## Michigan Traffic Crash Facts

Office of Highway Safety Planning  
Michigan Department of State Police

## EXECUTIVE SUMMARY

The 1993 traffic fatality count was 1,414, up 8.8% from the 1992 figure of 1,300. Compared with 1992, injuries were up 13.3% and total crashes were up 5.4%. These figures translated into a death rate of 1.6 per 100 million miles of travel, up from the 1992 death rate of 1.5.

Exposure factors in 1993 showed increases in vehicle registrations and travel mileage and a decrease in the number of licensed drivers. They included motor vehicle registrations up 1.1% to 7.5 million; vehicle travel mileage up 2.0% to 85.7 billion; and the number of licensed drivers down 1.8% to 7.64 million.

Lack of occupant restraint use and use of alcohol continue to be major factors. While the direct observation study reports a 64.4% usage rate, the usage rate recorded by investigating officers on Traffic Crash Reports (UD-10) was 79.0%. Alcohol involvement, especially in fatal crashes, still takes an unacceptably high toll.

Data on crashes in this report were obtained from 1993 Michigan Traffic Crash Report forms submitted by local police departments, Sheriff departments, and the Department of State Police. Other related information was obtained from the Michigan departments of Public Health, State, and Transportation.

This publication was produced for the Office of Highway Safety Planning by the University of Michigan Transportation Research Institute (UMTRI) with data on file at the Michigan Department of State Police as of September 19, 1994. We acknowledge, with great appreciation, all involved agencies for their assistance.

## INTRODUCTION

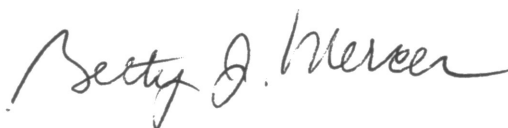

The data contained in this report was submitted by Michigan's 660+ law enforcement agencies on Michigan's Traffic Crash Report (UD-10) for crashes occurring in 1993. We believe the overall quality and reliability of 1993 data has improved from the "transition" year of 1992. Changes to the UD-10 form, enhancements to the computer processing software, and increased levels of accuracy in data submitted by officers in the field have contributed to this improvement.

Michigan's crash processing system allows corrections and updates to the data long after the crash is initially reported to the Criminal Justice Data Center. This results in a "dynamic" crash file, changing as new information about crashes is received. The percentage of alcohol involvement, for example, may differ several months after the data was analyzed by UMTRI and revealed in the form of this report.

Concern about disproportionate increases in 1993 data over 1992 data should be tempered with the knowledge that 1992 numbers may have been artificially low. An estimated 6-10% of the UD-10 forms submitted for 1992 could not be processed due to physical damage to the form or technical problems with the data recorded on the form.

It has been a challenging conversion from a manually processed traffic crash report to one processed electronically using an optical scanner and conventional keypunch operators, but we believe the days of major transition are behind us. The Office of Highway Safety Planning, in Collaboration with its state and local agency partners, will continue to refine and enhance the crash system at every opportunity. We expect to see continued improvement as everyone becomes more familiar with the scannable form and related software.

## 1993 QUICK FACTS

- Some exposure factor comparisons between 1993 and 1992 show motor vehicle registrations rose **1.1** percent, vehicle mileage rose **2.0** percent, and licensed drivers decreased **1.8** percent.
- The 1993 death rate rose to **1.6** deaths per 100 million miles of travel. Although it is an increase over the 1992 death rate of **1.5**, it is well below the five-year average of **1.9** (1988-1992) and ten-year average of **2.0** (1983-1992), and **33.3%** less than the ten-year peak of **2.4** in 1984.

Please note that the *1992 Michigan Traffic Crash Facts* inaccurately reported a 1992 death rate of 1.6. It should have been 1.5, singularly “the lowest in our reporting history”.

