carrier passenger fleet increases an average of 58 aircraft a year over the remaining years of the forecast period, totaling 4,907 aircraft in 2033. The narrow-body fleet (including E-190's at JetBlue and U.S. Airways) is projected to grow by 28 aircraft annually over the period 2012-2033; the wide-body fleet grows by 26 aircraft a year as the Boeing 787 and Airbus A350's enter the fleet.

The regional carrier passenger fleet is forecast to decrease by 63 aircraft in 2013 as increases in larger regional jets are more than offset by reductions in 50 seat and smaller regional jets and turboprops. After 2013, the regional carrier fleet is expected to increase by an average of 5 aircraft (0.2 percent) a year over the remaining years of the forecast period, totaling 2,436

aircraft in 2033. The number of regional jets (90 seats or fewer) at regional carriers is projected to grow from 1,645 in 2012 to 2,082 in 2033, an average annual increase of 1.1 percent. All of the growth in regional jets over the forecast period occurs in the larger 70 to 90-seat aircraft. During the forecast period, all regional jets of 50 or less seats are removed from the fleet, reflecting the relaxation of scope clauses. The turboprop/piston fleet is expected to shrink from 758 units in 2012 to 354 in 2033. Turboprop/piston aircraft are expected to account for just 14.5 percent of the regional carrier passenger fleet in 2033, down from a 31.5 percent share in 2012.

Cargo large jet aircraft are forecast to decrease by 28 aircraft over the next two years (from 840 to 812 aircraft in 2014), and then grow to total 1,211 aircraft in 2033. The narrow-body, cargo jet fleet is projected to increase by 3 aircraft a year over the 21-year forecast period as older 757's and 737's are converted to cargo service. The wide-body, cargo jet fleet is projected to increase by 14 aircraft yearly.

General Aviation

The FAA forecasts the fleet and hours flown for single-engine piston aircraft, multi-engine piston, turboprops, turbojets, piston and turbine powered rotorcraft, light sport, experimental and "other" (which consists of gliders and lighter than air vehicles). The FAA forecasts "active aircraft,"¹⁵ not total aircraft. The FAA uses estimates of fleet size, hours flown, and utilization from the General Aviation and Part 135 Activity Survey (GA Survey) as baseline figures upon which assumed growth rates can be applied. The results of the 2011 survey were not available to use as the basis for our forecast this year. Therefore, estimates of 2011 fleet and hours were based on estimated number of general aviation aircraft in the FAA civil aircraft registration database by the end of CY 2011, and past rates of active aircraft and utilization by type of aircraft and age of the fleet. Figures for 2012 are estimated based on other activity indicators. Activity forecasts begin in 2013 and continue through 2033.

After growing rapidly for most of the past decade, and then slowing over the past few years, the most recent shipment activity indicates a cautiously optimistic outlook that the hard impact of the recession on the business jet market is coming to an end. The forecast calls for robust growth in the long term outlook, driven by higher corporate profits and the growth of worldwide GDP, though at rates lower than those predicted last year. Additionally, continued concerns about safety, security, and flight delays keep business aviation attractive relative to commercial air travel. As the industry experts and prior year's survey results report a significant portion of piston aircraft hours are also used for business purposes, we predict business usage of general aviation aircraft will expand at a faster pace than that for personal and recreational use. Increased demand, especially for agricultural use turboprop aircraft also contributes to increased turbine fleet and hours.

The active general aviation fleet is projected to increase at an average annual rate of 0.5 percent over the 21-year forecast period, growing from an estimated 220,670 in 2012 to 246,375 aircraft by 2033. The more expensive and sophisticated turbine-powered fleet

¹⁵ An active aircraft is one that flies at least one hour during the year.

(including rotorcraft) is projected to grow at an average of 2.8 percent a year over the forecast period, with the turbine jet portion increasing at 3.5 percent a year, reaching a total of 24,620 by 2033.

The number of active piston-powered aircraft (including rotorcraft) is projected to decrease from the 2010 total of 159,007 to 146,615 through 2028, with declines in both single and multi-engine fixed wing aircraft, but with the smaller category of piston-powered rotorcraft growing. Beyond 2028, new deliveries are expected to exceed retirements, and so active piston-powered aircraft are forecast to increase to 148,660 by 2033. Over the forecast period, piston-powered aircraft are projected to decrease by an average annual rate of 0.2 percent. Although piston rotorcraft are forecast to increase by 2.2 percent a year, they are a relatively small part of this segment of general aviation aircraft and therefore have little effect on the overall trend. Single-engine fixed-wing piston aircraft, which are much more numerous, are projected to decline at a rate of 0.2 percent, while multi-engine fixed wing piston aircraft are projected to decline by 0.6 percent a year.

Starting in 2005, a new category of aircraft (previously not included in the FAA's aircraft registry counts) was created: "light sport" aircraft. At the end of 2011, a total of 6,645 active aircraft were estimated to be in this category. The forecast assumes about 3.2 percent annual growth of the fleet through 2013. Thereafter the rate of increase in the fleet slows to about 2 percent per year. By 2033, a total of 10,245 light sport aircraft are projected to be in the fleet.

The number of general aviation hours flown is projected to increase by 1.5 percent yearly over the forecast period. The FAA projects above average growth in hours will occur after 2023 with

increases in the fixed wing turbine aircraft fleet, as well as a rebounding single engine piston fleet and increasing utilization of single engine piston aircraft as the aging of this fleet starts to slow down. In the medium term, much of the increase in hours flown reflects strong growth in the rotorcraft and turbine jet fleets. Hours flown by turbine aircraft (including rotorcraft) are forecast to increase 3.3 percent yearly over the forecast period, compared with a slight decline of 0.2 percent for piston-powered aircraft. Jet aircraft are forecast to account for most of the increase, with hours flown increasing at an average annual rate of 4.3 percent over the forecast period. The large increases in jet hours result mainly from the increasing size of the business jet fleet, along with a measured recovery in utilization rates from recession induced record lows. Turboprop hours are also expected to increase significantly from what forecast last year, due to the recent trend of significant increase in agricultural use turboprop aircraft, with an average of 2.1 percent per year. Rotorcraft hours, which were less impacted by the economic downturn when compared to other categories and rebounded earlier, are projected to grow by 2.7 percent yearly. An expected decline in utilization rates of turbine rotorcraft is due to the assumption that recently improved affordability at the lower end of the turbine market will sustain the recent market share shift toward turbines; however, as turbine powered rotorcraft replaces the pistons, and since most of their functions will remain unchanged, utilization rates of some of the new turbines will be closer to those of the pistons. Lastly, the light sport aircraft category is expected to see an increase in hours flown of 3.3 percent a year; this is primarily driven by growth in the fleet.

