## PREFACE

As Chairmen of the Metro Finance Task Force and its Technical Advisory Committee, we would like to thank the members of our committees for the extraordinary commitment they made to our study of Washington area transit finance. This effort began more than nine months ago, and in the ensuing weeks and months, members of our committees have given literally thousands of hours of their time to the task of reviewing documents, attending meetings, and sharing their insights and judgments with the Federal City Council staff and our consultants.

We also would like to thank those who appeared before our committees: representatives of the Federal government, the States of Maryland and Virginia, and the District of Columbia, local government officials, and numerous staff members from the Washington Metropolitan Area Transit Authority. Their presentations were uniformly excellent and they have contributed greatly to our efforts.

Finally, we would like to single out our consultants for particular praise. Each of them--Jeff Bruggeman, Bob Peskin, Ray Ellis, and Bruce Williams from Peat, Marwick, Mitchell \& Co.; Phil Dearborn from the Greater Washington Research Center; and George Wickstrom, Ron Sarros, and John McClain from the Council of Governments--worked tirelessly to ensure that our final product is worthy of broad-based support.

When we began this study last May, we committed ourselves to producing an honest, hard headed, realistic set of numbers regarding our region's future transit costs. We believe that we have accomplished our mission and we have done so by involving all the affected parties in the process and by reaching concensus at every major milestone. We feel confident that this study will enable the region's decision makers and the public at large to make better informed judgments about the future of mass transit in the Washington Metropolitan area.

## I. INTRODUCTION

The principal goal of the Federal City Council's study of transit finance in the Washington metropolitan area is to achieve a regional consensus regarding what the region's total transit costs and revenues are likely to be through the year 2000. In addition, the study looks at how well prepared the jurisdictions will be to assume their respective shares of the operating deficits and capital costs. The Federal City Council brings to this study impartiality and objectivity and broad familiarity with transit issues in the Washington area.

Currently, there is no single set of projections of future transit costs upon which decision makers at all levels of government --local, state, and Federal--can agree. The need for a commonly agreed upon, objective set of numbers is compelling, especially in light of proposed cutbacks in Federal transit assistance.

The Council believes that its study is particularly timely inasmuch as portions of the Metrorail system have now been in operation for 10 years and there is a wealth of real data against which to judge projections of future costs and revenues.

The study is being conducted under the auspices of the Council's Metro Finance Task Force, which is chaired by Mac Asbill, Jr., a partner in the law firm of Sutherland, Asbill \& Brennan. The Task Force is the policy setting body for the study and is made up of 25 members of the Federal City Council and four public sector officials: Gladys Mack, a member of the WMATA Board and its Chairman during 1985; John Milliken, a member of the Arlington County Board and a former WMATA Board Chairman; David Wagner, Deputy Secretary of the Maryland Department of Transportation; and Ralph Stanley, Administrator of the Urban Mass Transportation Administration (UMTA).

The Task Force, using funds provided by UMTA, retained three consultants to undertake the detailed technical analyses. Peat, Marwick, Mitchell \& Co. was responsible for the transportation, revenue, and cost analyses; the Greater Washington Research Center undertook the financial projections; and the washington Metropolitan Council of Governments provided data and logistical support.

The Task Force's efforts have been supported by the work of a Technical Advisory Committee (TAC), which is composed of transportation analysts and finance officers from every local jurisdiction and the States of Maryland and Virginia. The TAC, which is chaired by Fairfax County Transportation Director Shiva K. Pant, advises the Task Force with respect to technical issues and makes recommendations to the Task Force.

Since the transit finance study began last May, the members of both the Task Force and the Technical Advisory Committee have held more than 20 meetings and have given literally thousands of hours of their time to this effort on a strictly voluntary basis.

Travel behavior and transit patronage are influenced by a number of factors including population and employment growth, the level of transit service available, and automobile ownership.

With respect to population growth, the 1990 population forecasts used in the 1974 Net Income Analysis (NIA) were significantly higher than the 1990 forecasts used in the current study. The current 1990 forecasts, which are based upon the Round III Update, project a population of approximately 900,000 in the core jurisdictions (D.C., Arlington, and Alexandria) and slightly more than two million in the inner suburbs (Montgomery, Prince George's, Fairfax, Fairfax City, Falls Church). The current 1990 population estimate of slightly more than three million is nearly 20\% less than the 1990 estimate that was used in the 1974 NIA.

Regarding employment growth, there is dramatic projected increases in the Washington region but most of the employment growth is occurring beyond the Beltway, in areas that are not well served by public transit. As shown in Exhibit 2.1, only modest employment increases are projected within rings 0-3, the so-called 10-mile square comprising the District, Arlington, and Alexandria. Growth continues strong in rings 4 and 5, which are just inside and outside the Beltway, respectively, although at a slightly slower rate than during the past decade. The most dramatic growths are predicted for rings 6-8, the outer-most portions of the region.

Furthermore, the distribution of employment growth differs significantly from that projected for the 1974 NIA, as shown in Exhibit 2.2. For example, officials of the District of Columbia now are projecting a 1990 employment base of 692,000 jobs, which is $22 \%$ fewer than the 887,000 jobs projected in the 1974 NIA. Rings 4 and 5, on the other hand, are projected to have 84,000 and 89,000 more jobs, respectively, than were projected in 1974. Thus, in comparison to the 1974 estimates, the current study anticipates that nearly 175,000 jobs that were expected to be created in the region's core, in all likelihood will be located in areas that are not well served by transit.

The location of both population and employment growth is of critical importance to transit because there is a significantly higher propensity to use transit in the region's core areas than in the outlying areas. For instance, in 1980 more than $40 \%$ of the work trips to downtown Washington were made via public transit, while fewer than $10 \%$ of work trips in the suburbs were made on public transit. Nearly 9 of every 10 transit work trips in the Washington area have destinations in either the District or Arlington, and 95\% of transit work trips have destinations inside the Capital Beltway. Thus, the location of future employment growth is one of the key factors affecting transit patronage; transit captures a significant percentage of work trips destined for the core but has been somewhat limited in its

EXHIBIT II.I
EMPLOYMENT CHANGE BY DECADE 1972-1980

ability to capture a large percentage of work trips in the less densely populated areas beyond the Beltway.

Another factor influencing travel behavior and transit use is automobile ownership. In the last 10 years, there has been a significant decline in the number of households in the Washington area in which there is no automobile. The significant increase in overall auto ownership coupled with the decline in zero-car households are additional factors that explain why current estimates of future transit ridership are substantially lower than forecasts made during the 1970's.

Apart from lower population and employment growth in areas that are well served by transit, the share of trips made by transit is also less than in previous estimates. Earlier projections that showed a higher mode split reflected a significantly greater amount of Metrobus service than is likely to be available in the future. The level of line-haul and feeder bus service assumed in previous studies was $50 \%$ higher than is presently forecast. The 1974 NIA projected more than 70 million vehicle miles of Metrobus service upon the rail system's completion, while the present study projects 46 million vehicle miles of service. Regarding Metrorail, earlier estimates of rail running times were understated when compared with actual experience, resulting in "crediting" transit with 10\% faster travel times than are actually occurring. Thus, the lower level of bus service and the slightly longer running time for rail service are important factors in explaining the current projections of future transit ridership.

As the foregoing make's clear, previous estimates of future transit patronage were based upon a number of assumptions about the way in which the Washington area would evolve that have not proven to be correct. As one assesses travel behavior in the region, it is important to understand the degree to which this behavior is being shaped and will be shaped in the future by the underlying demographic and employment shifts that are occurring.

## INTRODUCTION

Transit operating statistics are the key to analyzing the finances of transit systems in the Washington area. The operating statistics directly measure the quantity of transit service provided and thus determine operating costs. The operating statistics also are used to determine fleet size and utilization which, in turn, determine the capital requirements for purchasing and rehabilitating the transit fleet.

Three sets of transit operating statistics were developed for this study: Metrorail, Metrobus, and local bus. For all three sets, the most important statistics for analyzing cost are vehicle miles and vehicle hours of service. Fleet size is required for capital cost estimation purposes. Operating statistics are developed on a daily basis from schedules of transit service and then expanded to an annual basis for financial analysis.

Operating statistics were computed for several key years that correspond to major milestones in the evolution of the Metrorail system. These points are:

- current (summer of 1985) conditions;
- near term (1987/1988) conditions;
- post Stark-Harris (1993) conditions; and
- full system (2000) conditions.

The near term conditions include the full impact of opening the Vienna extension of the Orange Line and some other fairly minor adjustments to transit service levels. The post Stark-Harris conditions represent operations after completing 89.5 miles of the rail system while the full system conditions reflect the full 103-mile Metrorail system.

The operating statistics summarized in this report were prepared by Peat Marwick based upon inputs received from WMATA and the staffs of the local jurisdictions. The bus statistics adjustments were computed on a route-by-route basis and reflect the approximate effect of changes in route structure due to to Metrorail extensions and other factors. Data for the Vienna corridor were taken directly from a detailed analysis done by WMATA staff. Impacts for the other system changes were calculated by Peat Marwick and were based on a somewhat less detailed route analysis.

## Analysis Approach

The bus operating statistics were computed by first assembling weekday, Saturday, and Sunday operating statistics by route groupings from materials developed by WMATA. These statistics, which include miles and hours of services by jurisdiction of allocation and operating division (garage), were summarized on a LOTUS 1-2-3 microcomputer spreadsheet for further analysis.

Changes in bus service concepts were obtained from the staffs of the local jurisdictions. These were converted into approximate changes in miles and hours of service by Peat Marwick, using current schedules and available maps. Preliminary near-term service changes for the Vienna corridor had already been computed by WMATA staff and were used directly in the analysis.

Near-term statistics were computed for daily and weekend services. Longer term changes in response to Metrorail extensions were computed only for weekday service. Annualization factors by operating division were computed from the current and near-term service patterns, were assumed to hold for the future, and were applied to the Stark-Harris and full system weekday estimates.

In making these calculations, the changes were made to the revenue service components of each route and applied to the daily statistics. Thus, the non-revenue portions were held constant which seems a reasonable assumption since most of the service areas were not changed significantly. For routes that were more extensively modified, the relationship between revenue and total statistics from the 1985 schedules were applied to the revised revenue service estimates.

## Near-Term Changes

Major near-term changes include the shift of major portions of Huntington service from Metrobus to Fairfax County operation in September 1985 and service changes associated with the opening of the Orange Line to Vienna in 1986. Other changes noted by the staffs of the local jurisdictions were very minor.

## Huntington

The Huntington changes were anticipated in the July 1985 Metrobus operating plans with route realignments and statistics computed so that entire route groups would switch from Metrobus to Fairfax County bus operation. Services to the Pentagon and beyond still are operated by Metrobus since most are shared routes between Fairfax County and Alexandria.

## Vienna

Proposed changes in Vienna service with the extension of the Orange line have been prepared by WMATA staff for use in preliminary discussions with the affected communities, prior to formal public hearings. The major changes are summarized below; a more detailed analysis is included in Appendix A:

- Outlying express routes to Ballston via Arlington Blvd. and I-66 would be converted to feeders to the Vienna, Dunn Loring, and West Falls Church Metrorail stations. Additional feeder routes would be added particularly in the Oakton/Vienna area and to serve employment centers in the Arlington Blvd./Beltway area.
- Reston services would be terminated at West Falls Church. Additional service changes and extensions would be made in the Reston/Franklin Farms area.
- Tysons express to downtown Washington and route 66X express service from West Falls parking lot to Rosslyn would be discontinued.
- New express service would be added from Centerville.
- Various route modifications would be made throughout the corridor to serve Metrorail stations and provide replacements for revised express services.

## Other Near-Term Changes

Other service changes were identified by the staffs of the local jurisdictions. Some have been implemented recently while others represent likely near-term actions:

- L8: Connecticut Avenue service. Reduction in peak service.
- N9: Montgomery Mall express. Reduction in peak service.
- A12: Landover area. Extension along Landover Road beyond the Beltway to serve new development.
- C11: Clinton express. Extension southward to serve Clinton area plus additional runs from September schedule.
- T19: Bowie area. Deletion of service to Crofton. Addition of service from new park and ride lot near US50 and MD197.

## Stark-Harris System Changes

Changes in Metrobus services to reflect extensions of rail service to Wheaton, Anacostia, Van Dorn, and Greenbelt were
discussed with the staffs of the ioczl jurisalatirns. The following changes were identlfaed, most of which are monetert with the assumptions beinos used by MwCor in its dovel rant of a 1990 transit network for regional modaling.

## Wheaton

Wheaton service changes were discussed with staff of Montgomery County DOT and include the following:

- X5, 7,9: Georgia Avenue. Terminate at Wheaton station.

O Q4: Viers Mild. Terminate at Wheaton station.

- Z: Columbia pike services. All cxpress service in peak: from Brigras-Chancy Roaito jilver Efrint. This service is indeprinclent wif the Wheaten orening an woula rehably

Van Dorn
Discussions with Alpxanaria ari farrax satat firincaterathat major bus serviae chanues woukik n-t bikelyke re parel ior قan Dorn. Therefore, the only service whange is the adaitional service from the mayfield ared to the station ineluded in the MWCOG network.

Anacostia
 Columbia and Frince Georse's C゚runt $\because$ Statis. Ihe han ie. are summarized below; more detail is yrouitolin AEfeniix A:
o Most Anacostiaserviees in the nistriut andit of

 Crosstown routes woulske brotirn at tho An? station.
 Clinton express semvice whul : be thrme 1 burat anacost:a station.

 Beltway.

## Greenbelt

Greenbelt service change: were bianussek with Irime ar raco staff in detail and discussed briefly with nistrict ot columbia and Montgomery county stalt. The changes axe summar:zo bea in; more detail is provided in Appendix A:

- Most services in the Chillum and Hyattsville areas would be rerouted to the Prince George's Plaza or West Hyattsville stations rather than Red Line stations in Northeast D.C.
- Greenbelt and Laurel services would be rerouted to Greenbelt station.
- Additional service added from Laurel area to Greenbelt station.