- There were **363,636** reported crashes of which **1,269** were fatal type, **91,728** were personal injury type, and **270,639** were property damage only type crashes.
- A traffic crash was reported every **1** minute, **27** seconds.
- Of all fatal crashes, **31.2** percent occurred at intersections.
- Of those fatal crashes where the drinking condition was determined, **32.9** percent indicated that alcohol was a factor.
- In the last five years, **7,332** persons have been killed in Michigan traffic crashes. This is an average of **1,466** per year. During the previous five-year period, **7,622** persons were killed for an average of **1,524** per year.
- Of the **9,478,000** persons living in Michigan [1] one out of every **6,703** was killed in a traffic crash; one out of every **70** persons was injured.
- There were **1,414** persons killed and **134,548** persons injured in **363,636** reported motor vehicle traffic crashes in Michigan during 1993. Compared with 1992 experience, deaths increased **8.8** percent, injuries increased **13.3** percent, and total reported crashes showed a **5.4** percent increase.
- This year’s death toll of **1,414** was up **8.8** percent from the 1992 figure of **1300**.
- The **1,414** persons killed were the result of **1,269** fatal crashes for an average of **1.11** deaths per fatal crash.
- One person was killed every **6** hours, **12** minutes as a result of a traffic crash.
- For each person killed there were **95.2** persons injured.
- There were **134,548** persons injured, crippled, or maimed in crashes.
- One person was injured every **3** minutes, **55** seconds in a traffic crash in Michigan in 1993.
- Excessive speed was indicated as the hazardous action by **15.7** percent of the drivers involved in fatal crashes.
- Of the **1,989** drivers involved in fatal crashes, **11.2** percent were under 20 years of age and **24.6** percent of all drivers involved in fatal crashes were under 25 years of age.

- The pedestrian death toll for Michigan stands at **171** persons. This represents an increase of **1** death over the 1992 figure.
- For each pedestrian killed, there were **16.6** pedestrians injured.
- Of the pedestrians killed, **31.6** percent were killed while crossing streets other than at intersections.
- Of all pedestrians killed, **15.8** percent were under the age of 20 years and **22.2** percent were 55 and older.
- During the past five years, a total of **937** pedestrians have been killed, an average of **187** per year.
- Of the **633,687** drivers and injured passengers involved in crashes, **500,341** or **79** percent were *reported* to have been using occupant restraints. Restraint usage among fatal victims was reported to be **33.6** percent in 1993.
- Children under the age of **15** accounted for **62.1** percent of the bicycle deaths.
- The economic loss in Michigan traffic crashes amounted to **\$12,096,733,393**.

**Historical  
Information**

# 10 YEAR

Vehicle Registrations have been increasing steadily since 1984, reaching 7,495,904 in 1993.

Vehicle miles of travel have increased about 30.4% since 1984, reaching 85.7 billion miles in 1993.

Total crashes increased from 1984, peaking in 1989. Since 1989, total number of crashes has decreased. In 1993, there were 363,636 total crashes statewide.

# 10 YEAR TRENDS (continued)

Deaths in motor vehicle crashes increased for the first time in five years in 1993 after a steady decline from 1988 to a low of 1,300 in 1992. In 1993, 1,414 people died in motor vehicle crashes.

Mirroring the trend in deaths, nonfatal injuries had declined since 1986, to a low in 1992. 134,548 people received nonfatal injuries in Michigan motor vehicle crashes in 1993, up 13.3% from 1992.

After reaching a peak in 1988, fatal crashes declined to 29.1% in 1992. In 1993, there were 1,269 fatal crashes, up 7.6% from 1992.

# 10 YEAR

The percentage of motor vehicle occupants using restraints as reported by police in traffic crashes increased dramatically following implementation of Michigan's safety belt use law. It continued to increase slowly until declining for the first time in 1992.

The number of drivers in Michigan declined for the first time in 10 years. Down 1.8% to 7.64 million drivers in 1993.

After a 10 year high of 2.4 deaths per 100 million vehicle miles in 1984, the death rate per mile driven has declined dramatically. The 1.6 death rate in 1993, is a 33.3% decrease from the 1984 peak.