Hours Flown in General Aviation Aircraft

The number of active general aviation pilots (excluding air transport pilots) is projected to be 508,300 in 2033, an increase of over 40,000 (up 0.4 percent yearly) over the forecast period.

Commercial pilots are projected to increase from 116,400 in 2012 to 131,800 in 2033, an average annual increase of 0.6 percent. The number of student pilots is forecast to decrease at an average annual rate of 0.1 percent over the forecast period, declining from 119,946 in 2012 to 117,400 in 2033. In addition, the FAA is projecting that by the end of the forecast period a total of 14,200 sport pilots will be certified. As of December 31, 2012, the number of sport pilot certificates issued was 4,493 reflecting a steady increase in this new “entry level” pilot certificate that was only created in 2005. The number of private pilots is projected to grow at an average yearly rate of 0.2 percent over the forecast period to a total of 195,600 in 2033 from 188,001 in 2012.

FAA Workload Forecasts

FAA and Contract Towers

Activity at the 514 FAA (264) and contract towers (250) totaled 50.6 million operations in 2012, down 0.3 percent from 2011. Activity is projected to fall another 0.3 percent in 2013, with declines in both commercial and non-commercial activity. Growth in total activity at FAA and contract towers resumes in 2014 (1.0 percent) and for the balance of the forecast, activity grows at an average rate of 1.0 percent per year, reaching 61.1 million operations in 2033.

Most of the growth over the forecast period results from increased commercial aircraft activity (up 1.6 percent annually). Air carrier activity is projected to increase slightly (0.6) percent in 2013 as carriers keep capacity under control given the uncertain economic environment. Beyond 2013, air carrier activity is projected to increase an average of 2.5 percent per year over the forecast period. The increase in air carrier activity is driven by combination of mainline carriers increasing capacity in response to growing demand as well as an increase in the operations of 70-90 seat jets which are counted in the air carrier category. Commuter/air taxi operations are forecast to fall 1.9 percent in 2013 and decrease 0.1 percent a year for the balance of the forecast period as regional jets less than 50 seats exit the industry.

General aviation activity increased 0.6 percent in 2012 as local activity rose 1.5 percent.. Overall general aviation activity is projected to fall slightly in 2013 (down 0.2 percent) reflecting the impact of the uncertainty surrounding the economic outlook before beginning to rise modestly in 2014 (up 0.4 percent) as a growing economy promotes the growth of flight hours and operations. For the entire forecast period, general aviation activity at towered airports is projected to increase an average of 0.4 percent a year, to 28.5 million operations in 2033. General aviation activity at combined FAA/contract towers grows in line with the modest increase forecast for general aviation piston hours already cited. Most operations at the smaller towers are in piston aircraft, while those at the largest airports tend to be turbine operations.

Military activity fell 2.0 percent in 2012 and is assumed to remain at 2012 levels (2.6 million) throughout the balance of the forecast period.

The forecasted growth in operations is not uniform across all facility categories. Over the forecast period, total operations at large hub airports (those airports that enplane 1% or more of total US enplanements) are projected to increase from 12.4 million in 2013 to 17.2 million in 2033, an average annual rate of 1.7 percent a year. Operations at these facilities are overwhelmingly commercial in nature (95.3 percent in 2012) and their growth will mirror the growth in total commercial operations. Total operations at medium hub airports (those airports that enplane 0.25 to 0.99 percent of total US enplanements) are projected to increase a bit slower than the large hubs, averaging 1.5 percent a year over the forecast period, to total 7.2 million in 2033. In the largest category, small and non-hub airports, where 82 percent of the operations are non-commercial in nature, total operations are projected to increase from 32.8 million in 2013 to 36.7 million in 2033, an average annual rate of 0.6 percent a year.

Operations¹⁶ at FAA TRACONS (Terminal Radar Approach Control) fell 1.4 percent in 2012, the eighth year in a row. They are projected to fall an additional 1.2 percent in 2013 as both commercial and non-commercial activity decline. After 2013, TRACON operations are forecast to increase at an average annual rate of 1.2 percent for the balance of the forecast. For the entire forecast period, TRACON operations grow an average of 1.2 percent per year, totaling 47.2 million in 2033.

Over the forecast period, commercial aircraft operations at FAA TRACONS are forecast to increase at 1.6 percent per year driven by growth in air carrier activity. General aviation operations at FAA TRACONS are projected to grow 0.6 percent a year, reflecting the slow growth in the general aviation fleet and hours. Military activity is expected to remain at its 2012 level (2.3 million) of activity throughout the forecast period.

En-route Centers

The number of IFR aircraft handled at FAA en-route traffic control centers decreased 0.8 percent to 40.9 million in 2012, as declines in general aviation and military activity offset a slight increase in commercial aviation activity. In 2013 a modest increase in airline activity offsets a

¹⁶ TRACON operations consist of itinerant Instrument Flight Rules (IFR) and Visual Flight Rules (VFR) arrivals and departures at all airports in the domain of the TRACON as well as IFR and VFR overflights.

fall in general aviation activity, resulting in en-route center activity increasing by 0.4 percent. After 2013, through the balance of the forecast period, en-route activity increases 1.8 percent annually, reaching 58.2 million aircraft handled in 2033. Over the entire forecast period, commercial activity is projected to increase at an average annual rate of 1.9 percent, reflecting increases in the commercial fleet and aircraft stage lengths. During the same period, general aviation activity is projected to grow 0.7 percent per year, reflecting growth in business aviation. Military activity is held constant at the 2012 activity level throughout the forecast period.