## Full System Changes

Metrobus service will change with the completion of the full Metrorail system (extension of the Red Line from Wheaton to Glenmont; extension of the Yellow Line from Van Dorn to Franconia; extension of the Green Line from Anacostia to Branch Avenue; and completion of the Green Line from U Street to Ft. Totten). The following Metrobus service changes were assumed to be made in connection with these rail service changes:

## Glenmont

Glenmont service changes were discussed with staff of Montgomery County DOT and include the following:

- Y5,7,9: Georgia Avenue. Terminate at Glenmont station.
- Z: Columbia Pike services. Additional express service during peak hours from Briggs-Chaney Road to Silver Spring. This service is independent of the Glenmont opening and would probably be in place by the mid 1990's.

## Franconia

No plans for service changes for the Franconia station have been developed by Fairfax County. It was felt that users of current Shirley express services would oppose terminating these routes at the Franconia station because this change would result in a longer and more expensive trip to the Pentagon and beyond. Therefore, the only service changes are two additional feeder routes:

- West Springfield service from Rolling Valley Mall to Franconia station, tying in with various 18 routes along Old Keene Mill Road.
- Local service from Lorton via Alban Road and Loisdale Drive, tying in with Lorton and Saratoga services.

## Branch Avenue

Branch Avenue service changes within the District of Columbia were outlined by D.C. and WMATA staff. Service changes in Prince George's County were discussed with County staff. Incremental
changes beyond those included for the Anacostia opening are summarized below and are described in more detail in Appendix A:

- Most Anacostia routes in the District would be revised or extended to serve the Congress Heights, Southern Avenue, or Naylor Road stations.
- Indian Head/South Capitol Street regular services from Prince George's County would be rerouted to the Southern Avenue station. Oxon Hill express services would remain at the Anacostia station.
- Marlow Heights and Hillcrest Heights services would be rerouted to the Suitland station rather than Potomac Avenue.
- Clinton express would be rerouted to theBranch Avenue station. Camp Springs and Suitland Road services would be extended to the Branch Avenue station.
- New express service assumed from Andrews AFB to the Branch Avenue station.

Columbia Heights (Green Line North)
Bus revisions with the opening of the Green Line to the Columbia Heights and Georgia Avenue stations were outlined by District of Columbia and WMATA staff. These are summarized as below and described in more detail in Appendix A:

- l4th Street services would be revised to serve the Columbia Heights station. Through service to the Navy Yard would be discontinued.
- Petworth services would be cut back at the Georgia Avenue station and Petworth express would be eliminated.
- Georgia Avenue, llth Street, and New Hampshire Avenue services would be revised to serve the Georgia Avenue station. Service south of the station would be reduced.
- Various crosstown routes and special services would be revised to serve the Columbia Heights station.

A summary of the bus statistics for 1985, near-term operations, Stark-Harris system, and full system are shown in Exhibit III.1.

## EXHIBIT III.I

Montgomery County and the City of Alexandria operate local bus systems and Fairfax County recently began operating a system in the Huntington area. Each of these jurisdictions was contacted about anticipated changes in their local bus system's operation. In addition, the staffs of Arlington County, Prince George's County, and the Djctrict of Columbia were asked about local bus wervices for thei. jurisdictions. None of these jurisdictions indicared - eectfic plans for local bus services, but all acknowledged that the issue is a significant one, given the growth of local bus services in the other jurisdictions and its impact on the allocation of remaining Metrobus costs.

Montgolnery County has extensively expanded Ride-on service over the bact few years but foresees only minor changes in the overall 1 of service in the next few years. Some service adjustments Uill be made, but within the current overall level of fleet uvailobility and operating statistics. Some minor expansion is expected following the opening of the Wheaton and Glenmont stations, primarily to provide new service to the northeast. lncreasing the fleet growth of about 10 vehicles with the issoclated increases in miles and hours is expected to provide for the expanded service in this area and elsewhere in the courty

R Mrandria is also fairly well set with its system. Most of the when routes in the city are jointly allocated with either noifin or Arlington countios and do not lend themselves to amothation by city service. A new route will be developed in $10 \%$ Comer..n Valley area by 1990 , however, and will be extended to arge the Van Dorn station when the Yellow Line extension is (.... No firm plans exist for other major service a all mations, although some service adjustments within existing mourcos; will likely continue to be made to tailor service to shommind faterns.

Fdiryax County service in the funtington area began late in Fillumber. No additional major changes to this service are whi, ipated, although minor route refinement will continue as 7llmahip patterns in the corridor evolve. The county is a.u.rering expanding its local bus service to the Vienna and somiogiteld areas, but no commitment to these changes has been Thinde In addition, the county is studying the potential for mavirting some Metrobus service to contract carrier service in 7rnas such a. Reston. Areas being considered for this type of onvice i, a somewhat difterent service, equipment, and cost matern fan more localized rail feeder services in the Munt intaton and vienna aroas.

WMATA provided a set of rail operating assumptions and then computed rail operating statistics for each planned extension of Metrorail service. Among the key assumptions used to generate these statistics are the following:

- The construction schedule as included in ICCA-IV.
- Hours of operation:
- Weekday: 18
- Saturday: 16
- Sunday: 14
- Frequency of service from terminals:
- Peak: 6 minutes, all lines
- Off-peak: 8 minutes, Red Line, single service 12 minutes, all other lines
- Train consists:
- Weekday: 4-, 6-, and 8-cars until December, 1993; 6- and 8-cars thereafter.
- Weekend: 4-cars.

These statistics were based on previous WMATA assumptions concerning future ridership which turned out to be somewhat higher than that produced by the present study. Therefore, Peat Marwick revised the assumed train consists to provide more balanced supply and demand at the peak load points. These adjustments eliminated the need for 8 -car trains and retained a mix of 4-car and 6-car trains throughout the projection period, with most service provided by 6-car trains by the completion of the full system. The final operating statistics for Metrorail service are summarized in Exhibit III.2.

EXHIEIT III. 2

## IV. RIDERSHIP AND REVENUE

Patronage and revenue forecasts for the study of transit finances in the Washington area were developed using data developed by the Metropolitan Washington Council of Governments (MWCOG) and a microcomputer based analysis system developed by Peat Marwick. The patronage forecasts were developed using data from the 1980 census. Then techniques were used to project 1985 ridership which was compared with WMATA's 1985 survey results. The techniques were then used to project transit ridership for 1993 and 2000, years that represent major milestones in the development of the Metrorail system.

## AREA SYSTEM

Analysis of travel patterns requires establishment of an area system to summarize travel data and project transit shares. The geographic coverage of the analysis corresponds to MWCOG's modeling area, which consists of the District of Columbia, Arlington County, Alexandria, Fairfax County, Falls Church, Fairfax City, Prince William County, Loudoun County, and most of Montgomery and Prince George's counties. The extreme northern part of Montgomery County and the extreme southern part of Prince George's County are excluded, based on analysis decisions made for the 1968 home interview survey, the last comprehensive travel survey performed in the metropolitan area.

MWCOG has broken up the metropolitan area into a series of small traffic zones (about 1400 in number) and has aggregated the zones into 182 districts (including outer Montgomery and Prince George's counties). The zonal level provides a superior level of detail but requires far too large a data base and very significant computer resources. Therefore, the study was designed to work with district level data.

Several shortcomings in the district area system were noted for transit forecasting. The district boundaries did not adequately separate travel by rail corridor, particularly in the eastern portion of the District and northern Prince George's County. Also, the district area system did not honor the political boundaries of Falls Church and Fairfax city and did not reflect the emerging suburban employment centers. Also, the district system included detail in Loudoun and Prince William counties that was not needed for transit demand forecasting.

As a result, a revised area system was developed at about the same "grain" as the MWCOG district system but with some boundary adjustments to better reflect transit service areas. A total of 174 districts were identified, the adjustments honoring MWCOG zonal boundaries. District-level travel data were collected from MWCOG, as noted below, and zonal-level socio-economic data were used to adjust the district boundaries to the area system used in the analysis.

were prepared to assist in verifying the 1985 model results. MWCOG has also geo-coded the home-end of the rail survey trip records and an additional data summary was made with information aggregated for the 174 districts.

Data on on trips made entirely on Metrobus and on trips made on the local and private bus systems are not available in as convenient a form as the information obtained from the rail survey. Data from the 1980 census refers to all transit travel and does not indicate transit mode, nor does it provide information on non-work travel. Thus, the modeling and verification activities were hampered by this lack of consistent information.

## NETWORK DEVELOPMENT

The representation of transit service in the region required the development of transit networks for the years 1980, 1985, 1993, and 2000 that reflect the status of the Metrorail system as well as major Metrobus, local bus, private bus, and commuter rail services. The transit network modeling was undertaken using a microcomputer network analysis package developed by Peat Marwick that performs the same essential functions as the UMTA-supported UTPS package on a mainframe computer.

For the modeling activity, the transit networks were coded to the 174 districts used in the analysis. The Metrorail system was represented with rail station locations and station-to-station travel times and headways obtained from WMATA. The bus system was abstracted somewhat since a full level of detail was not required for an analysis at the 174 district level. Most Metrobus routes were represented, although some minor subroutes were combined and some purely local service routes were not included. Similarly, many local and private services were reflected, but in some cases a single representative route from among several serving a particular district was included. This level of abstraction was particularly used in southern Montgomery County where the Ride-on route density is higher than the geographic "grain" of the area system.

Current Metrobus and local services were coded from existing schedules to obtain route headways and travel times between major time checks. All services were coded for the A.M. peak condition, since work trip modeling in "production-attraction" format was used, as described in Section 4. Headways were generally rounded to an even number of buses per hour and generally reflected an average over the 7 - 9 A.M. period.

Future Metrobus and local bus service orientation and headways were taken from the inputs received from the local agencies as noted above. Travel times were generally not changed from the current, except for routing changes to serve rail stations and a time savings for a few express services with the extension of the Shirley Hov lanes. A limited amount of additional information for 1980 conditions was obtained from old schedules at WMATA.

These data were particularly useful for identifying service patterns in the Shady Grove and Huntington corridors, the areas most affected by Metrorail openings since 1980.

Traditional network analysis includes two alternative transit paths, one for those users who board transit directly from their homes and the other for those who use an automobile to reach a Metrooail station, commuter rail station, or satellite parking lot. In this approach, travel times are computed for both transit paths, transit mode split is determined by a composite impedance, and route assignments are made to both paths and aggregated.

Using this approach, the model's initial results overestimated Metrorail ridership. Observation of traveler behavior indicated that the overestimation was due, in part, to the fact that the transit path selection, using conventional transit modeling techniques, was based on minimum time. In the Washington network, however, transit fare policies lead to significantly different fares for some interchanges between bus and rail. Since excellent bus service is still provided in many parts of the region, even areas with Metrorail service, it is likely that many users prefer to make their trips entirely on Metrobus, which may be slower but costs less than a combined bus-rail trip.

The overestimation of rail ridership was dealt with by developing a third transit path for all-bus travel. This path was determined simply by deleting the rail service and finding the minimum time path from the remaining bus services.

The transit networks were also used in developing the fare inputs to the mode split estimation process. Transit fares in the Washington area are dependent upon mode, time of day, trip origin and destination, and sometimes service class and other special features. The network analysis process was adapted to produce a "trail" indicating the transit modes and routes used on all three paths so that the appropriate fare could be computed. Among the outputs produced are the rail boarding and alighting station for computing Metrorail fares, fare "flags" for usage of surcharged services such as the Reston system, and "flags" for usage of private bus services and commuter rail. Treatment of Ride-On, DASH, CUE, and Fairfax Connector services was accomplished largely outside the network process since the services are more geographically isolated.

The current transit fare structure was assumed to remain unchanged over the next 15 years. A 1980 fare table was developed from the tariff in effect at that time for use in the "pivot" to create 1985 mode split estimates. The most significant change in fare policy since 1980 was the introduction of a "taper and cap" on rail fares in 1984.

Additional specialized usage of the network analysis package was employed in the allocation of bus revenues to jurisdiction. This
application involved "flagging" certain routes with special allocation codes, in order to to identify which interchanges were associated with the particular routes so that revenues could be allocated appropriately.

## WORK TRAVEL DEMAND MODELING

The approach to work travel demand modeling used in the study was based on the application of a "pivot point" technique developed for MWCOG. The pivot technique is used to estimate the change in mode split from a base line value due to changes in transit service measures. The technique is based upon a mode split formulation called a "logit model". A simplified logit formulation was specified for MWCOG for use in pivot applications and was adapted for this study.

This model calculates the projected share of travel on an interchange that would be made by transit, termed transit "modal split"; as a function of the base mode split and changes in transit travel times and fares, termed "impedances". The "pivot" technique and the associated coefficients used in the study are shown in Appendix B.

In applying the model, the base mode splits were taken directly from the 1980 census work trip data, simply by dividing the transit trip estimates by the person trip estimates for the 174 by 58 interchanges used in the analysis. Changes in impedances were determined from the results of the network analysis. Fare changes were converted to 1968 dollars using a simple CPI deflator of . 3228 .

The application of the pivot technique is complicated by the fact that transit travel times and fares are considerably different for users who walk to local services as compared to those who arrive at major transit facilities by automobile, as noted above. However, the 1980 base mode split information from the census is only for total transit travel, completely undifferentiated by mode of access, bus vs rail, Metrobus vs local bus, WMATA vs private services, or any other categorization.

In order to deal with the mode of access issues, a weighting procedure was used to combine the impedances. This weighting was accomplished by computing the change in impedance on two paths, weighted by the assumed mode of access percentages estimated from rail survey data. The weighting function is further complicated by changes in the mode of access percentages likely to occur with introduction of new or superior transit services. The weighting procedure adopted is summarized in Appendix B.

The weighting procedure also treated the third transit paths for travelers who did not use the rail system. It was assumed that the trade-off between time and cost would occur primarily for those users who were able to access the transit system at their place of residence and thus was only applied to the "walk access" paths. An exception was made for those users with direct access
to Metrorail for a trip which required a bus transfer at the destination end to complete the trip. The time-cost trade-off for making such a trip entirely by bus was included in the analysis.