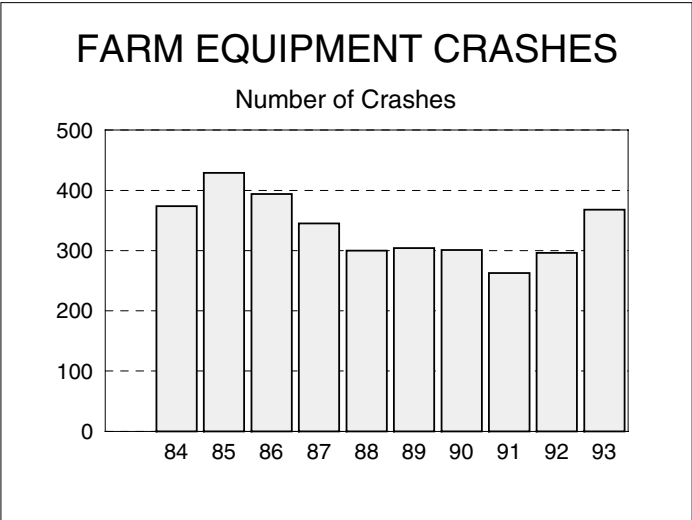

# 10 YEAR TRENDS (continued)

133 vehicle-train crashes occurred in 1993, continuing a pattern of decline since 1989. Train data is provided by the Michigan Department of Transportation.

There has been an 81.2% rise from 26,420 vehicle-deer crashes in 1984 to 47,879 in 1993.

In 1993, there were 368 farm equipment crashes, up 24.3% from the 1992 figure of 296.

## DEATH & INJURY PER CRASH INVOLVED OCCUPANT

The number of deaths and injuries on Michigan roads has remained significantly lower than the peak number in 1988. However, 1,186 occupants of motor vehicles were fatally injured, 15,940 suffered an A (incapacitating) injury, 30,226 sustained a B (nonincapacitating) injury, and 78,563 sustained a C (apparently minor) injury.

Michigan experienced an 8.8% increase in traffic fatalities, as well as a 13.3% increase in injuries and a 5.4% increase in crashes. A 2.0% increase in vehicle mileage contributed to a 7.1% increase in the fatality rate per mile.

The National Safety Council [2] estimated a national increase in traffic fatalities of 3.0% between 1992 and 1993.

## 1993 COST OF CRASHES IN MICHIGAN

The cost estimate for Michigan crashes in 1993 is **\$12,096,733,393**. This figure is based on cost estimating procedures specific to Michigan and produced by the University of Michigan Transportation Research Institute for the Office of Highway Safety Planning. [3] Average comprehensive costs are based on the following figures:

Comprehensive Costs, 1993	
Death .....	\$3,056,530
Incapacitating injury .....	\$201,825
Nonincapacitating evident injury .....	\$45,865
Possible injury .....	\$22,326
No injury .....	\$2,751

The procedures used by UMTRI were extensively revised in 1994, and are not intended for comparisons to prior year's cost estimates.

### ALL CRASHES BY INJURY SEVERITY

### HBD CRASHES BY INJURY SEVERITY

The problem of the drinking driver, pedestrian, and/or cyclist is seen when one compares the two charts on this page. A fatality in the crash is six times more likely when one of the crash-involved operators is reported as had been drinking.

# DEATH & INJURY PER CRASH INVOLVED OCCUPANT

## Occupants in Crashes

The majority of people involved in crashes (79.1%) are not injured. More than half of those who are injured receive only minor (C) injuries. Increased use of occupant restraints and airbags can reduce the number of killed and injured even further.