Activity at FAA en-route centers is growing faster than at towered airports because more of the activity at en-route centers is from the faster growing commercial sector and high-end (mainly turbine) general aviation flying. Much of general aviation activity at towered airports, which is growing more slowly, is local in nature, and does not impact the centers.

UNMANNED AIRCRAFT SYSTEMS

Unmanned Aircraft Systems (UAS) are currently the most dynamic growth sector within the aviation industry and have two distinctive characteristics. First, they have no human pilot/operator onboard and second, they are remotely operated by a pilot using data link transmissions.

As shown in the graph below, the Teal Group forecasts worldwide annual spending on research, development, testing, and evaluation procurement will increase from \$6.6 billion in 2013, to \$11.4 billion in 2022 for all UAS. Over the next ten years, Teal Group forecasts total UAS spending worldwide at \$89.1 billion.

Teal UAS Budget Forecast
R&D and Procurement

Most UAS were initially developed for military applications but have great potential for cross over to commercial and civil markets. The most popular military UAS use is for reconnaissance and surveillance, so we would expect that these types of operations would be adopted more quickly. As such, we expect that search and rescue will be an extremely viable for UAS.

In 2009, the FAA created the Unmanned Aircraft Program Office (UAPO) to integrate UAS safely and efficiently into the National Airspace Systems and coordinate all FAA certification and operational policy activities related to UAS. In October 2010, the UAPO published a Civil/Public UAS roadmap to clarify the path toward certification and operation of UAS in the NAS. The FAA is continuing to develop a plan to accelerate the integration of civil UAS into the NAS.

With all the possible applications for unmanned aircraft, the FAA forecasts the largest near-term growth in civil/commercial unmanned operations will be in the area of Small Unmanned Aircraft Systems (sUAS). The FAA is continuing to make a significant effort to develop the necessary regulatory framework for Small Unmanned Aircraft Systems to operate. The regulatory framework will include standards, airworthiness criteria, certification and procedures for sense and avoid systems, as well as protocols to be used for the certification of command control and communication systems in the defined flight environment.

We believe that the civil UAS markets will evolve within the constraints of the regulatory and airspace requirements. Once enabled, commercial markets will develop and demand will be created for additional UAS and the accompanying services they can provide. Once enabled, we estimate roughly 7,500 commercial sUAS would be viable at the end of five years.

COMMERCIAL SPACE TRANSPORTATION

The Federal Aviation Administration's (FAA) Office of Commercial Space Transportation (AST) licenses and regulates U.S. commercial space launch activity including launch vehicles and non-federal launch sites authorized by Executive Order 12465 and Title 51 U.S. Code, Subtitle V, Chapter 509 (formerly the Commercial Space Launch Act). Title 51 and the Executive Order also direct the Department of Transportation (carried out by the FAA) to encourage, facilitate, and promote U.S. commercial launches. AST's mission is to license and regulate commercial launch and reentry operations and non-federal launch sites to protect public health and safety, the safety of property, and the national security and foreign policy interests of the United States.

Overview

Commercial space transportation primarily consists of commercial launch service providers launching satellites and cargo into orbit for either commercial or government customers. Commercial space transportation also includes suborbital launches, where a payload or a vehicle is launched on a trajectory that briefly enters space but returns to Earth without entering orbit. Finally, it includes the reentry of objects from space to Earth.

The FAA licenses several expendable vehicles used for commercial orbital launches. The most frequently used vehicles are:

- Atlas V, a heavy-class vehicle built by United Launch Alliance (ULA), a joint venture between Boeing and Lockheed Martin, and marketed by Lockheed Martin Commercial Launch Services (LMCLS);
- Delta IV, a heavy-class vehicle and the Delta II, a medium-class vehicle, both built by ULA and marketed by Boeing Launch Services (BLS);
- Falcon 9, an intermediate-class launch vehicle built, operated, and marketed by Space Exploration Technologies Corp. (SpaceX).
- Pegasus and Taurus, two small vehicles built, operated, and marketed by Orbital Sciences Corporation (Orbital); and
- Zenit-3SL, a heavy-class vehicle built by the Ukrainian company KB Yuzhnoye for the Russian-owned Sea Launch venture, launched from a floating launch platform based at Long Beach, CA.

The medium-class Antares by Orbital is currently under development and its first launch is planned for 2013.

From 1989 through the end of 2012, DOT/FAA has licensed 212 orbital and suborbital commercial launches.

Experimental Permits, for suborbital reusable vehicle development and test flights, were first granted by the FAA in 2006 to Blue Origin and Armadillo Aerospace. Other permits have been

granted for vehicles participating in the Lunar Lander Challenge, completed in 2009. Since then, Experimental Permits have been issued to Blue Origin, SpaceX, and Scaled Composites as those companies develop new vehicles.

Eight commercial spaceports, located in six states, Alaska, California (part of Vandenberg Air Force Base and Mojave Air and Space Port), Florida (Cape Canaveral and Cecil Field Spaceport), New Mexico, Oklahoma, and Virginia, currently have FAA launch site operator licenses. Several other commercial spaceports around the United States are under development.

Review of 2012

There were five FAA-licensed orbital launches in 2012, up from one in 2011. SpaceX's Falcon 9 vehicle made two licensed launches to the International Space Station. In May, SpaceX completed its second flight under NASA's Commercial Orbital Transportation Services (COTS) program, and in October, the company launched its first flight under NASA's Commercial Resupply Services (CRS) program. Sea Launch's Zenit-3SL vehicle performed three licensed launches, which carried Intelsat 19, Intelsat 21, and Eutelsat 70B communications satellites to geostationary orbit.