For the mode split estimates in the pivot technique, a "best" path was identified from the "walk access" and "all-bus" impedances. The "best" path was determined by computing the weighted impedance using the model coefficients and the network values for in-vehicle time, out-of-vehicle time, and fare.

The pivot technique was applied to estimate a revised mode split. The revised mode split was then multiplied by the future work person trip tables to obtain a total transit trip table. Total transit trips were split between the "walk access" and "auto access" paths using the same mode of access percentages used in the calculation of the weighted impedance.

An additional allocation was required between the "walk access" and "all-bus" networks. For purposes of this analysis, allocations were made only for those trips where a time-cost trade-off existed; that is, trips where the "walk access" path was quicker but more costly than the "all-bus" path. For interchanges where the "all-bus" path was quicker, it would have been the minimum time path and no rail would have appeared on the interchange. For interchanges where the "all-bus" path was both slower and more expensive, all trips were assumed to be made on the "walk access" path. For any situations where the impedances were equal, the trips were split $50 \%-50 \%$ to both paths.

A simple function was developed for the trade-off interchanges using the impedances and the coefficients. The function is shown in Appendix B together with some typical time-cost trade-off values.

Initial model results somewhat overestimated work trips and underestimated non-work trips. One likely explanation is the significant decrease in automobile operating costs between 1980 and 1985. Since a pivot model was being used in the analysis rather than a complete mode split model, no direct mechanism existed for adjusting highway costs. Therefore, a simplifying approach was taken where highway distance was multiplied by an inflation-adjusted cost per mile for out-of-pocket auto operating costs and the resulting cost difference applied using the cost coefficient in the pivot model. A similar adjustment, in the opposite direction, was applied for the forecasts based on the differential fuel inflation rates assumed in the transit operating cost model.

One additional shortcoming in the modeling approach was caused by the limitations of the MWCOG modeling area which excludes upper Montgomery County and lower Prince George's County as well as the outer counties where some exurban commuters reside. Data from the Metrorail survey included trip making by these commuters. This information was used as a surcharge to the modeling results.
MCI.-WDPK MOTFIE

The results of the analysis using this technique were extremely poor, particularly for non-home based rail trips. The technique applies a ratio of approximately $20 \%$ to the work mode split. Even in the core area with a high mode split, this would result in only a 10 - 15\% mode split for non-home based transit trips. More importantly, in the core area very few non-home based trips are made by private automobile, thus the derived trip market is very small. In reality, of course, many non-home based rail trips in the core are made for business purposes where the modal trade-off is between Metrorail and taxi or Metrorail and long walks rather than between transit and private automobile; the factoring "model" is unable to address this condition.

Therefore, an alternative approach was taken, based upon the rail survey. Non-home based trips using rail stations in the core area and other major activity centers such as Bethesda, Silver Spring, and the Medical Center where most activity is within easy walking distance of Metrorail were extracted from the survey. Trips on the remaining interchanges were calculated using the factoring model. Projections of the growth in the activity center trips were made based upon employment trends at both ends.

With the opening of the Green line, other areas such as the Waterfront and Navy Yard will probably begin to exhibit a similar non-home based rail travel pattern. Therefore, additional rail trips were added for these areas. The number and distribution of trips from these areas were based on patterns for similar areas with existing rail service.

The results of this procedure were still low for both home-based and non-home based rail trips when compared with the survey. An examination of the results showed that that home-based trips were being estimated reasonably well in the District but were significantly underestimated in the suburbs, with the greatest underestimation for Montgomery and Fairfax counties. In all likelihood, this result can be traced back to the structure of the model, which contains relationships based on 1968 bus ridership. With the advent of Metrorail, home-based non-work travel for shopping and other activities, particularly for travel to the core area, becomes viable. However, since auto ownership levels are high in the suburbs, the implied mode split is only 17 - 18\% of the work mode split. Coupled with the relatively small size of this market, the result is very few transit trips.

No fully satisfactory adjustment process similar to the discrete non-home based adjustments appeared viable. Therefore, a simple adjustment factor was applied to the modeled non-work trips. The factor varied by jurisdiction with 1.5 being applied in Arlington, Alexandria, and Prince Georges County, 2.5 in Fairfax County, and 3.0 in Montgomery County. The factors were assumed to remain constant in future years and were applied to a larger travel market as rail service was extended into more suburban areas.

Rail revenue estimates are summarized in Exhibit IV.10.
Passenger revenue was obtained as noted above and converted to an annual value using a nominal annualization factor of 280 . The result, as expected, slightly exceeds the budgeted values and future year values were adjusted simply as the ratio between the 1985 model and survey totals. School subsidy re-imbursement, primarily by the District, was not assumed to change from current levels because of the stability of population.

The fare reimbursement reflects the District's policy of providing a 10 cent discount for peak rail boardings at stations east of the Anacostia River. The policy was assumed to continue and to be extended to Anacostia and Congress Heights (Alabama Avenue) stations as the Green Line is extended. The amount of the allocation was taken from the model estimates of boardings at the affected stations. The results were not expected to be overly precise because of the relatively large districts used in the analysis and access splits between adjacent stations which are not subject to the discount. The model underestimation was simply scaled by the ratio of the 1985 results.

The max fare reimbursement is a WMATA policy to partially offset the impact of the "taper and cap" on rail fares. The reimbursement is estimated from a comparsion of revenues from the tariff and those that would be collected from the same number of passengers under a straight distance-based fare. Currently, one-half of the difference is then allocated in proportion to the jurisdiction of the benefiting passengers while the other half is absorbed in the system values. As shown, the model estimate is slightly low for the reimbursement and the values were adjusted on a jurisdictional basis.

Parking revenues were estimated using a simple index of potential revenue obtained by multiplying the number of spaces by the allday parking cost. Large, newly-opened parking lots were discounted since volumes build somewhat slowly. This approach was used to compute a scaling factor which was compared to the budgeted revenues for 1985; a value of approximately $86 \%$ was obtained by this method. The scaling factor was increased slightly, to 90\%, for the 1993 and 2000 analysis, reflecting WMATA plans to extend the hours during which parking fees are collected. The revised scaling factor was multiplied by the potential revenue index to obtain the values shown in the Exhibit.

Estimates for non-fare revenues were provided by WMATA. Investment income and advertising revenues are projected to grow as the system expands. Leverage leasing income terminates in 1987 with the expiration of the tax law. Joint development income shows a substantial increase between 1985 and 1993 as current projects mature. This estimate does not include income from additional rents or future development agreements, which results in a lack of change between 1993 and 2000.

EXHIBIL IV.10<br>AETRORAIL REVENUES

ichal
0 Of:

Bus revenue is much more complicated since it is computed in an allocated manner based upon the dedication codes of the buses involved and whether or not a rail transfer is used. An initial calculation of bus revenues using the technique of multiplying projected trips by tariff fares produced a high estimate of 1985 revenue. The result occurs in part because the total Metrobus ridership estimate is somewhat high as well as the lower degree control over fare collection and other factors noted above.

Bus revenues derived from the tariff are expected to be high because this procedure assumes that full fare is both paid and collected on all bus trips. The revenue yield is lower due to passes and discounts, fare evasion, passenger confusion, and other factors leading to a less than $100 \%$ revenue collection. The effects of these factors were quantified from the Spring 1984 Bus Passenger Survey and other data provided by WMATA. Separate factors were developed on a jurisdictional basis to reflect Flash Pass usage and uncollected revenues.

Checks on the modeling approach show that estimates of bus-only and bus-rail trips are higher than the limited data available. Factors were developed for each of the markets and used to reproduce the base year results. These factors were then applied to the future year estimates. Even though some of the factors were somewhat larger than desirable, the results were considered to be acceptable since only minor changes in bus ridership and revenue were projected. The resulting projections are summarized in Exhibit IV.11.

Finally, rail patronage by jurisdiction of residence is required as an input to the Metrorail operating support formula and was computed from the model results. The model results reproduced the 1985 rail survey and 1986 budget distributions quite closely and the minor adjustments required were assumed to continue into the future. The resulting factors are noted in the allocation section of this report below.

## V. OPERATING COST PROJECTIONS

## INTRODUCTION

This chapter documents the transit operating cost models developed and applied by Peat Marwick to project Metrobus, Metrorail, and local bus costs. The cost models consist of LOTUS 1-2-3 microcomputer spreadsheets that, together with projected estimates of transit service to be provided in future years, are used to project future transit operating expenses. The cost models are based on recent operating budget data supplemented by operating experience and discussions with key WMATA and local government transportation management staff.

The three major operating cost models are:

- Metrobus cost model, which projects the costs to operate and maintain diesel buses including local, express, and feeder routes to Metrorail;
- Metrorail cost model, which projects the costs to operate and maintain vehicles, stations, track and structures, and ancillary facilities and systems for Metrorail. These costs are distinct and separate from the rehabilitation and replacement costs documented in Chapter VII.
- Local bus cost models, which project the costs to operate the four suburban bus operations:
- Montgomery County "Ride-On"
- Fairfax County "Fairfax connector"
- City of Alexandria "DASH"
- Fairfax City "CUE"

The cost models are structured in such a way that once annual operating statistics have been determined, the annual costs can be computed quickly. The primary inputs to the Metrobus, Metrorail, and local bus models include those factors traditionally developed in the urban transportation planning process: peak vehicles, annual vehicle hours, and annual vehicle miles. In addition, the Metrorail model requires descriptors of the physical characteristics of the system including stations, route miles, and yards.

The cost models are intended to be used in evaluating alternative regional bus and rail service levels and construction schedules. The models project costs in both base year (1986) and inflated dollars. It must be emphasized that these models are approximations and although they are derived from the most recent operating budgets, they simplify the detailed procedures used to develop annual transit system budgets. To the extent possible, the models reflect the latest available financial, operational, and maintenance data.

Wha remainder of thas chapter diswasses the fillwang.

## BASIC COST MODEI STRUCTURE

 composed of a serjes of equations that project casersac a function of the quantity of transportztion serion fravided. . . .

 ínur moulel Variabole w'a:

```
o Mnj<m l A!c.- **;
```

Union labor costa

 tramy pasaernompos wae it

- Labor Productivity Factor: The number of non-supervisory personnel, or personnel-hours, required to adequately staff each unit of service provided. This factor considers the impact of worker efficiency, need for training, and scheduled and unscheduled absenteeism.
- Cost per Unit: The wage per hour (or per year) for the non-supervisory employees providing the basic service. This is usually the wage for vehicle operators and mechanics and includes average wages (straight wages plus overtime, vacation, and sick pay). It does not include expenses for fringe benefits (such as pension funds, FICA, and insurance).

These data were obtained through a detailed review of operating budgets, supported by discussion and interpretation by knowledgeable staff. All costs are in FY86 dollars.

## Front-Line Supervisory Non-Union Labor Costs

Front-line supervisory non-union labor cost equations are of the form:

| Front-line |
| :--- |
| Supervisory |
| Labor Cost |$=$| Number of |
| :---: |
| Union |
| Employees |$\times \quad$| Union Employees |
| :---: |
| Front-line |
| Supervisor |$\times \frac{\text { Avg. Supervisor }}{\text { Salary }}$

where the factors are defined as follows:

- Number of Union Employees: The number of a particular category of union employee to be supervised (e.g., the number of bus mechanics, cleaners, or janitors).
- Union Employees/Front-line Supervisor: The number of union employees a foreman or supervisor can manage.
- Average Supervisor Salary/Man-Year: Annual salary for front-line supervisor, not including fringes.

Administrative Non-Union Labor Costs
These costs are based on either current (fixed) number of employees in various administrative staff areas or on an exogenously determined number of employees that may change over time. Average salary per employee was determined from operating budgets. Projected number of employees was obtained from knowledgeable staff.

## Parts, Supplies, and Service Costs

The variable parts, supplies, and service cost equations project costs for maintenance parts, fuel, office supplies, and similar non-personnel costs. The equations are generally of the form:

```
Parts, SI:5.Sa=
        ard/or
grar')ar# (%at
whryr: +ha :%.*
```

Bus Drivin; *a: \& a : ...
! : ,
$\cdots$

Kail Drivin; Yriat ? ....

- Revenue Train Hours: Annual scheduled hours of service (including revenue, layover, and deadheading; not including start-up, training, utility; extra service, special events, and fringe benefits (sick, holiday, vacation, funeral));
- Subway Stations: Stations located in cut-and-cover, earth tunnel, or rock tunnel;
- other Stations: Stations located at-grade, in cut, in retained cut, or on aerial structure;
- Mezzanines: Station entrances with a station agent and fare collection equipment;
- Service and Inspection (S\&I) Yards: Major maintenance facilities where all maintenance activities can take place and where large numbers of vehicles can be stored;
- Route Miles: Length of two-way track in revenue service (between terminals of lines, not including yard, pocket, and other non-revenue track) ;
- Manned Interlockings: Switching points located at terminals, points of route divergence, and yards where an operator is assigned;
- Terminals: Number of ends of lines;
- Rail Passengers: Annual rail passenger boardings.

## INFLATION CONSIDERATIONS

All of the unit costs in the operating cost models are expressed in 1986 constant dollars. These costs were derived from 1986 budget data and other sources, converted to 1986 dollars using historical rates of Consumer Price Index (CPI) inflation.

Inflation rates were assumed for the following components:

- "Base Line" Inflation: The rate of increase in the Washington, D.C. CPI applied to all labor costs (wages, salaries, and fringe benefits) and non-personnel costs other than diesel fuel, parts, and electricity.
- Diesel Fuel Inflation: Inflation based on the historical and projected incremental difference between the base line inflation rate and diesel fuel price increases.
- Electricity Inflation: Based on anticipated incremental difference between the base line inflation rate and PEPCO and Virginia Power rates for WMATA.
- Parts Inflation: Based on historical and anticipated incremental difference between the base line inflation rate and prices for vehicle and systems maintenance parts.