## Occupants in HBD Crashes

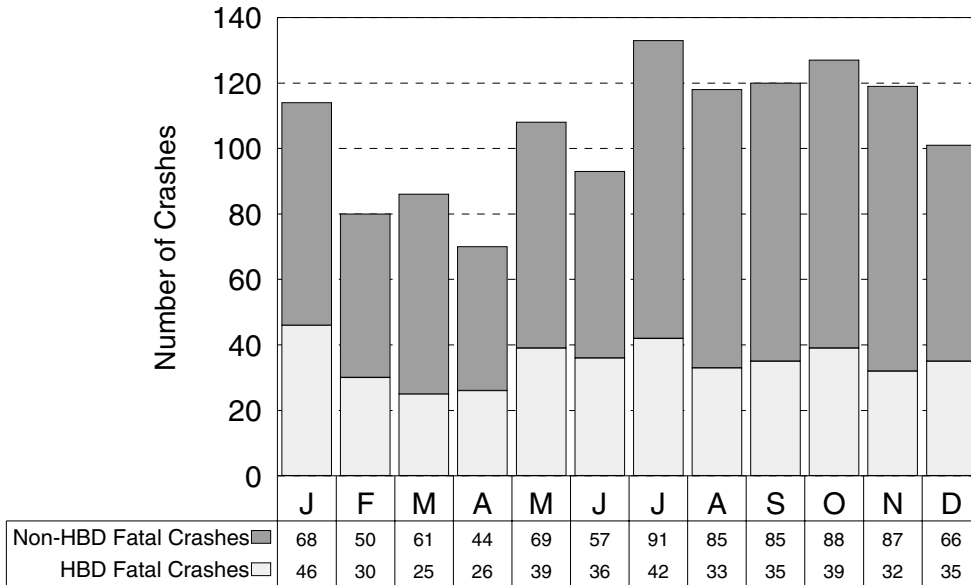

Crashes involving drinking tend to be more serious than nondrinking crashes. The percentage of fatalities is five times higher than in all crashes and the more serious injury levels are three to four times higher.

## ALCOHOL INVOLVEMENT IN FATAL CRASHES

Fatal crashes were lowest in number during February, March, and April. The number of fatal crashes then increased, peaking in July. These numbers follow the increase in travel during the summer months. The number of HBD fatal crashes by month does not show a discernible trend. Total persons killed in fatal crashes closely follows the number of crashes, as would be expected.

### Fatal Crashes by Month

### Total Persons Killed by Month

### HBD Fatal Crashes by Day of Week

Friday has the most fatal crashes in 1993. Saturday and Sunday have the highest proportions of drinking related fatal crashes. Almost half of weekend fatal crashes involved drinking, while only 22.2% of fatal crashes on Wednesday involved drinking.

### HBD Fatal Crashes by Time of Day

Not surprisingly, the midnight to 3:00 AM time period has the highest rate of drinking involvement (63.4%), while the late morning hours are the lowest (3.3%).

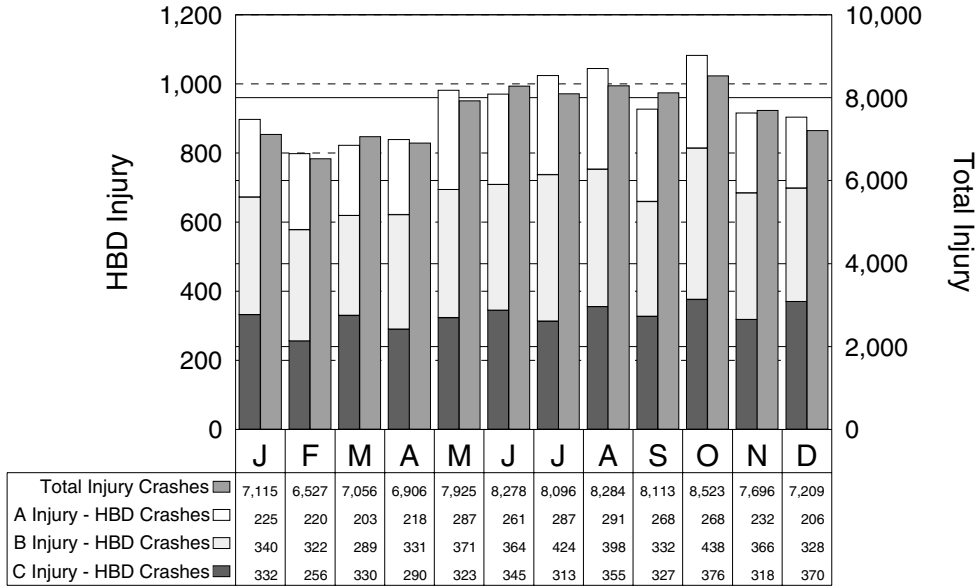

They were 15 fatal crashes, where the time of day was unknown. Of these 15 fatal crashes, 9 were HBD.

## ALCOHOL INVOLVEMENT IN INJURY CRASHES

Alcohol involvement in injury crashes is an important indicator of the alcohol impaired driving problem. In 1993, HBD Injury crashes were highest in July, August, and October, with over 1,000 HBD Injury crashes in each of those months. The highest proportion of HBD Injury crashes occurred in October with 12.7% of the injury crashes involving alcohol.