	2011	2012	2013 Forecast
Licensed Launches	1	5	7-12
Permitted Launches	2	2	10-25

FAA Licensed and Permitted Launches, 2011-2012

Worldwide there were 20 orbital commercial launches in 2012, compared to 18 in 2011. In addition to the five FAA-licensed launches, Europe performed six commercial launches, all on the Ariane 5 vehicle. Russian conducted seven commercial launches, all on the Proton M vehicle, and China conducted two commercial launches on the Long March 3B and Long March 2D vehicles. There were 78 total worldwide commercial, civil, and military launches in 2012, with commercial launches representing approximately 26 percent of the total. For more details, see the 2012 *Year in Review* report available online at:

http://www.faa.gov/about/office_org/headquarters_offices/ast/reports_studies/year_review/.

Global Forecast

In May 2012, the FAA and the Commercial Space Transportation Advisory Committee (COMSTAC) published their annual global forecast for commercial launch demand, the *2012 Commercial Space Transportation Forecasts*. The report forecasts an average of 29.1 commercial orbital launches per year of geosynchronous orbit (GSO) and non-geosynchronous orbit (NGSO) payloads through 2021. That annual average includes 16.3 launches of medium-to-heavy vehicles to deploy GSO satellites, 12.0 launches of medium-to-heavy vehicles to NGSO, and 0.8 launches to NGSO by small vehicles.

Combined 2012 GSO and NGSO Historical Launches and Launch Forecasts

Commercial GSO launches are used for communications satellites with masses ranging from 2,000 to over 6,000 kilograms. There has been an increase in the number of GSO satellites that are larger and more complex; however, there is still a demand for smaller satellites. Demand for commercial NGSO launches spans a number of markets, including commercial remote sensing; science and technology demonstration; and replenishment and replacement of low Earth orbit communications satellite systems reaching the end of their lifespan. The majority of commercial NGSO launches for science and technology demonstration missions are for nations that do not have indigenous launch capability.

The GSO and NGSO forecasts are not a prediction of what will actually be launched but instead represent the expected demand for launch services, based on a variety of inputs. The complete forecast report is available at:

http://www.faa.gov/about/office_org/headquarters_offices/ast/reports_studies/forecasts/

Suborbital Reusable Vehicles Forecast

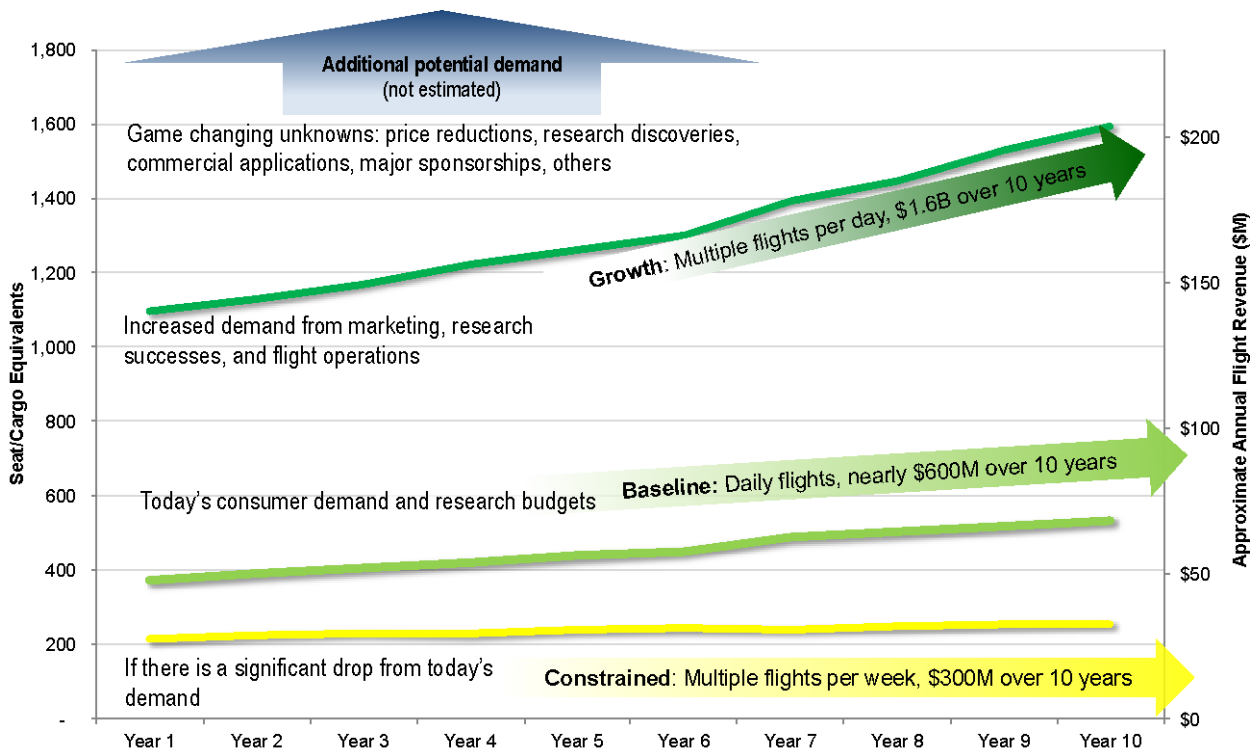

In July 2012, the FAA and Space Florida prepared forecasts of demand for suborbital reusable vehicles (SRVs) for a 10-year period. The goal of the study was to provide information for government and industry decision makers on the emerging SRV market by analyzing dynamics, trends, and areas of uncertainty in eight distinct markets SRVs could address. The eight markets include: Commercial Human Spaceflight, Basic and Applied Research, Aerospace Technology Test and Demonstration, Media and Public Relations, Education, Satellite Deployment, Remote Sensing, and Point-to-Point Transportation. Demand in each market was forecast for three scenarios: baseline, growth, and constrained. The units used are seat/cargo equivalents, translated as either one seat for a single occupant or a cargo equivalent of 3.3 lockers (based on the mid-deck lockers used aboard the Space Shuttle).

Total projected demand for SRVs, across all eight markets, grows from around 370 seat/cargo equivalents in Year 1 to over 500 seat/cargo equivalents in the tenth year of the baseline case. (Year 1 represents the first year of regular SRV operations.) Demand under the growth scenario, which reflects increases due to factors such as marketing, research successes, and flight operations, grows from about 1,100 to more than 1,500 seat/cargo equivalents over ten years. The constrained scenario, which reflects significantly reduced consumer spending and government budgets, shows demand from about 200 to 250 seat/cargo equivalents per year.