Projected inflation rates were based on short-term budget assumptions by WMATA and longer-term assumptions approved by the TAC:

| Year | Base Line | Diesel Fuel | Eletricity | Parts |
| :---: | :---: | :---: | :---: | :---: |
| FY86 | - | - | - | - |
| FY87 | 3.5\% | 2.0\% | 4.9\% | 4.9\% |
| FY88 | 5.0 | 5.0 | 5.0 | 5.0 |
| EX89 | 5.0 | 5.0 | 5.0 | 5.0 |
| FX90 |  |  |  |  |
| thru | 5.0 | 7.0 | 7.0 | 6.0 |
| FYOO |  |  |  |  |

The inflation rates used in the operating cost analysis use the Washington CPI projection as the "base line" rate of inflation. The incremental differences between the base line rate and the rate for specific cost components is then applied to compute compounded inflation factors for specific cost components.

The inflation factors computed in this manner were used to Q.stamate costs in inflated dollars. The "uninflated" or "base year" costs reflect the incremental inflation only, but do not directly include the base line CPI values. A detailed description of the inflation calculations is included in Appendix $D$.

## ANALYSIS OF PRIOR WMATA OPERATING COST EXPERIENCE

In preparing to calibrate the Metrowus and Metrorail cost models, it was recognized that WMAIA's prior operating cost experience would have to be examined in order to determine the extent to which costs have stabilized. This was important because the basis of the calibration was the FY86 proposed operating budget. This analysis of prior years' cost was also undertaken to address concern regarding the degree to which "fixed" costs have truly horn stable over time.

The analysis was performed based on data obtained from WMATA's Ofilce of Budget and Management Analysis in the form of computer printouts of actual costs incurred in fiscal years FX81 through FY85. FY86 budgeted costs were included as well as a basis for :omparison. The WMATA data recorded actual expenses and encumbrances by office, by mode (bus and rail), and by line item.

The analysis was structured according to the WMATA organizational structure assumed for the FY86 budget. There have been significant changes in the WMATA organizational structure over the past six years and costs for prior years were entered in the analysis according to the new structure. As a result, the totals by department (and occasionally by office) are not always the same as data from other sources.

Another important consideration, particularly in reviewing the magnitude of fixed costs, is that it was not always possible to accurately separate fixed from variable costs for a number of reasons:

- Aggregation of Fringe Benefits: All fringe benefits, except in FY81, are shown in a single category "NonDepartmental Expenses". As a result, all fringes are shown in a category separate from "fixed" and "variable" expenses.
- Aggregation of Salaries: All salaries are aggregated in each office. It was not possible to separate salaries for front-line supervisors. These expenses are legitimately "variable" in nature as they vary with the level of service provided. As a result, there is a trend in the analysis for Metrorail's fixed expenses to increase over time as the level of service increases and the salaries for front-line supervisors increase.

The results of the analysis of the operating cost data are shown graphically and discussed in detail in Appendix D. The major conclusions may be summarized as follows:

- Bus fixed costs, in base year dollars, have remained relatively constant over the past three years.
- Total bus operating costs, in base year dollars, have also remained relatively constant and, indeed, have actually declined somewhat, which reflects a slight decrease in the level of service provided.
- Rail costs have significantly increased with the growth of the Metrorail system.
- Metrobus costs per vehicle mile increased in real terms through FY84 and have stabilized since, due in part to aggressive cost containment actions.
- Metrorail costs per car-mile also increased through FY84 and have declined since, again reflecting aggressive cost containment actions by WMATA.
- Metrorail staffing requirements have shown general improvement in productivity since FY84.

## CALIBRATION OF METROBUS AND METRORAIL COST MODELS

The Metrobus and Metrorail operating cost models were calibrated based on the WMATA FY86 Approved Budget. The calibration process involved structuring a series of equations, such as those outlined earlier in this chapter, to replicate the budget. The actual equations are summarized in Appendix D.

## Adjustments to FY86 Calibration

The following areas were identified in which modifications to the FY86 cost relationships had to be made to reflect FY87 costs. Greater detail in each area is included in Appendix D.

## Termination of old Programs and Initiation of New Programs

WMATA i sspending roughly $\$ 10$ million on programs that are phasing out and will not recur in FY87. Some of these programs, such as the Flxible bus rehabilitation program, were previously addressed in the model. There are approximately $\$ 4.3$ million in various new programs and enhancements to existing programs that were not reflected in the FY86 budget. These are summarized in Appendix. D.

## Changes in Labor Productivity and Unit costs

Various program areas will be affected by changing experience and external factors. These areas include:

- workers compensation
- third party liability claims
- insurance
- facilities maintenance
- rail car maintenance
- rail systems maintenance
- electricity

In many of these areas, such as workers compensation, facilities maintenance, and electricity, WMATA anticipates continued improvement in productivity. In other areas, such as third party liability claims and insurance, WMATA experience will likely mirror that of other transit systems with significant increases in costs. Rail systems maintenance will generally improve with more efficient use of manpower but extended hours of operation on Sundays will offset these improvements. Although rail car maintenance productivity has improved over the past several years, it seemed prudent to maintain current levels of productivity through FY90 and then gradually show a reduction in productivity as the rail fleet ages.

Detailed results in each cost area are summarized in Appendix D.

## APPLICATION OF WMATA METROBUS AND METRORAIL COST MODELS

Exhibit V.l summarizes the driving variables, inflation rates, and labor productivity factor inputs to the Metrobus and Metrorail operating cost models for fiscal years 1986, 1993, and 2000. Exhibit V. 2 summarizes the model outputs for these years, including an allocation of fixed and variable costs and a breakdown of salaried and union employees.

The cost models were applied to project costs for every year from FY86 through FY00. A detailed set of projections for each

## LOCAL BUS OPERATING COST PROJECTIONS

Annual operating costs were projected for the four local jurisdictions that operate bus systems. Cost models were calibrated in a manner similar to that used for the Metrobus and Metrorail cost models. Projections were made for the years 1986, 1993, and 2000.

The sources of information for these projections were discussions with knowledgeable staff supplemented by detailed budgets and consultant reports. The following summarizes the level of service assumptions and resulting cost projections:

- Montgomery County: Currently, service is provided with 151 peak-hour buses. Ten buses are assumed to be added by 1993 and 10 more by 2000. Vehicle-miles and vehiclehours are assumed to expand on the basis of fleet size. Operating costs increase from $\$ 6.7$ million to $\$ 7.6$ million from 1986 to 2000 (in 1986 dollars).
- Fairfax County: The current Huntington feeder service utilizes 27 peak-hour buses and is assumed to continue unchanged for the base line projections. Operating costs remain constant at $\$ 1.0$ million (1986 dollars).
- City of Alexandria: The current service utilizes 15 peak-hour buses. Three buses are assumed to be added for Cameron Valley service by 1993. Vehicle-miles and vehicle-hours are assumed to expand on the basis of fleet size. Annual operating costs increase from $\$ 0.6$ million to $\$ 0.7$ million (1986 dollars).
- Fairfax City: Re-orientation of Fairfax City service to serve Metrorail is assumed to be accomplished within the current overall budget of $\$ 0.5$ million.

\end{gathered}
$$

$\qquad$

[^1]
## WMATA OPERATING EXPENSES

## VI. RAIL CONSTRUCTION

The rail construction necessary to complete the planned 103 -mile Metrorail system is broken down into two major groups: those segments that are a part of the $89.5-\mathrm{mile}$ system to be funded on the basis of the Stark-Harris Federal authorization and those segments that comprise the final 14 miles of the system. The Stark-Harris segments are the following:

| Line | Terminal | Scheduled Opening |
| :--- | :--- | :--- |
| Orange | Vienna |  |
| Red | Wheaton | June, 1986 |
| Green | UStreet | March, 1989 |
| Green | Anacostia | July, 1990 |
| Yellow | Van Dorn | December, 1990 |
| Green | Greenbelt ${ }^{1}$ | December, 1990 |
|  | December, 1992 |  |

1 Shuttle operation from Ft. Totten
The following segments complete the 103-mile system:

| Line | Terminal | Scheduled Opening |
| :--- | :--- | :--- |
| Red |  |  |
| Gellow | Flenmont | January, 1994 |
| Green | Columbia Hts, | January, 1994 |
| Green | Georgia Ave. 2 | July, 1994 |
| Green | Branch Avenue | December, 1997 |

2 Connection between Columbia Heights and Ft. Totten
The capital costs for completing the Metrorail system are somewhat difficult to set forth because of the differences between the obligation of funds for segments, when construction is actually performed, when funds are received from Federal and local sources, and other accounting issues. For simplicity, costs were developed based upon the schedule of billings to the local jurisdictions. These billings reflect the construction schedule agreed upon by local officials (ICCA-IV) and assume an uninterrupted flow of Federal funds.

For the Stark-Harris (89.5-mile) system, the Federal government is assumed to pay for $80 \%$ of the construction costs, although some delays have occurred in recent Federal obligations. For system completion, two alternative funding scenarios were developed. Under the scenario most favorable to the local and state governments, Alternative A, the Federal government is assumed to pay 75\% of the post Stark-Harris construction costs, which is in line with current UMTA capital grant matching ratios. Under the scenario less favorable to the local and state governments, Alternative B, no Federal funds are assumed available beyond the Stark-Harris authorization.

## RAIL CONSTRUCTION CAPITAL REQUIREMENTS

(Millions, 1986 Dollars)

| Fiscal | Total | Federal | Share ${ }^{\text {a }}$ | Internally ${ }^{\text {b }}$ | Non-Fed | 1 Share |

## VII. REHABILITATION AND REPLACEMENT COST PROJECTIONS

This chapter presents the methodology and results of an analysis of the capital requirements for the rehabilitation and replacement of Metrobus anmd Metrorail facilities and equipment. These projections represent costs that are over and above projections of operating and construction costs.

Rehabilitation and replacement ( $R$ \& R) activities are a natural extension of routine maintenance activities currently being undertaken by WMATA. Rehabilitation and replacement of facilities and equipment occurs for the following reasons:

- Functional obsolescence: due to a part or component wearing out
- Technological obsolescence: due to a new device becoming available that meets or exceeds the requirements of the current device
- Changed requirements: due to changes in policy, such as level of service or safety

In these cases, the decision to rehabilitate or replace usually entails comparing the costs to repair (generally considered an operating cost) versus the cost to rehabilitate or replace. This analysis would directly address anticipated functional and technological obsolescence. Rehabilitation and replacement costs due to changed requirements would be addressed in so far as current policy has affected original design requirements.

## METHODOLOGY

The following categories were used to structure the analysis:

- Metrobus facilities and equipment
- facilities and equipment, except buses and new maintenance facilities
- buses
- new maintenance facilities
- Metrorail facilities
- facilities, except track
- track
- Metrorail equipment
- equipment, except rail cars
- rail cars

The projection of future costs for facilities and equipment except for buses, new bus maintenance facilities, track, and rail cars was structured to take advantage of the following information available from WMATA:
a

 $\square$

$$
\begin{array}{cc}
: \quad: ~ & t \\
\ddots & \vdots \\
\vdots & \vdots
\end{array}
$$

110
$1 \quad 1$
1.1
and the differing cycle lengths of the rehabilitation and replacement cycles. For example, the large costs shown for 1987 and 1997 represent the 10 - and 20 -year $R \& R$ cycles for Metrorail assets capitalized in 1977. These assets include a significant portion of the Metrorail system: from Rhode Island Avenue to Dupont Circle and from Stadium-Armory to National Airport.

Given that the projected sudden increases and decreases in the magnitude of the capital rehabilitation and replacement program would be difficult to plan for and administer, the realities of the budgeting process in all likelihood would lead to a smoothing out of the stream of expenses. In recognition of this eventuality, the projected costs were averaged using a 7 -year "rolling average", which involves averaging three years on either side of the target year. Another advantage of using the rolling average is it addresses some costs that would be incurred just beyond the year 2000.

## INPUT ASSET VALUES

The input data for all asset categories except buses and rail cars was provided in tabular form by the WMATA Office of Management Information Services (MISV) which displayed the dollar value of all Authority assets. Separate tables were prepared for Metrobus, Metrorail facilities, and Metrorail equipment. The tables aggregated costs into approximately 50 asset classes, tabulated by year of expenditure. In the case of Metrorail facilities and equipment, assets were capitalized in the year the segment (or "phase") opened (or will open) for revenue service.

These tables were reviewed for accuracy and completeness by comparing other routinely generated fixed asset accounting reports. There were several instances of assets not coded by year of capitalization. These were examined on a case-by-case basis and were manually assigned to the appropriate year.

These data were then converted from year-of-expenditure to base year (1986) dollars using historical inflation rates documented by PROG.

## METROBUS FACILITIES AND EQUIPMENT REHABILITATION AND REPLACEMENT COSTS

Three separate analyses were undertaken to compute Metrobus facilities and equipment $R \& R$ costs:

- facilities and equipment, except buses and new maintenance facilities
- buses
- new maintenance facilities

$u *+1 y \leq 1=4$
$\frac{1}{1}-\frac{-1 \mid}{1}=y^{n}=$

RAIL STRUCTURE REHAB \& REPLACEMENT

This latter wear on curved track generally controls its useful life, being more severe than the wear on the top surface of the rail. For economic reasons, WMATA employs a technique, common in the railroad industry, of transposing the inner and outer rails in curve sections. Thus, a given piece of track can have its useful life roughly doubled over that which would be dictated by wear on the inner surface of the outer rail.

At the first replacement cycle, the rails are simply transposed and no track is replaced. At the second cycle, the now-worn outer rail is replaced. At the third and succeeding cycles, the outer rail is moved to the inside, a new outer rail is installed, and the inner rail is discarded.

For purposes of this analysis, WMATA classified the existing trackage into three categories based on type of construction and traffic loads:

```
o Subsurface, heavy traffic (SSH)
O Subsurface, routine traffic (SSR)
o Surface (including aerial) (SUR)
```

In addition, all track was categorized by degree of curvature into four groups:

- Curve 1: under 900 foot radius
- Curve 2: 900-1200 foot radius
- Curve 3: 1200-2000 foot radius
- Tangent (including curves over 2000 foot radius)

WMATA supplied a summary of the percentages of track by type for each phase of the existing system and each planned extension. These data are summarized in Appendix E.