### HBD Injury Crashes by Month

### Total Persons Injured by Month

HBD Injury crashes follow the same basic trends as total crashes seen in the following charts. Crash frequency peaks on Friday, Saturday, and Sunday, and in the hours between 6:00 PM and 3:00 AM (12:00 AM - 3:00 AM is a particularly hazardous travel period).

### HBD Injury Crashes by Day of Week

### HBD Injury Crashes by Time of Day

## ALL CRASHES INJURY SEVERITY BY MONTH

The charts on this page show that the months of June, July, August, September, and October are peak months in terms of the ratio of the number of crashes involving death or injury to the number of non-injury crashes. That is, if a person was involved in a crash in June - October, there was a higher chance of that crash resulting in death or injury to one of the involved persons than if that crash happened during one of the other months.

# VEHICLE TYPES IN CRASHES BY CRASH SEVERITY

## FATAL

The top chart shows that 4 out of 5 vehicles involved in fatal crashes are automobiles or pickups. Van, Motorhome, the vehicle type that includes the popular Mini-van, has a fatal crash involvement of 6.9%.

## INJURY

As with fatal crashes, Injury and PDO crashes are predominated by cars and pickups. One should also note the decline in proportional representation for motorcycles and heavy trucks compared to their levels in fatal crashes.

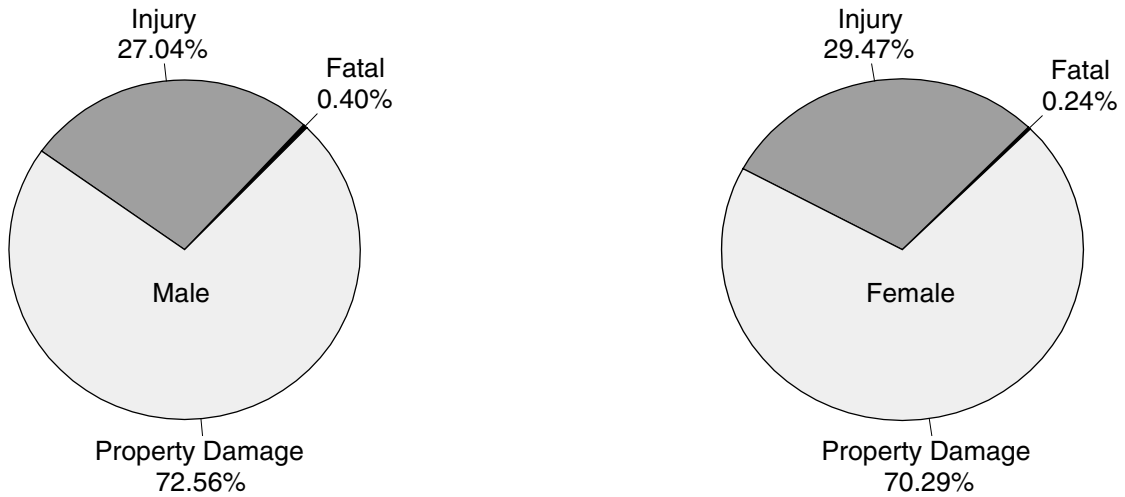

## PROPERTY DAMAGE ONLY

## DRIVER GENDER INFORMATION - ALL CRASHES

### Crash Severity

A higher proportion of crashes involve male drivers than female drivers. When we examine the severity of crashes involving drivers of each gender, we see that fatal crashes are twice as prevalent among male drivers than female drivers (0.4% vs. 0.2%).

This year's chart was processed with numbers for all drivers (vehicle level). The 1992 numbers reflect the drivers of vehicle one only (crash level).

## CRASH EXPERIENCE BY ROADWAY TYPE

The table below provides a detailed breakdown of estimated vehicle mileage, crashes, death rates (deaths per 100 million vehicle miles), and crash rates (crashes per 100 million vehicle miles) for the major roadway types in Michigan. All rates are lowest on limited access highways. 1993 estimated mileage figures were provided by the Michigan Department of Transportation [4].

### Driver Injury Severity - Not Ejected

### Driver Injury Severity - Ejected

As can be seen in the two charts on this page, death and injury are much more likely when drivers are ejected from their vehicles.

## DRIVER HBD - NOT EJECTED vs. EJECTED

Driver HBD Injury Severity - Not Ejected