	Year 1	Year 2	Year 3	Year 4	Year 5	Year 6	Year 7	Year 8	Year 9	Year 10	Total
Baseline Scenario	373	390	405	421	438	451	489	501	517	533	4,518
Growth Scenario	1,096	1,127	1,169	1,223	1,260	1,299	1,394	1,445	1,529	1,592	13,134
Constrained Scenario	213	226	232	229	239	243	241	247	252	255	2,378

Total projected demand for suborbital reusable vehicles across all markets by seat/cargo equivalents

Demand for SRVs is dominated by Commercial Human Spaceflight. The analysis indicates that about 8,000 high net worth individuals from across the globe are sufficiently interested and have spending patterns likely to result in the purchase of a suborbital flight. The second largest area of demand is Basic and Applied Research, funded primarily by government agencies, and also by research for not-for-profits, universities, and commercial firms. Aerospace Technology Test and Demonstration, Education, Satellite Deployment, and Media and PR generate the remaining demand. The Remote Sensing and Point-to-Point Transportation markets are not forecasted to drive launches at this time.

10-year SRV demand forecast

For more details, see the Suborbital Reusable Vehicles: A 10-Year Forecast of Market Demand report available online at:

http://www.faa.gov/about/office_org/headquarters_offices/ast/reports_studies/forecasts/

RISKS TO THE FORECASTS

The forecasts in this document are forecasts of aviation demand, driven by models built on forecasts of economic activity. There are many assumptions in both the economic forecasts and in the FAA models that could impact the degree to which these forecasts are realized. This year's forecast is driven, at least in the short-term, by a number of factors including the strength of the economic recovery and any impact resulting from the U.S. government fiscal situation. Also, as numerous recent incidents (like the attempted bombing of a Northwest airliner on Christmas Day 2009, the discovery of multiple devices on cargo flights out of Europe in October 2010) remind us, terrorism remains among the greatest risks to aviation growth. Any terrorist incident aimed at aviation would have an immediate and significant impact on the demand for aviation services that would be greater than its impact on overall economic activity.

Although oil prices remained high in 2012, there is still considerable uncertainty as to the level of oil prices once the economic recovery is on firmer ground. The FAA's baseline forecast (derived from economic assumptions in IHS Global Insight's 30-Year Focus released during the fourth quarter of 2012) calls for decreases in oil prices until 2015. These are relatively modest, with the price of oil approaching \$80/barrel by 2015 and then gradually increasing thereafter, approaching \$128/barrel by the end of the forecast period in 2033. Some forecasters are calling for a much sharper increase in the price of oil. The U.S. Energy Information Administration (EIA) in its 2013 Annual Energy Outlook projects oil prices to remain between \$90 and \$100/barrel through 2015-2016 and then rising steadily over the next 17 years, reaching \$200 per barrel in 2033. While lower oil prices give consumers an impetus for additional spending, including air travel, and increases the chances for industry profitability, higher oil prices could lead to further shifts in consumer expenditures away from aviation, dampening a recovery in air transport demand. Furthermore, higher oil prices, especially in the near term, could wipe out industry profitability, put increasing pressure on airline costs, delay balance sheet improvements and discourage expansion plans or orders for new aircraft as carriers focus on maintaining and increasing cash balances.

Although the global economy is growing, the data suggests that growth is concentrated in relatively few countries. As a result, the ensuing economic recovery may not be balanced and there is considerable doubt about the strength and sustainability of the expansion. The baseline forecast assumes that growth in the BRIC¹⁷ economies will be significantly higher than in the other large economies – U.S., Japan and the European Union. Doubts remain over the strength of demand in the U.S., Japan and in the European Union as these areas continue to be constrained by structural economic problems and institutional constraints. In addition, many countries in the European Union have implemented austerity policies, aimed at reducing government spending and personal debt, which could prolong the regional downturn. Furthermore the steps that were taken to resuscitate the global economy may prove to be

¹⁷ Acronym given to the economies of Brazil, Russia, India, and China.

excessive, since the resulting surge in liquidity growth seems to be inflating asset bubbles and exacerbating existing global imbalances. Once the global economy recovers from the current downturn, there could be an increased risk posed by asset bubbles and macroeconomic imbalances, which could result in a deeper, more prolonged, and less manageable recession and financial crisis. The current forecasts assume strong passenger growth for travel between the United States and other world regions. Any slowing of worldwide economic activity could seriously inhibit the growth in global passenger demand.

The outlook for further consolidation via mergers and acquisitions (M&A) appears to be rather limited beyond the announced merger between American Airlines and U.S. Airways. If the merger is approved, this will leave the U.S. industry with four major players (Delta, United, American, and Southwest), who accounted for almost 80% of all capacity and traffic flown in 2012. Of the network carriers, only Alaska remains independent, although it does have code share agreements with both American and Delta. In the low cost carrier sector, the merger between Southwest and AirTran is progressing at a steady pace as the carriers plan to fully connect their networks by April, 2013 and have full integration of the fleet and a single ticketing system by the end of 2014. Aside from Southwest and AirTran, there appears to be little scope for further consolidation as there are significant obstacles. In particular the financial situation of many low cost carriers limits the possibilities of additional merger activity. For many low cost carriers, the sheer size of merger transactions or the amount of financial risk associated with a merger makes further merger activity unlikely. However, U.S. airlines are exploring other options including global alliances. Many of the major carriers in the U.S. are members of global alliances that operate with some measure of anti-trust immunity from the U.S. DOT. While anti-trust immunity may provide flexibility for airline operators across borders, it may create an anti-competitive environment in the marketplace. These market consolidating vehicles, particularly the anti-trust immunity provisions, may invite increased regulatory scrutiny. If such oversights are launched in the future, this will complicate the evolving structure of the airline industry and may impact demand via new regulations.