WMATA staff estimated the useful lives for each classification, including the transposition interval for curve sections. They also estimated a difficulty factor for various replacement activities which was applied to the labor and equipment costs used in the replacement activities but not for the materials. Finally, WMATA staff estimated the reclaimed value of materials, the value of materials retained in place, and the ratio of materials cost to labor and equipment costs for the construction contracts. For new construction, an additional factor was applied to back-out the cost for third-rail which is included in the trackwork contract but has an extremely long life.

The life expectancies and difficuly factors for the various sections are as follows:

| Type | Curvature | Useful Transpose | Life Replace | Difficulty <br> Transpose | Factor <br> Replace |
| :---: | :---: | :---: | :---: | :---: | :---: |
| SSH | Tangent | - | 18 | - | 3.0 |
|  | Curve 1 | 3 | 6 | 2.0 | 2.5 |
|  | Curve 2 | 5 | 10 | 2.0 | 2.5 |
|  | Curve 3 | 8 | 16 | 2.0 | 2.5 |
| SSR | Tangent | - | 25 | - | 3.0 |
|  | Curve 1 | 5 | 5 | 2.0 | 2.5 |
|  | Curve 2 | 8 | 15 | 2.0 | 2.5 |
|  | Curve 3 | 11 | 21 | 2.0 | 2.5 |
| SUR | Tangent | - | 35 | - | 2.0 |
|  | Curve 1 | 10 | 20 | 2.0 | 2.0 |
|  | Curve 2 | 20 | 35 | 2.0 | 2.0 |
|  | Curve 3 | 20 | 35 | 2.0 | 2.0 |

In addition, the following factors were assumed to be applied as appropriate:

- Materials assumed as $45 \%$ of total construction cost; labor and equipment comprise the balance
- Third rail assumed as $29 \%$ of construction estimate for new segments
- Reclaim value of materials assumed as $20 \%$
- For SUR sections, $35 \%$ of the value would be retained in place and reduce both materials cost and labor and equipment cost; this reflects retention of some ties, fasteners, ballast, etc. which are also routinely replaced as part of maintenance activities
- For transposition, labor and equipment cost assumed as 15\%

Applying these various factors resulted in the following replacement cost percentages:

| Type | Curvature | First <br> Cycle | Second <br> Cycle | Other <br> Cycles |
| :--- | :--- | :---: | :---: | :---: |
| SSH \& SSR | Tangent | - | - | $201.0 \%$ |
|  | All Curves | $30.0 \%$ | $86.8 \%$ | $220.8 \%$ |
| SUR | Tangent | - | - | $94.9 \%$ |
|  | All Curves | $30.0 \%$ | $47.5 \%$ | $62.5 \%$ |

The results of the analysis for all segments and estimated costs through 2015 are shown in Appendix E. All values were calculated on an annual basis and converted to a seven-year rolling average for display purposes. The resulting average values for 1986 2000 are shown in Exhibit VII.5. No tangent track replacement is

## TRACK REHAB AND REPLACEMENT

shown until 1992 but thereafter costs rise quickly to \$8 - \$10 million per year through the late 1990's. Replacement costs for curved track reflect an ongoing program that increases from \$4\$5 million per year in the mid 1980's to approximately $\$ 10$ million by 2000. The total costs for the key years of 1993 and 2000 are $\$ 15.0$ million and $\$ 14.5$ million, respectively.

It should be noted that the track replacement costs reflect only mainline track in revenue service. Yard track is currently replaced less frequently, except at major wear points, and track removed from elsewhere in the system is generally re-used in the yards, often after turning it around using the loop tracks. The labor costs and minor material costs for these activities are currently included in the maintenance budget.

## METRORAIL EQUIPMENT REHABILITATION AND REPLACEMENT COSTS

Two separate analyses were undertaken to compute Metrorail equipment $R \& R$ costs:

```
- Metrorail equipment, except rail cars
O rail cars
```

## Metrorail Equipment, except Rail Cars

The assets were categorized into the following major classes:

- escalators and elevators
- communications
- Automatic Train Control (ATC)
- Automatic Fare Collection (AFC)
- wayside and power
- other, including office furniture and equipment, service vehicles, shop equipment, and data processing equipment

The detailed classes are shown in Exhibit VII.6. Current and projected asset values, along with the replacement cycle assumptions, are shown in Appendix E. The sources of the cycle assumptions were ENGA and RAIL. The results of the analysis are shown on an annual basis in Exhibit VII.7.

## Rail Car Rehabilitation and Replacement Costs

WMATA currently does not have very much information regarding the rehabilitation and replacement of the rail car fleet. Experience from other properties is of limited value because of the unique features of the WMATA vehicles. Based on limited information, WMATA estimates a useful life for the rail cars of approximately 35 years, recognizing that the actual life for individual vehicles will vary somewhat from that average. With a current replacement cost of approximately $\$ 1.1$ million in 1986 dollars, this represents a very significant cost. However, this cost would not be reflected in the analysis unless it is annualized, since the useful lives of the initial fleet would not be reached until approximately 2012.

## EXHIBIT VII. 8

WMATA RAIL CAR REHABILITATION COSTS BY COMPONENT

| Component | \% of Total cost | \% of Cost Replaced |  | Freq. Years | Total \% |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Car Body | 7.84 | 40 |  | 1b/20 | 3.136 |
| Dest. Signs/Lighting | 2.45 | 100 | 12 | \& 24 | 4.900 |
| Propulsion System | 4.28 | 15 |  | 20 | 4.280 |
| Friction Brakes \& Pneumatics | 13.01 | 15 |  | 20 | 1.952 |
| Auxiliary Systems | 4.33 | 33.3 |  | 20 | 1.443 |
| Truck/Suspension \& Primary Power System | 34.02 | 10 |  | 20 | 3.402 |
| Coupler/Draft Gear | 1.70 | 40 |  | 15/20 | 0.680 |
| Doors \& Controls | 3.82 | 100- |  | 15/20 | 3.820 |
| HVAC | 4.22 | 40 |  | 15/20 | 1.688 |
| Communications | 0.97 | 100 |  | 15/20 | 0.970 |
| ATC System | 23.36 | 25 |  | 15/20 | 5.840 |
| TOTAL | 100.00 |  |  |  | 32.111 |

In addition to the ultimate replacement of the vehicles, a major rehabilitation is anticipated at approximately half-way through the life of the car or at about 18 years. WMATA estimates that the value of the car components that would be replaced would amount to $32.11 \%$ of the total car value when car-borne ATC equipment is included, or about $\$ 353,000$ per car. Exhibit VII. 8 summarizes the derivation of this replacement factor, on a component-by-component basis.

Some of these components have already been replaced on the initial WMATA fleet of Rohr cars through various upgrade programs. For purposes of the analysis, this has been assumed to delay the mid-point for rehabilitation to 23 years for these vehicles.

Because of the magnitude of rail car costs and the fact that the replacement costs and most of the rehabilitation costs would not be incurred until after 2000, it was deemed prudent to treat rail car costs somewhat differently from those for the rehabilitation and replacement of other rail and bus system components. Therefore, simple straight-line, average annual costs were computed for the rehabilitation and replacement of each component of the current and future Metrorail fleet. These calculations were made by estimating the rehabilitation and replacement dates for each fleet component, then spreading these costs uniformly over the respective useful lives. For the current fleet, the costs were computed over a shorter time frame reflecting the age of the fleet and were assumed to start in 1988 since no provision for these costs is currently included in the 1986 or 1987 WMATA budgets.

Thus, the rehabilitation year for the initial 240 Rohr cars that were capitalized in 1977 would be 2000 with replacment in 2012. The remaining 60 Rohr cars follow one year later. The first Breda cars, capitalized in 1983, would require rehabilitation in 2001 (18 years) but replacement would not occur until 2018. The remaining Breda cars in the current fleet would be rehabilitated and replaced on an annual basis over succeeding years. The final cars purchased are scheduled to begin revenue service in 1997, resulting in rehabilitation in 2015 and replacement in 2032.

For each fleet, the rehabilitation and replacement costs were spread over the appropriate years and summed for annual values. The resulting values are shown in Exhibit VII.9. The rehabilitation costs increase from approximately $\$ 16$ million to approximately $\$ 19$ million by the end of the century. The replacement costs increase from approximately $\$ 25$ million to approximately $\$ 30$ million over the period. The totals for 1993 and 2000 are $\$ 42.2$ million and $\$ 48.9$ million, respectively. A more complete analysis of each fleet component on an annual basis through 2015 is shown in Appendix E.

## RAIL CAR REHAB AND REPLACEMENT

## SUMMARY

A summary of all rehabilitation and replacement costs is shown in Exhibit VII. 10 for buses, other bus costs, rail structures, track, rail equipment, and the annualized rail car values. Costs increase from approximately $\$ 100$ million in the late 1980's to almost $\$ 160$ million by the end of the century. The values for the key years of 1993 and 2000 are summarized in Exhibit VII.11.

## LIMITATIONS

This analysis is the first comprehensive analysis of WMATA's capital rehabilitation and replacement costs. Indeed, transit systems rarely have attempted this type of projection. While WMATA has prepared a Five-Year Metrobus and Metrorail Reliability Program, this program was not intended to address costs beyond the 5-year planning horizon. For this reason, the Five-Year Program was of limited assistance in this analysis.

Although it appears possible to model future WMATA capital rehabilitation and replacement costs on experience of other transit systems, the fundamental differences between WMATA and other properties preclude this comparison. These differences include:

- Technology: Metrorail is extremely sophisticated in many areas. Some of the systems used are unique to WMATA. Most systems are more advanced than those of the older, Northeastern rail systems. With the exception of BART, no new rail transit system has more experience than WMATA.
- History of Deferred Maintenance: WMATA has one of the best maintenance programs in the transit industry. Many transit systems are currently investing large sums of money to compensate for years of deferred maintenance.

For these reasons, the study relied on the professional judgment of knowledgeable WMATA staff for estimates of the length of rehabilitation and replacement cycles and the relative costs of replacement.

Clearly, the level of detail in the projection of Metrorail systems equipment (AFC, ATC, traction power, and communications) far exceeds the detail in the facilities cost projections. Ideally, WMATA should begin to conduct such component-bycomponent assessments in other maintenance areas in order to further refine these projections.

It is also recognized that the magnitude of these rehabilitation and replacement costs suggests a significant increase in the size of the WMATA staff to plan and manage the work. Such an increase in administrative costs is not addressed in the operating cost projections.

## VIII. ALLOCATION OF WMATA SUPPORT

## OPERATING SUPPORT

The allocation of Metrorail operating support is based on a formula that gives equal weight to rail system supply, ridership by jurisdiction of residence, and population density. Rail system supply is defined as the number of stations in a given jurisdiction. Population density allocations have been based upon the 1980 census and this study uses the 1980 census allocations as well.

The third component -- ridership by jurisdiction of residence of passengers -- is briefly discussed in Chapter IV. Passengers from outside the WMATA compact are ignored in computing the allocation percentages, although their numbers are substantial, particularly for non-home based trips. The model results, by jurisdiction of residence, were adjusted slightly to match observed data. All of the allocation factors are summarized in Appendix $F$.

Metrorail operating assistance is computed simply as the difference between total Metrorail operating costs and total Metrorail revenues. Exhibits VIII. 1 and VIII. 2 show Metrorail operating assistance allocated by jurisdiction according to the criteria described above. This allocation is presented in constant 1986 dollars. The total WMATA rail assistance is projected to nearly double between 1986 and 2000. The jurisdictional allocation of the Metrorail support varies, with Prince George's County and Fairfax County experiencing a greater percentage increase since rail service within these jurisdictions increases dramatically. The other jurisdictions experience lesser percentage increases as their shares computed by the formula decrease.

In addition to the operating assistance noted above, the jurisdictions provide Metrorail fare support through two additional programs. The District of Columbia's discount for trips using stations east of the Anacostia River is assumed to expand with the Green Line extension to the Anacostia and Congress Heights stations. Also, the maximum fare reimbursement to WMATA for trips benefiting from the rail "taper and cap" is distributed on the basis of the jurisdiction of benefiting passengers. Both factors are shown in Exhibit VIII.1.

Metrobus operating assistance is computed by allocating costs and revenues separately by jurisdiction. The allocation of Metrobus revenues were derived from the patronage analysis described in Chapter IV. Metrobus costs are allocated on the basis of busmiles and bus-hours of service within a given jurisdiction. These are then applied to allocate the fixed, miles-related and hoursrelated Metrobus operating costs.

EXHIBIT VIII. 2
METRORAIL OPERATING ASSISTANCE

Exhibit VIII. 3 shows allocated Metrobus costs and revenues. The operating assistance by jurisdiction is simply the difference between costs and revenues. The level of assistance is not expected to change dramatically in future years. Although bus service will be turned-back or eliminated as the rail system expands, many of the routes deleted in the central city are generally more productive than the system-wide average. In addition, some modest increases are projected in new Metrobus services in the outer counties.

The total WMATA operating support by jurisdiction is shown in Exhibits VIII. 4 and VIII.5. These jurisdictional costs represent the sum of Metrorail operating support, Metrorail fare reimbursement, and Metrobus operating support. As the previous exhibits illustrate, most of the increase reflects expansion of Metrorail service.

Metrorail, Metrobus, and total WMATA operating support are summarized in Exhibits VIII. 6 and VIII.7. These Exhibits includes an estimate of the revenues and costs for other Metrobus programs which, following previous WMATA assumptions, are assumed to be self-supporting. These programs include contract and charter service, net investment income, leverage leasing (soon to expire), and bus advertising and miscellaneous income.

The cost recovery ratios decline slightly for both Metrorail and Metrobus. However, since Metrorail, with its higher recovery ratio, becomes a much larger part of overall WMATA services, the overall recovery ratio for the system actually increases slightly.