The forecast assumes the addition of sizable numbers of large regional jets (70 to 90 seats) into the fleet of regional carriers. However, the regional carriers' future is closely linked to those of the larger network carriers. As demand continues to slowly recover, increased financial pressures on regional operators have appeared. Furthermore, as consolidation has occurred among the network carriers, certain regional carriers have found themselves either saddled with excess capacity or lack of sufficient capacity, or lack of feed traffic. Unlike the period after the terror attacks of September 11, 2001, when network carriers also reduced the size and breadth of their networks, regional carriers have not necessarily seen opportunities for increased flying to backfill the loss of the mainline service. While Delta's announced plans to reduce its reliance on small (read 50 seat) regional jets may provide some opportunities for well positioned regional carriers, the overall impact of consolidation so far has been to reduce opportunities for regional flying substantially.

After suffering through a significant downturn in 2009, business and corporate aviation have seen a partial recovery during the past three years. The pace of the recovery in business and corporate aviation is largely based upon the future prospects of economic growth and corporate profits. Future uncertainty in these leading indicators could pose a risk to the forecast, but the risk is not limited to these factors. Public perception of business and corporate

aviation, potential environmental regulations and taxes, along with increased security measures placed on business jets, will place downward pressure on the forecast.

Other factors, such as new and more efficient product offerings and increased competition from new entrant manufacturers, serve to broaden the potential of the industry. Estimates show that a record number of new business jets are delivered overseas and, with the potential easing of regulations on the use of airspace in foreign countries, the scenario for business jet manufacturers looks all the more promising. Raising the level of security restrictions, and the subsequent travel hassles placed on airline passengers, could make corporate jet travel look increasingly appealing.

Not only is the volume of aircraft operating at most large hubs expected to increase over the next 20 years, so is the mix of aircraft for this same period. The expected increases in the numbers of regional jets and business jets will increase the impact the national airspace system and make the FAA's job more challenging. This increase in the mix of aircraft will impact workload strictly due to the increasing demand for aviation services projected over the forecast period.

Although overall activity at FAA and contract towers fell in 2012, activity at many of the largest airports increased in 2012 and delays remained at historically high levels at many U.S. airports. As demand recovers and workload increases, congestion and delays could become a critical limit to growth over the forecast period. FAA's forecasts of both demand and workload are unconstrained in that they assume that there will be sufficient infrastructure to handle the projected levels of activity. Should the infrastructure be inadequate and result in even more congestion and delays, it is likely that the forecasts of both demand and workload would not be achieved.

There are concerns that aviation's impact on the environment could potentially restrict the ability of the aviation sector to grow to meet national economic and mobility needs. Airport expansion or new construction is often a contentious issue because of noise, air quality, and water quality concerns. There is also an ongoing effort to address the climate impacts of aviation. Aviation currently accounts for 2 to 3 percent of global carbon emissions, but this percentage is expected to increase with the growth in operations unless mitigated with new technology, renewable fuels, operational improvements and market based measures. While certain measures to address climate impacts can result in reduced costs, such as increased fuel efficiency, other measures, such as market instruments could pose additional constraints on growth. Energy concerns are also rising, driven by spikes in fuel prices, supply and security issues, and concerns about fossil fuel emissions contributing to global climate change. Lack of progress in improving the environmental and energy outlook for the future fleet may result in more restrictions via standards or operating limitations on the fleet in service which in turn may depress growth. By contrast, breakthroughs in quieter, cleaner aircraft technologies and renewable fuels could reduce environmental and energy constraints on the forecast, and enable sustainable growth.

APPENDIX A: ALTERNATIVE FORECAST SCENARIOS

Uncertainty exists in all industries, but especially in the commercial air travel industry. As volatility in the global environment has increased, the importance of scenarios for planning purposes has increased. In order to help stakeholders better prepare for the future, the FAA has begun to provide alternative scenarios to our baseline forecasts of airline traffic and capacity.

To create the baseline domestic forecast, economic assumptions for both U.S. and international regions from IHS Global Insight's 30-Year Focus (released fourth quarter 2012) were used to generate enplanements, mainline real yield and nominal yield. To develop the alternative scenarios, assumptions from the optimistic and pessimistic scenarios contained in IHS Global Insight's 10 year alternatives from their January 2013, U.S. forecast were used. The January 2013 forecast reflected the incorporation of the "fiscal cliff" deal that was agreed to on New Year's Day. Inputs from these scenarios were substituted for the baseline scenario inputs to create a "high" and "low" traffic, capacity, and yield forecast.

International passengers and traffic are primarily determined by country specific Gross Domestic Product (GDP) provided by IHS Global Insight. Thus, the baseline forecast of GDP for both the U.S. and international regions is modified using the optimistic and pessimistic forecasts of GDP described above in order to create a high and low case. Since only the ten year alternative GDP forecasts by Global Insight were available at the time of this analysis, both the domestic and international optimistic and pessimistic scenarios extend to 2022 only.¹⁸

Scenario Assumptions

The FAA's baseline forecast assumes that the economy recovers from the current downturn and suffers no major mishaps such as large oil price shocks, swings in macroeconomic policy, or financial meltdowns. The FAA's high case forecast uses IHS Global Insight's optimistic forecast. The optimistic forecast sees faster employment growth and sustained improvements in the housing sector leading to a stronger economy. A credible plan for long-term deficit reduction is enacted, and policy decisions in both Europe and China boost the global economic outlook. In this scenario GDP and real DI growth are about 0.5 and 0.8 percentage points, respectively, faster per year than the baseline forecast and unemployment averaging 1.5 points lower on an annual basis than the baseline (Real DI and unemployment are used as an input variables to the FAA's base, high and low forecasts of enplanements). Conversely, FAA's low case forecast uses IHS Global Insight's pessimistic scenario. In the pessimistic forecast, the U.S. is not able to avoid a prolonged fight over the debt ceiling and in the face of uncertainty,

¹⁸ IHS Global Insight, Short-term macro forecast – baseline and alternatives, released January 4, 2013.

policymakers decide to cut spending. The Eurozone crisis intensifies which reduces the demand for U.S. exports. As the private sector cuts back, housing activity begins to slow and credit dries up, pushing the U.S. economy into a mild recession in early 2013. In this scenario, GDP and real DI grow 0.7 and 0.5 percentage points, respectively, slower per year than in the baseline, and unemployment, on average, is 1.4 points higher on an annual basis than in the baseline.

Real Gross Domestic Product

Source: IHS Global Insight

■ Pessimistic ■ Baseline ■ Optimistic

Real Disposable Personal Income

Oil prices affect the supply of and demand for air travel and have a direct impact on the profitability of the industry. In all three forecast scenarios prices fall over the next few years. In the baseline forecast, oil prices are kept in check as technological improvements act as a counterbalance to rising prices. In the baseline, the refiners acquisition cost (RAC) of oil increases only 1.7 percent between 2012 and 2022, rising from \$103 to \$104 per barrel. In the optimistic case, the price of oil (RAC) decreases at a faster pace through 2015 than in the baseline forecast and then rises more slowly thereafter, resulting in a price of \$94 per barrel by 2022. The high case is characterized by availability of energy, further gains in technology, and a stronger dollar which help to temper prices compared to the baseline. In the low case forecast, a weaker dollar and lower productivity gains create upward pressure in oil prices after 2015. In this scenario, the RAC rises by 38 percent over its 2015 low to \$119 by 2022.

U.S. Refiners' Acquisition Cost

Source: IHS Global Insight

■ Pessimistic ■ Baseline ■ Optimistic

The price of energy is one of the critical drivers in the growth of consumer prices over the forecast period. In the optimistic case the consumer price index (CPI) grows at an average rate of 1.7 percent per year (compared to growth of 1.9 percent annually in the baseline) as energy prices, wages, and import prices grow more slowly than in the baseline. In the pessimistic case forecast the opposite holds with energy prices, wages and import prices rising more rapidly compared to the baseline. As a result, in the pessimistic case, the CPI grows an average of 2.4 percent annually over the forecast period.

■ Pessimistic ■ Baseline ■ Optimistic

Alternative Forecasts

Passengers

In the baseline forecast, system passengers are forecast to grow at an average annual rate of 2.4 percent a year over the forecast horizon of 2013-2022 (with domestic and international passengers up 2.2 and 4.2 percent, respectively). In the optimistic case, passengers grow at a quicker pace, averaging 3.4 percent per year (up 3.2 percent domestically and 4.7 percent internationally). This scenario is marked by a more favorable business environment, lower inflation, and lower fuel prices which make the price of flying more affordable to business and leisure travelers. By the end of the forecast period in 2022, passengers in the optimistic case are 10.3 percent above the baseline. The pessimistic case is characterized by a mild recession in 2013 along with weakened consumer confidence brought on by persistent unemployment, higher energy prices, and higher inflation. In this scenario passengers grow an average of 1.3 percent per year (domestic up 1.1 percent and international up 2.8 percent). In the pessimistic case, system passengers in 2022 are 8.7 percent below the baseline case, totaling 835 million, 80 million fewer than in the baseline.

System Enplanements

Revenue Passenger Miles

In the baseline forecast, system RPMs grow at an average annual rate of 3.0 percent a year over the forecast horizon, with domestic RPMs increasing 2.4 percent annually and international RPMs growing 4.5 percent annually. In the optimistic case, the faster growing economy coupled with lower energy prices drives RPMs higher than the baseline, with growth averaging 4.0 percent per year (domestic and international RPMs up 3.6 and 5.0 percent, respectively). In the pessimistic case, the combination of a slower growing economy and higher energy prices result in RPM growth averaging 1.7 percent annually with domestic markets growing 1.1 percent a year while international traffic grows 2.9 percent annually.

System Revenue Passenger Miles

Available Seat Miles

In the base case, system capacity is forecast to increase an average of 2.9 percent annually over the forecast horizon (with growth averaging 2.2 percent annually in domestic markets and 4.4 percent a year in international markets). In the optimistic case, capacity grows at a faster clip than in the baseline forecast, averaging 3.9 percent annually (up 3.4 percent domestically and up 4.9 percent internationally). Carriers increase capacity compared to the baseline forecast to accommodate increased travel demand brought about by a more favorable economic environment and by the end of the forecast horizon, system capacity in the optimistic

case is 9.9 percent above the baseline case. In the pessimistic case, demand for air travel is lower than in the baseline, thus system capacity grows at a slower pace of 1.6 percent annually (domestic growth of 1.0 percent annually and international up 2.9 percent annually). Total system capacity in the pessimistic case in 2022 is 11.1 percent below the baseline and 19.1 percent below the optimistic case.

System Available Seat Miles

Load Factor

System load factors over the 10-year forecast period are relatively similar for all three forecast scenarios. In the base case, system load factor rises from 82.6 percent in 2012 to 83.9 percent in 2022. In both the optimistic and pessimistic scenarios, system load factor increases from 82.6 percent in 2012 to 83.4 percent and 83.8 percent, respectively, in 2022. In all three scenarios it is assumed that carriers will keep load factors on the high side by actively managing capacity (seats) to more precisely meet demand (passengers). The domestic load factor increases over the forecast horizon from 83.2 percent to 84.9 percent in the base case, and to 84.6 percent in both the pessimistic and optimistic scenarios. The international load factor grows from 81.3 percent in 2012 to 82.1 percent in 2022 in all three scenarios.