## ANNUAL ESTIMATES

Annual operating cost estimates were prepared by running the operating cost model described in Chapter $V$ with a set of annual operating statistics as input. The rail statistics were computed based on the schedule of openings of the Metrorail system and reflect partial years of operation as appropriate.

Metrobus operating statistics were also estimated on an annual basis tied to rail openings. The changes described in Chapter 3 were applied for each corridor and were assumed to take place with the implementation of the rail service changes. For simplicity, no other modifications to Metrobus services at other times were reflected in the analysis.

Bus and rail passenger revenue and rail support program estimates were computed on an annual basis by interpolation between the 1985, 1993, and 2000 values. The interpolation factors included a demographic trend based on increases in core area employment, the single most significant determinant of transit ridership. The interpolations also included the relative ridership changes in various corridors to reflect the different Metrorail extensions during the 1986 - 1993 and 1993-2000 periods.

COVERAGE OF WMATA COSTS

Annual parking revenue was computed based on the scheduled opening of parking facilities with some lag to account for maturing of ridership patterns. Other revenues such as joint development, interest earnings, advertising, and bus charter and contract services were projected based on assumptions provided by WMATA.

The annual cost and revenue estimates were then used to compute operating support requirements which were, in turn, allocated to the jurisdictions using the formulas described above. The resulting allocations are summarized in Appendix G.

## DEBT SERVICE

Another requirement of WMATA support is the debt payments on the original WMATA revenue bonds. These payments are normally treated as an operating expense by the local jurisdictions. The annual of payments required of the six major jurisdictions are as follows:

- \$10.085 million - District
- 4.434 million - Montgomery County
- 4.439 million - Prince Georges County
- 3.093 million - Fairfax County
- 2.675 million - Arlington County
- 1.384 million - Alexandria
- \$26.110 million - Six Major Jurisdictions

Since these payments are fixed, they will decline in constant dollars to $\$ 18.825$ million by 1993 and $\$ 13.378$ million by 2000 .

## REHABILITATION AND REPLACEMENT COSTS

Other WMATA capital costs have traditionally been allocated using formulas similar to those described above for operating costs. These formulas have been assumed to apply to the rehabilitation and replacement ( $R \& R$ ) costs described in Chapter VII.

The allocation of rail $R \& R$ costs is based on an average of the allocation of rail operating support over the past five years. Historical data obtained from WMATA were used together with the annual estimates of operating support derived as noted above.

Bus capital costs are allocated simply on the basis of the mileage-related term used in the assignment of operating costs to jurisdiction. This approach was used for all bus $R$ \& $R$ costs and is consistent with past WMATA practices.

FEDERAL SUPPORT
Federal support to WMATA traditionally has been provided in several areas: rail construction support, most recently under the terms of the Stark-Harris authorizations; various other capital grants for bus and rail equipment and facilities; and operating
support. With respect to continued Federal support of rail construction, two scenarios are set forth in Chapter VI.

The concept of two alternative Federal funding scenarios is also appropriate for other forms of Federal aid. Federal operating assistance currently is allocated for the six major jurisdictions as follows:

| $\circ$ | $\$ 7.805$ million - District |
| :--- | ---: |
| $\circ$ | 2.958 million - Montgomery County |
| $\circ$ | 2.958 million - Prince Georges County |
| $\circ$ | 2.407 million - Fairfax County |
| $\circ$ | 1.527 million - Arlington County |
| $\circ$ | 0.727 million - Alexandria |
|  | $\$ 18.382$ million - Six Major Jurisdictions |

Under the favorable funding scenario (Alternative A), Federal operating assistance is assumed to remain level in year-ofexpenditure dollars, thus declining in constant dollars. The Federal operating support in constant dollars therefore drops to $\$ 13.253$ million by 1993 and to $\$ 9.419$ million by 2000 . Under the unfavorable Federal funding scenario (Alternative B), operating assistance is assumed to be discontinued entirely, in line with the current administration proposal.

Federal support for rehabilitation and replacement costs under the favorable funding scenario is assumed to be at a level of $75 \%$ of total requirements. This assumption implies a modification of Federal policies regarding major rail rehabilitation and replacement. Currently, discretionary Federal funds for these purposes are limited (at a $75 \%$ match) to systems that were not constructed with major Federal participation.

Under the unfavorable Federal funding scenario, the only Federal funds available are assumed to be those contained in the proposed block grant program. The Washington area's allocation under this program would remain constant in year-of-expenditure dollars and would equal approximately $\$ 21.6$ million in 1993 and $\$ 15.4$ million in 2000. For analysis purposes, these funds were assumed to be allocated proportionally to bus and rail $R \& R \cdot r e q u i r e m e n t s ~ i n$ any given year.

## STATE SUPPORT

Support provided by the states of Maryland and Virginia has become significant to the local governments in the Washington area. The two programs have very different institutional histories and allocation approaches. Of course, no equivalent source of state aid exists for the District of Columbia.

The Maryland aid is provided through the Maryland transportation trust fund and is assumed to be available in the future at currently applied matching ratios. Under the Maryland aid program, the State pays $100 \%$ of Metrorail construction costs
allocated to Montgomery and Prince George's counties. The State pays $75 \%$ of incidental capital costs, which are assumed to include all of the projected rehabilitation and capital costs, and $75 \%$ of the revenue bond debt service. For operating support, the State pays $75 \%$ of the local allocation after accounting for Federal aid and subject to an overall farebox recovery ratio of $50 \%$ or higher.

Virginia state aid consists of direct appropriations and revenue from a state authorized gasoline tax. This revenue stream is assumed to increase in line with the overall rate of inflation, thus remaining constant in 1986 dollars at a level of \$31.602 million. Moreover, Virginia state aid is assumed to be used as it has been in recent years.

The Virginia aid is first assumed to be applied to completely fund the debt service on the original Metrorail revenue bonds. The remaining funds are assumed to be allocated between operating support and capital in the same proportions as in recent years, or about $85 \%$ for operations and $15 \%$ for capital.

The allocation to jurisdictions within Virginia is based $75 \%$ on total WMATA operating support and $25 \%$ on total transit operating costs. For Alexandria and Fairfax County, the latter includes the costs of operating the DASH and Fairfax Connector bus systems. The resulting percentage allocations for the three key years are as follows:

1986
Fairfax
Arlington Alexandria Other
$52.45 \%$
$28.28 \%$
16.80\%
$2.48 \%$

1993
52. $46 \%$
28.48\%
16.98\%
$2.07 \%$

2000
53. $27 \%$
28.13\%
16.56\%
$2.04 \%$

The capital allocations are assumed to be applied to Metrorail construction until that program winds down in the late 1990's and are applied to rehabilitation and replacement costs thereafter.

## SUMMARY OF ALLOCATIONS

A summary of allocated WMATA support by category for the region is shown in Exhibit VIII. 8 for the two Federal funding scenarios. Under the favorable Federal funding, the total assistance remains at approximately $\$ 300$ million per year throughout the projection period. Under the unfavorable scenario, total support increases to just over $\$ 600$ million during the early $1990^{\prime}$ s, dropping back to about $\$ 400$ million after completion of Metrorail construction.

An overall allocation of WMATA support by jurisdiction is shown in Exhibit VIII.9. Individual summaries for the six major jurisdictions are shown in Exhibits VIII.10 - VIII.15. In the latter exhibits, state aid is shown as well, except for the District of Columbia. All data used in preparing these exhibits and other relevant information are summarized in Appendix G.

## IX. MEASURING THE WMATA BURDEN: $1980-1985$

Between 1980 and 1985, Washington area governments experienced an 88 percent increase in their transit assistance allocations for WMATA transit services from \$118.1 million in 1980 to $\$ 221.6$ million in 1985 (both figures in year-of-expenditure dollars). This increase resulted from a 53 percent increase in bus assistance (from $\$ 89.1$ million to $\$ 136.5$ million), a 103 percent increase in rail assistance (from $\$ 29.0$ million to $\$ 58.9$ million), and the allocation of debt service on bonds issued to finance rail construction (see Exhibit IX.1). It should be noted that the costs did not increase uniformly over this period. The largest annual increase (23 percent) occurred in 1981 when debt service payments were first included. The smallest annual increases ( 4.4 percent and 5.1 percent) occurred in 1984 and 1985, and reflected the effect of lower inflation rates and cost cutting measures.

It has been suggested that this rapid growth in transit assistance has placed undue strains on the ability of area governments to pay these costs while meeting their other responsiblities. While undue strain does not lend itself to exact definition, it is possible to compare the operating assistance allocations of the jurisdictions to some simple measures of ability to pay. These measures indicate how large the burden is, as well as whether it is an increasing relative burden.

The relative burden may be viewed against four different measures. These measures compare transit assistance allocations to:

- Personal Income, which is a good measure of the underlying wealth that is generated in the area, and that is thus available to pay taxes. Personal income is measured at place of residence and includes not only earnings but also unearned income such as interest and rents. (Personal income information is not yet available for 1984 and 1985.)
- Earnings, which are measured by place of employment. This measure reflects the extent of jobs and business activity that exists within the jurisdictions in the area. While earnings are not directly taxed by any jurisdiction, they do represent a stream of economic activity within a jurisdiction, and thus enhance the economic base. (Earnings information is not yet available for 1984 and 1985.)
- Property Value, which is a tax base common to all area jurisdictions and the one that is used to generate substantial revenues. This measure shows the transit assistance allocation as a tax rate that would need to be applied to property values.

Five-Year
Increase

Sources: Operating Assistance Report, Fiscal Year 1985, WMATA, Appendix $C$, and special tabulation from WMATA, dated August 13, 1985.

- Total Operating Expenditures for each government. This measure relates the transit assistance allocations directly to government budgets, and thus shows how much of a government's actual resources need to be used for this purpose. This measure does not lend itself to comparisons between jurisdictions because there is a wide variance among governments in the services they provide, and, therefore, in the size of their total expenditures. For example, the District's expenditures are relatively large because they include expenditures that are made by state governments in suburban jurisdictions.

These measures can be applied against either the gross transit assistance allocations, or the net transit assistance allocations, i.e., after deducting Federal and state operating assistance. The gross allocations are important because they show how the formulas allocate the burden by jurisdiction, and because they represent the maximum potential burden that each jurisdiction might have to incur.

The net basis, after reducing the allocations by avaılable Federal aid and state transit assistance payments, results in an actual measure of the financial burden incurred. When only the net assistance allocations are considered, the local area government payments increased only 67 percent from $\$ 82.7$ million in 1980 to $\$ 138.5$ million in 1985 (see Exhibit IX.2). While Federal aid declined over the period, state aid increased more than sixfold. In 1985, as in previous years, total state aid was somewhat higher in Maryland than in VIrginia, with, of course, no state aid in the District.

What do the measures show about the ablity of area governments to bear the costs of WMATA in recent years? A summary of the measures are shown in Exhibit IX. 3 for gross assistance and in Exhibit IX. 4 for net assistance after state and Federal aid is taken into account. More detailed data showing the actual cost elements of the measures are included in Appendix I. The sources of data in all these Exhibits were:

- WMATA operating assistance: Operating Assistance Report, Fiscal Year 1985, WMATA, Appendix C, and special tabulation from WMATA, dated August 13, 1985.
- Personal Income: Local Area Personal Income, Vol. 3 Mideast Region, 1978-83, U.S. Department of Commerce, Bureau of Economic Analysis, June 1985.
- Property Values and Total Expenditures: Annual financial reports and official statements of jurisdictions.

As shown in these Exhibits, the results are mixed, but generally they show the increased burden has not been as heavy as the dollar or percentage increases in transit assistance allocations would suggest.

.395 . 446 . 335 . 369

In the gross allocations, there has generally been a year-to-year increase in the burden for all four measures. However, when measured against property values the burden decreased after 1983 for the District, Arlington, Alexandria, and Prince George's County. As a percent of overall operating expenditures, the burden also declined from 1983 to 1985 for the District, Arlington, and Alexandria.

There is a wide variance between some jurisdictions for some indicators. For example, the District allocation in 1983 would require almost 1 percent of the total income compared with only 0.2 percent in Montgomery County, but the difference may merely reflect the much greater District of Columbia service received.

An important measure from a political viewpoint is the relatively low and stable property tax levy required for the gross operating assistance allocations. In the District, this measure actually declines from . 497 in 1980 to .420 in 1985. The largest growth in this measure from 1980 to 1985 was only . 030 from . 142 to . 172 in Prince George's County.

While the gross allocations grew as a percent of total expenditures in all jurisdictions, and reached a high of 8.4 percent in Arlington County in 1984, it is probably more important to look at this measure on a net basis after applying Federal and state aid. When this is done two governments, Montgomery County and Prince George's County, have only slightly more than 1 percent of their total expenditures allocated for WMATA operations. Arlington's high 8.4 percent on a gross basis in 1984 drops to 3.4 percent in 1985 on a net basis. The District of Columbia, because it receives no state assistance, reflected the largest increase in net assistance payments as a percentage of expenditures, from 2.5 percent in 1980 to 3.5 percent in 1985, although this percentage was declining in both 1984 and 1985.

The allocations on a net basis, in addition to being lower by all measures than the gross allocations, show slower growth over the period especially after 1981. For example, in 1983 all four measures were lower in Montgomery County, Fairfax County, and Arlington County than they were in 1981, as a result of the rapid growth in state assistance payments in these years.

In summary, the measures of burden using either gross or net operating assistance allocations show varying degrees of burden between jurisdictions. There has been some growth in relative burden, although not consistently when Federal and state assistance is taken into account. These results are only historical and are not predictive of future years, but they do show that area governments have absorbed large increases in WMATA transit assistance payments in recent years with small, if any, changes in relative burden.

## X. CHANGE IN SIX AREA GOVERNMENTS REVENUES AND EXPENDITURES 1986-2000

Projecting the six major area governments' revenues and expenditures for fifteen years on both a current and constant dollar basis results in an immense quantity of numbers that defy easy understanding. Therefore, it is necessary to reduce results to a relatively few numbers that best illustrate what is likely to occur to these governments' finances over the 1986-2000 period.

To do this, the change in total revenues and expenditures in constant dollars only (i.e., after discounting inflation) is used for each government separately and for all governments combined. Tax rates are assumed to remain constant and expenditures are projected at current service levels. To provide an understanding of what is causing the changes, the amount of revenue expected from local sources is shown separately from intergovernmental aid. Similarly, key elements of government spending, such as general payrolls (including retirement and fringe benefits), school expenditures, and debt service, are discussed individually.

The relationship between each individual government's revenues and expenditures is not shown on either a current or constant dollar basis. As a practical matter, all governments will operate with generally balanced budgets over the period, and it would not be realistic to present a picture that would show otherwise. While there are differences that the governments will need to address, their decisions on how to do so will be political and it would not be appropriate to make such estimates in these projections.

The constant dollar changes in revenues will be reviewed first, followed by a discussion of expenditures.

## Revenues

Preliminary projections estimate that the total revenue of the six major governments will increase 19.8 percent ( $\$ 1.1$ billion in constant 1986 dollars), from 1986 to 2000 (see Exhibit X.1). The principal factors used in the projections to translate economic growth rates into increases in sales, income, and personal property tax revenues are the changes in employment, which COG projects to increase 30.4 percent, and changes in population, which COG expects to increase 11.0 percent. Based on historical trends, property taxes are expected to have real growth from new construction averaging about 2.5 percent per year, except for D.C. residential, which is experiencing little growth from new construction. The result is total area real growth in property taxes of 46.4 percent, with a range from 18.0 percent in the District to 69.0 percent in Fairfax County.

The expected favorable performance of the local economy results in real growth of 33.0 percent or $\$ 1.4$ billion in locally raised

* Does not include WMATA Federal or state aid
revenues, but the overall growth in revenue is greatly reduced because intergovernmental revenue from the state and Federal governments is expected to decline by $\$ 241$ million or 15.3 percent in 1986 dollars. Several factors account for this decline. They include the elimination of the Federal revenue sharing program after 1986 and the expectation that, because of Federal budget restraints, other Federal aid will only increase at three-quarters of the inflation rate. State aid is also expected to grow slowly because it is dominated by aid for schools. School enrollments are expected to be stable or declining in future years, except in Montgomery and Fairfax counties. This results in a slow real growth in school aid.

The projected revenue growth varies among governments in proportion to each jurisdiction's expected real growth in employment and population, and to each government's sensitivity to changes in intergovernmental aid. Because the District is projected to have the slowest rate of real growth in its employment and population, it has the lowest rate of real growth in its local revenues and it is also hardest hit by the projected decline in Federal aid, which in 1986 constituted over a third of its revenue. As a result, the District's total revenue growth of $\$ 196$ million or 7.1 percent in constant dollars from 1986 to 2000 is less than half the 15.1 percent growth in the second lowest growth jurisdiction, Prince George's County.

In sharp contrast, Fairfax County revenue is expected to increase $\$ 452$ million or $46.6 \%$ in 1986 dollars. This results from a rapid growth in employment, population, and new construction. Fairfax County is also the only government expected to have a real growth in intergovernmental aid over the period. This results from the county being affected only slightly by the decline in Federal aid (which accounts for only 3.4 percent of total county revenues), and an increase in state school aid as a result of some growth in school enrollments.

Montgomery County also is expected to have a rapid growth in local revenue, but it also has the largest percentage reduction in intergovernmental aid because of a projected $\$ 17$ million loss of state school aid in 1986 dollars between 1986 and 2000. This results from an anticipated state policy that will result in less school aid in real dollars on a per pupil basis. However, because intergovernmental aid is a relatively unimportant source of County revenues ( 11.6 percent in 1986), the County's total revenue growth is still expected to be second only to Fairfax County with a 34.3 percent real growth.

It is important to realize, of course, that the projected revenue growth shown in these tables depends on a variety of assumptions. The key ones are expected growth in population, employment, and new construction; estimated changes in Federal aid policies and state aid policies; and estimated changes in school enrollments.
growth, and, therefore, their school spending will grow more rapidly. The District expects only a very minor year-to-year growth in enrollments. Because of the high percentage of suburban government spending for schools, and because school spending is closely tied to changes in enrollments, the differences in assumptions about school enrollments have a major effect on these governments' year 2000 spending levels.

Debt service is not a substantial part of most governments total spending, and it is projected to grow by only 3.5 percent in constant dollars for all governments combined, despite an assumption of 8.5 percent interest costs on new debt for all governments, except the District, for which 9.0 percent is assumed. The District's higher rate assumption results from its lower bond rating and its use of level debt service repayments rather than equal principal payments.

There is a very wide variance between a 35.4 percent increase in Fairfax County's debt service, and Arlington County's 47.6 percent decrease. This difference occurs for several reasons. Arlington County, Alexandria, and Prince George's County are projecting relatively low levels of capital spending in future years. In the case of Arlington and Alexandria, this reflects the fully developed nature of the jurisdictions, and the belief that capital needs will be low. Montgomery County's decline in real debt service payments results from a projected leveling off of a recent large capital spending program. In contrast, Fairfax county's growth reflects an expected rapid expansion in capital spending, in part because of highway spending needs. The District's growth reflects the city's continued effort to catch up on its capital needs, and the effects of issuing debt on a level debt service basis'.

The overall results of the financial projections seem reasonable based on the assumptions about the area's future growth, and based on recent trends. It should be emphasized, however, that the projections of each individual government's finances also depend on assumptions about where in the area future growth will occur, and on a continuation of current government policies regarding services and taxes.

## BASIS FOR LOCAL GOVERNMENT FINANCIAL PROJECTIONS

Revenue and expenditure projections for the six major Washington area governments were prepared using a projection method developed by the Greater Washington Research center. The approved 1986 Budgets for each jurisdiction provided the base information for projecting operating revenues and expenditures, property values, and bonded debt. The base information actually used was reviewed and approved by each jurisdiction. The projection logics for each major revenue and expenditure component were developed from historical trend information and from discussions with officials in each government. In most instances, the basis for the projections was similar to that used by the government for its own planning purposes.

The projection logics first increased most revenues and expenditures by the assumed inflation rate. There were some exceptions, such as Federal general revenue sharing, which was assumed to be discontinued after 1986, and general Federal aid, which was increased at only three-fourths the inflation rate because of Federal deficit problems.

The projection logics next adjusted for real growth or decline in revenues and expenditures. For income, sales, and personal property taxes this was done by using the combined projected changes in population and employment. Real estate property taxes were increased by a factor representing the historical percentage growth from new construction combined with local views on the outlook for development. State school aid changes are related to changes in school enrollments. Other taxes were increased to reflect population growth.

For real changes in expenditures, pay related expenditures were changed in relation to population change for general employees, and to school enrollments for school employees, plus a factor for both called "creep". Creep adjusts for merit increases and other non-general pay raises. This creep factor was obtained from the actual experience reported by the governments. The population change factor was doubled for Fairfax and Arlington counties because of the reported effects on county employment being caused by rapid urbanization. Other general expenditures were changed in relation to projected population changes, and other school expenditures were related to projected school enrollments.

Debt service was determined by adding to existing debt service requirements the debt service needed for new issues planned by the governments in their approved capital improvement plans. For bond sales beyond the capital improvement plan, an annual growth in bond sales equal to inflation was assumed. For all suburban governments, 20-year bonds with equal principal payments and 8.5 percent interest rates were used. For the District of Columbia, 20-year bonds with level debt service payments and 9 percent interest rates were used. The revenue and expenditure projections do not include WMATA operating revenues from state and Federal aid or WMATA assistance programs.

The projected revenue and expenditures for each year were converted to 1986 constant dollars by reducing the current dollar projections using the assumed inflation rate as a deflator. The results in constant dollars for all six governments combined showed that total revenue growth and total expenditure growth were within 1 percent of each other over the projection period. This indicates that the revenue and expenditure projections have a reasonable budgetary relationship to each other. The projections of real growth in total government revenue and expenditures of just under 20 percent for the fifteen years also is reasonable in view of real economic growth of 1 percent to 2 percent per year in the region, and in the context of relatively conservative taxing and spending policies being followed by the governments.

At the individual government level, the variations in real growth in revenues and expenditures was much greater than at the regional level, both in terms of the divergence in growth between revenue and expenditures for governments and in the differences in growth rates between governments. However, such diversity seems reasonable in view of the differences in economic growth that are occurring across the region, and the related differences in the spending demands that are facing the governments. What could not be projected, because it will require political decisions, is the extent to which the individual governments will use either changes in tax rates or changes in expenditure growth rates to bring revenues and expenditures into alignment. Since the purpose of the projections is to show natural growth in revenues with no changes in tax rates, and expenditures required to maintain current service levels, it is not necessary to project actual future budget actions affecting tax rates or service levels.

The projections assume no year-to-year variations in growth rates as a result of variations in the national and local economies caused by recessions and expansions. To do so would have required assumptions about when such critical events will occur, and it was deemed impractical to make such assumptions. The immediate implications of not doing so is that projections probably understate the revenue growth that will be included in the area government's 1987 Budgets as a result of the current very strong Washington area economy. However, over the fifteen-year projection period, this current, better than projected growth is certain to be offset by some slow growth periods. In fact, the effects of Federal budget reductions may make even 1987 a less strong revenue growth year than was initially expected by the governments.

Past experience, both nationally and locally, in projecting local government revenues and expenditures has shown that things seldom work out exactly as projected. This is so because some economic assumptions do not materialize, some unexpected events occur, and some political actions intervene. The projections made in this study face all these hazards, but because they were prepared in close consultataion with area officials who are closely familiar with their governments' outlook, they present a reasonable view of the future.
XI. THE EFFECTS OF FUTURE WMATA FINANCING ON AREA GOVERNMENTS

The local governments in the Washington area contribute to the support of the WMATA bus and rail systems through payments for:

- bus and rail operating support
- rail fare support
- debt service on the original WMATA revenue bonds
- bus and rail rehabilitation and replacement costs
- rail construction

In the past, the local governments have received significant financial assistance from the Federal government. However, future Federal assistance is in doubt and the analysis has been structured to reflect two alternative Federal support scenarios:

- Favorable Federal aid scenario (Alternative A):
o continued operating support, although at a diminished level in constant dollars.
- Federal assistance for rehabilitation and replacement equal to $75 \%$ of costs.
- Federal rail construction assistance equal to $80 \%$ of the costs authorized by the stark-Harris legislation and $75 \%$ of the costs to complete the final 14 miles of the 103 -mile system.
- Unfavorable Federal aid scenario (Alternative B):
- an end to Federal operating assistance.
- Federal assistance for rehabilitation and replacement limited to the Washington region's entitlement under a proposed formula-based block grant.
- rail construction assistance equal to $80 \%$ of the costs authorized by the Stark-Harris legislation but no Federal support for remainder of 103-mile system.

In addition, the states of Maryland and Virginia contribute significantly to WMATA support. .Support in Maryland flows from a state trust fund which has been assumed to be adequate to cover all requirements in accordance with current policies and matching ratios. Support in Virginia is from state appropriations and a local gasoline tax and has been assumed to remain fixed in constant dollars.

The burden on local jurisdictions is unequal across the region since the District receives no state aid and the impact of the state formulas, particularly under unfavorable Federal funding conditions, varies significantly in Maryland and Virginia.

The impact of WMATA support on local governments can be examined either in absolute dollar terms or relative to the projected operating budgets and total tax bases of the local jurisdictions. These latter two measures were discussed in Chapters IX and X and were selected for their reasonableness and because the data were available based on projections done for the local jurisdictions.

Operating assistance payments to WMATA frequently are compared to overall local government financial resources since these payments are made annually and generally funded as line-items in the local governments' operating budgets. An allocation of total operating assistance payments for three key years is shown in Exhibit XI.1.

On a regional basis, operating assistance is projected to increase slightly in relation to total operating expenditures (from 3.78\% to 3.84\%), but to decline slightly in relation to property values. The regional pattern is mirrored in the experience of Arlington and Alexandria. In the District, operating assistance payments increase in relation to both property values and operating expenditures. In Prince George's County, operating assistance remains level relative to property values but increases in relation to operating expenditures. In rapidly growing Montgomery and Fairfax counties, operating assistance declines in relation to both operating expenditures and property values.

The impact of the net operating support burden (after accounting for Federal and state aid) is shown in Exhibit XI.2. This Exhibit also shows the effect of the two alternative Federal funding scenarios in future years.

On a regional basis, the percentage of operating expenditures devoted to operating assistance increases from 2.38\% to $2.56 \%$ under the favorable Federal scenario and to $2.66 \%$ under the unfavorable alternative. The impact of Maryland's state assistance programs is clearly shown with the Maryland counties showing far lower values than the other jurisdictions. The impact of the Federal cutbacks under Alternative $B$ is also less in Maryland since state aid is assumed to make up much of the shortfall while Virginia state aid is assumed to be a constant value under either Federal funding scenario.

Debt service on the original WMATA revenue bonds is also generally shown as an operating expense by the local governments. The payments are assumed to continue to be funded fully by state aid in Virginia and $75 \%$ from state aid in Maryland. Since these payments remain level in year-of-expenditure dollars, they will declinein constant dollars, dropping to nearly half their 1986 value by 2000. Also, since total financial resources of the local governments will be increasing over this period, the burden of debt service will be further reduced. Overall, the total local burden (without consideration of state aid) will decrease from about $0.47 \%$ of operating expenditures to about $0.20 \%$ and from 0.020\% to $0.008 \%$ as compared to property values.

Alternative A (Favorable Federal Policy; continuation of Federal transit operating assistance)

Alternative B (Unfavorable Federal Policy; no Federal transit operating assistance)

The costs for rehabilitating and ultimately replacing components of the bus and rail systems will become significant in the future although the magnitude of these costs will be greatly influenced by Federal funding policies. The figures shown in Exhibit XI. 3 are payments to WMATA for operating support, debt service, and the local share of rehabilitation and replacement costs. State aid has been taken into account in the calculations, as has Federal aid under the two Federal funding scenarios.