Yield

In the baseline forecast, nominal system yield increases 1.4 percent annually, going from 14.20 cents in 2012 to 16.32 cents in 2022. In domestic markets, yield in the baseline forecast rises from 14.00 cents in 2012 to 16.41 cents in 2022, while international yield rises from 14.68 cents in 2012 to 16.13 cents in 2022. System yield rises more slowly in the optimistic case, up 0.6 percent annually to be 15.28 cents at the end of the forecast period. Domestic yield increases to 15.08 cents while international yield increases to 15.69 cents. The slower growth in yield in the high case is due to advancements in technology, gains in productivity, more favorable fuel prices, and lower inflation. Increased competition is also assumed in this scenario. In the domestic market fares are driven lower than baseline levels due to increased market overlap between low cost and legacy carriers. In the international market, increased competition from growing liberalization puts downward pressure on fares. In the pessimistic case, nominal yields rise more rapidly than in the baseline, growing an average of 2.3 percent annually, reaching 16.87 cents by 2022 (16.88 cents domestically and 16.85 cents internationally). This scenario reflects higher general inflation and higher energy prices than in the baseline, forcing carriers to increase fares in order to cover the higher costs of fuel, labor, and capital.

TABLE A-1
FAA FORECAST ECONOMIC ASSUMPTIONS
FISCAL YEARS 2012-2022

Variable	Scenario	Historical		FORECAST					PERCENT AVERAGE ANNUAL GROWTH					
		2012E	2013	2014	2018	2022	2012-13	2013-14	2013-18	2013-22

APPENDIX B: FAA FORECAST ACCURACY

Forecasts, by their nature, have a degree of uncertainty incorporated in them. They involve not only statistical analyses and various scientific methods, but also judgment and reliance on industry knowledge and the forecaster's experience to incorporate industry trends not yet reflected in recent results. The FAA's annual Aerospace Forecast is no exception. Given the volatile nature of the U.S. airline industry, it is not surprising that each year's forecast would contain a certain degree of forecast variance. Therefore, FAA forecasters have tried to build forecast models that give a consistent and predictable pattern of results. Analysts relying on the forecasts produced by the models would then be able to adjust for the predictable variance from actual results.

The table below presents an analysis of the variance from historical results for five key forecast metrics during the FY 2007-2012 forecast period. Although this brief period has experienced industry upheaval, the FAA's forecast methodology remained consistent during this time. For this reason, inclusion of prior periods in an analysis of forecast variance might lead to inconclusive or inaccurate implications about the accuracy of FAA's current forecast methodology.

The table below contains the mean absolute percent errors for the projected values versus the actual results for U.S. carriers' domestic operations. Each metric has five values showing the relative forecast variance by the number of years in advance the preparation of the forecast took place. For example, the "3 Years" column for ASMs shows that the mean absolute percent error was 10.5 percent for ASM forecasts prepared 3 years in advance. For the period under examination, preparation of the forecasts for FY 2007 through FY 2012 occurred in FY 2006, FY 2007, FY 2008, FY 2009, FY 2010, and FY 2011, respectively.¹⁹

¹⁹ It should be noted that the first forecasted year for each respective fiscal year is that very same year. Therefore, FY 2003's first forecasted year is FY 2003, and the third forecasted year is FY 2005.

**U.S. AIR CARRIERS
DOMESTIC SCHEDULED PASSENGER ACTIVITY
FORECAST EVALUATION**

Forecast Variable	Mean Absolute Percent Error (Combined FY 2007 - FY 2012) (Forecast Variance from Actual)				
	Forecast Performed Years Prior to Actual				
	1 Year	2 Years	3 Years	4 Years	5 Years
ASMs	0.6%	5.2%	10.5%	17.1%	21.7%
RPMs	0.9%	4.0%	7.6%	11.9%	15.6%
Passenger Enplanements	0.8%	4.0%	7.7%	12.2%	15.4%
Mainline Yield	3.5%	4.7%	7.4%	4.8%	4.8%
IFR Aircraft Handled*	2.6%	7.5%	11.8%	17.7%	21.4%

*Total - scheduled and nonscheduled commercial plus noncommercial

Presenting forecast variances from actual data in such a manner simplifies a review of longer-term trends. Typically, one would expect the variances to decrease as the forecast year is closer to the year the forecast is prepared. Presenting forecast variances in this way allows an examination of changes in the relative variances by time horizon, signaling when dramatic shifts in accuracy occur.

Examination of the forecast variances reveals several items. First, all the metrics examined show declining variances as the forecast time horizon decreases, as expected. The largest variances were found in the forecasts of ASMs and IFR Aircraft Handled, the variables most directly affected by exogenous events. Second, the ASM forecast variance being larger than the RPM forecast variance indicates a consistent underestimation of load factors, one of the critical elements in converting passenger demand into aviation activity. All other things being equal, large variances in forecasts of load factor will lead to large variances in the long-term forecasts of aviation activity, as can be seen in the variances of the IFR aircraft handled forecasts.

Furthermore, ASMs and aircraft handled are becoming increasingly difficult to forecast beyond a relatively short time horizon, as carriers often react to changing market conditions. The relatively large variances in these forecasts suggest that carriers have been permanently removing capacity by reducing flights and by changing the mix of aircraft to satisfy demand. In the short term, such capacity reductions can be identified by using advance schedule information. However, the FAA's longer-term forecasts rely on anticipated aircraft deliveries and retirements as well as historic relationships between economic activity and capacity deployed. Given the volatile nature of many of the factors that may influence longer term ASM and aircraft handled forecasts, a simpler approach to projecting ASMs, such as RPMs divided by load factors, may improve the long run accuracy of the ASM and aircraft handled forecasts. It should also be noted that the low variance of the mainline passenger yield relative to the other metrics is due in large part to the inclusion of FY 2011-12 in the sample period.

APPENDIX C: ACKNOWLEDGEMENTS

This document was prepared by the Forecasts and Performance Analysis Division (APO-100), Office of Aviation Policy and Plans, under the direction of Mr. Roger D. Schaufele, Jr. The following individuals were responsible for individual subject areas:

Economic Environment	Roger D. Schaufele, Jr.	(202) 267-3306
Commercial Air Carriers		
Passengers	Roger D. Schaufele, Jr.	(202) 267-3306

¹Instrument rated pilots should not be added to other categories in deriving total.

²In July 2010, the FAA issued a rule that increased the duration of validity for student pilot certificates for pilots under the age of 40 from 36 to 60 months.

This resulted in the increase in active student pilots to 119,119 from 72,280 at the end of 2009.

Note: An active pilot is a person with a pilot certificate and a valid medical certificate.