On a regional basis under the favorable Federal funding scenario, total support increases slightly in relation to total regional expenditures from 1986 to 1993 then increases again very modestly by the end of the century. Under the unfavorable Federal funding scenario, however, total support increases dramatically due to increasing rehabilatation and replacement costs.

Federal aid is much less important to the Maryland jurisdictions since state aid is assumed to cover $75 \%$ of rehabilitation and replacement costs, irrespective of how large these costs may be. The impact of Federal aid is more severe in Virginia where, for example, the 1993 ratio for operating expenditures for Arlingtor. is $60 \%$ higher under the unfavorable Federal scenario than under the favorable alternative. Arlington and Alexandria also show the greatest relative impact on long-term funding for the year 2000 .

It should be noted that Exhibit XI. 3 does not include the local share of rail construction capital costs. These costs are excluded because it is difficult to assess how they will be paid; some jurisdictions may pay their respective shares out of current revenues while others may elect to sell bonds. Suffice it to say that Exhibit XI. 3 gives an incomplete picture of the total magnitude of WMATA costs owing to the exclusion of these rail construction costs.

The annual values used to compute these exhibits are summarized in Appendix H. Other data used in the analysis is discussed in Chapter VIII and included in Appendix G.

## APPENDIX A

## PROPOSED METROBUS CHANGES BY ROUTE

## NEAR-TERM CHANGES - VIENNA CORRIDOR

- 1: Wilson Boulevard-Fairfax services. Routes 1A, 1H, 1M, 1W, and 1X, outlying Fairfax express services to Ballston and the Pentagon, would be discontinued. Routes 1C, 1E, and $1 F$ would operate similar to current service via Wilson Blvd. with increase in frequencies. Routes 1V and $1 Z$ would also operate via Wilson Blvd. but without stops between McKinley and Ballston. Route 1B would serve the Dunn Loring station and the new Fairview Park development with service in the counterflow direction.
- 2: Washington Boulevard-Vienna services. Routes 2E, 2F, 2 M , and 2 V , outlying express services to Ballston and the Pentagon, would be discontinued. Route 2A would be modified to run between Dunn Loring station and Ballston with additional service. Route $2 B$ would operate from Fair Oaks to Ballston via Vienna and East Falls Church stations. Route 2 C would be modified slightly to serve Metrorail stations and with increased service. Routes 2W and 2 X would be modified to operate between Vienna and the Vienna station. Route 2 P would be added to operate between Vienna and Dunn Loring.
- 3: Lee Highway services. Routes $3 C$ and $3 E$ services to Roslyn would be discontinued. Route 3 B and 3 F would be modified to serve the East Falls Church and West Falls Church stations with increased peak service. Routes 3X and 3Z, express services to Ballston, would be changed to terminate at West Falls Church with some other routing changes in the Tysons Corner area. Route 3A would be added from Annandale to Rosslyn via Annandale Road and East Falls Church station.
- 4: Pershing Drive/Arlington Boulevard services. Minor changes in routing to provide replacement service on Wilson Boulevard from Barton Street to Rosslyn.
- 5A-H: Reston services. All routes would operate to West Falls Church Metrorail station. Many relatively minor service changes within Reston. Route $3 F$ would be extended to Franklin Farms. "Straggler" service would be added at the end of the morning and evening rush periods.
- 5K,L,M: Chain Bridge Road services. Relatively minor routing changes in Tysons Corner and McLean areas; direct services to Rosslyn and Farragut Square via George Washington Parkway maintained.
- 5S: Herndon service. Route changed to terminate at West Falls Church rather than Ballston; minor re-routing in Tysons Corner area.
- 5Y: Herndon express. Route changed to terminate at West Falls Church rather than Ballston.
- 5Z: Tysons Corner express. Discontinued.
- 10: cross-county service. Minor changes in north Arlington.
- 12C: Centerville service. New route from Centerville to Vienna station via I-66.
- 22: Walker Chapel-Shirlington services. Extension of route 22 B to East Falls Church station via Williamsburg Blvd. and Sycamore St. Elimination of Culmore branch of route 22 C .
- 23: Glebe Road services. Relatively minor changes in Tysons Corner area and service to the CIA.
- 23X: Great Falls express. Route changed to terminate at West Falls Church rather than Ballston.
- 24: Seven Corners-Pentagon service. Routes 24A and 24B from Tysons Corner and East Falls Church to the Pentagon will be replaced by other services. Route 24 E will be extended from East Falls Church to Seven Corners. Route 24 T would operate from from McLean Hamlet to East Falls Church station.
- 26: Tysons Corner-Springfield service. Rerouted in Tysons Corner area and to serve Dunn Loring station. Additional peak period service will be provided.
- 28: Alexandria-Tysons Corner service. Rerouted to serve West Falls Church station.
- 292: Chantilly express. Extended to Chantilly and changed to Vienna station instead of Ballston and the Pentagon.
- 38B: Route 38C branch will be eliminated and 38B service will be increased.
- 66X: West Falls Church express. Discontinued.

## STARR-HARRIS SYSTEM CHANGES - BRANCH AVENUE CORRIDOR

- A2,4,6,8: Martin Luther King Drive services. All services to terminate at Anacostia station.
- V3,7: Anacostia expresses. Combined with A routes and terminated at Anacostia station.
- Al0: New route from Anacostia station to Federal Triangle.
- V5: Fairfax Village express. Terminated at Anacostia station.
- W7: New route from Naval Research Laboratory to Anacostia station; replaces routes P5, P9 and W3.
- 92,94,B2,B4: Crosstown routes. Revised to serve Anacostia station in statistics shown here; actually proposed to be broken into multiple routes at Anacostia station.
- V1,9: Anacostia expresses. Combined with crosstown routes above and terminated at Anacostia station.
- C11: Clinton express. Turned back at Anacostia station rather than Federal Center SW.
- P17: Oxon Hill-Ft. Washington service. Turned back at Anacostia station rather than extending to Farragut Square.
- D12,S12: Eastover-Marlow Heights service. Turned back at Anacostia station rather than Federal Center SW.
- W13: Bock Road service. Turned back at Anacostia station rather than Farragut Square.
- w12-17: Indian Head service. Turned back at Anacostia station rather than Federal Center SW.
- New route added to serve proposed development along Potomac River just south of the Beltway. Routed to Anacostia station via I-295 as P17.

## STARR-HARRIS SYSTEM CHANGES - GREENBELT CORRIDOR

- 84,85: Riverdale services. Rerouted to West Hyattsville station rather than to Rhode Island Avenue.
- 89: Laurel express. Rerouted to Greenbelt station rather than Rhode Island Avenue.
- R2: Baltimore Avenue service: Terminated at Prince George's Plaza station instead of Brookland.
- R4: Hyattsville service: Rerouted to West Hyattsville station rather than Brookland.
- R7: Highview service: Terminated at West Hyattsville station rather than Brookland.
- R9: Calverton-Riggs Road service: Some runs rerouted to Prince George's Plaza station rather than Fort Totten.
- R11,15: Greenbelt express service. Rerouted to Greenbelt station rather than to New Carrollton.
- New Laurel services. Assumed at 1.5 times miles and hours of revised Laurel express service (route 89).

## FULL SYSTEM CHANGES - BRANCH AVENUE CORRIDOR

- A2: Congress Heights service. Extend from Southeast Community Hospital to Southern Avenue station.
- A6,A8: Livingston Loop service. Reroute to Congress Heights (Alabama Avenue) station rather than Anacostia.
- A9: South Capitol Street service. Extend to Southern Avenue station via Southern Avenue.
- W2: Washington Overlook loop. Extend to Congress Heights Station.
- W4: Anacostia crosstown service. Reroute via Congress Heights station; no significant impact assumed on operating statistics.
- 32: Shipley Terrace service. Extend to Southern Avenue station.
- 34: Naylor Gardens service. Extend to Naylor Road station.
- 92: Garfield service. Extend to Congress Heights station.
- 94: Stanton Road service. Extend to Southern Avenue station.
- C11: Clinton express. Reroute to Branch Avenue station rather than Anacostia.
- D12,S12: Eastover-Marlow Heights service. West end rerouted from Anacostia station to Southern Avenue station via Southern Avenue. East end extended to Suitland station.
- W11-17: Indian Head Highway services. West end rerouted from Anacostia station to Southern Avenue station. East end of W11-15 extended to Branch Avenue station.
- C12,14: Hillcrest Heights service. Reroute to Suitland station rather than Potomac Avenue station.
- H11-17: Marlow Heights-Temple Hills service. Reroute to Suitland station rather than Potomac Avenue station.
- M11: Suitland Road service. Reroute via Suitland station. Extend south end to Branch Avenue station.

## FULL SYSTEM CHANGES - GREENBELT CORRIDOR

- 42;46: Columbia Road service. Rerouted to Columbia Heights station. No significant impact on statistics assumed.
- H8: Park Road-Brookland crosstown service. Cut back at Columbia Heights station. Mt. Pleasant loop replaced by new route 48 with improved headways.
- K4: New Hampshire Avenue service. Cut back at Georgia Avenue station; some reduction in peak service.
- P2: Petworth service. Cut back at Georgia Avenue station.
- P7: Petworth express. Discontinued.
- S3,S5: 16th Street special services. Reroute to Columbia Heights station.
- 50: 14th Street service. Revise into two routes, one from l4th and Colorado to the Bureau of Engraving and the other from Takoma station to Columbia Heights station.
- 52,54: 14th Street service to Navy Yard. Discontinued.
- 60: 11th Street service. Break into two routes at Georgia Avenue station with different service frequencies.
- 72: Georgia Avenue special service. Cut back at Georgia Avenue station.
- 73: Georgia Avenue service to L'Enfant Plaza. Discontinued.

## APPENDIX B

## PATRONAGE FORECASTING MODEL

As noted in the text, work trip mode splits were computed using a "pivot" model which relates changes in transit share to changes in transit impedances. The pivot formulation can be expressed as follows:

$$
P_{1}=k * P_{0} / 1+(k-.1) * P_{0}
$$

where:

$$
\begin{aligned}
& P_{1}=\text { new transit share } \\
& P_{0}=\text { original transit share } \\
& k=\text { exp (c*v) } \\
& c=\text { logit disutility coefficient } \\
& \mathrm{V}=\text { change in impedance variable }
\end{aligned}
$$

For the MWCOG model, the impedance variables used were transit in-vehicle time, transit out-of-vehicle time, and transit fare. The coefficients used in the model are as follows:

```
0 -0.025: transit in-vehicle time (minutes)
o -0.055: transit out-of-vehicle time (minutes)
0 -0.009: transit fare (1968 cents)
```

Thus, the transit out-of-vehicle time is weighted 2.2 times as heavily as in-vehicle time. For consistency in transit path selection and mode choice modeling, this multiplier of 2.2 was used in the network analysis process to apply to all out-ofvehicle time components.

Calculation of the mode splits to be used in the pivot model required combining of "walk access" and "auto access" impedances obtained from the network analysis. The weighting factors used in the combining process are shown in Exhibit B.l.

In the analysis process, a time/fare tradeoff was required for those users who had multiple transit opportunities. A simple function was developed, as shown in Exhibit B.2, which computed the proportion of users who would select a faster but more expensive rail path as opposed to a slower but less expensive all-bus choice. Some typical impedance tradeoff results are also shown in the Exhibit.

## EXHIBIT B.I

## IMPEDANCE WEIGHTING

Define terms as follows:
$\mathrm{BW}=$ base year impedance variable from "walk access" network
$B A=$ base year impedance variable from "auto access" network
FW = future year impedance variable from "walk access" network
FA = future year impedance variable from "auto access" network
$B W \%$ = base year percent on "walk access" network
$B A \%=1.0-B B \%$
FW\% = future year percent on "auto access" network
$\mathrm{FA} \%=1.0-\mathrm{FB} \%$

Weighted change in impedance:
If $\mathrm{FW} \%$ greater or equal to $\mathrm{BW} \mathrm{\%}$ :
$B W \%$ * $(F W-B W)+F A \% ~ * ~(F A-B A)+(F W \%-B W \%) *(F W-B A)$
If $\mathrm{FW} \%$ less than BW :
FW\% * (FW - BW) + BA\% * (FA - BA) + (BW\% - FW\%) * (FA - BW)

For second phase analysis, the same formulas are used with the following changes in definitions:
$\mathrm{BW}=$ base year impedance from the "best" of the "walk access" and "all-bus" networks
FW = future year impedance from the "best" of the "walk access" and "all-bus" networks

## EXHIBIT B. 2

## TRAVEL TIME/FARE TRADEOFFS

Define terms as follows:

```
ITW = time impedance on the "walk access" path
ITB = time impedance on the "all-bus" path
IFW = fare impedance on the "walk access" path
IFB = fare impedance on the "all-bus" path
IDEL = (ITW - ITB) - (IFW - IFB)
```

Proportion on the walk access path:

```
(ITW - ITB) / IDEL
```

## TYPICAL IMPEDANCE TRADEOFFS

| Bus access path: |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: |
| wait time | 10 | 12 | 10 | 10 | 10 |
| run time | 10 | 10 | 8 | 10 | 12 |
| fare | 120 | 120 | 120 | 90 | 120 |
| All-bus path |  |  |  |  |  |
| wait time | 15 | 10 | 10 | 10 | 10 |
| run time | 80 | 80 | 15 | 15 | 15 |
| fare | 0.800 | 0.910 | 0.750 | 0.800 | 0.850 |
| Impedances | 0.925 | 0.925 | 0.925 | 0.925 | 0.925 |
| ITW | 0.338 | 0.338 | 0.338 | 0.253 | 0.338 |
| ITB | 0.225 | 0.225 | 0.225 | 0.225 | 0.225 |
| IFW |  |  |  |  |  |
| IFB | $52.6 \%$ | $11.8 \%$ | $60.8 \%$ | $81.6 \%$ | $40.0 \%$ |
| Percent bus access |  |  |  |  |  |

The non-work modeling approach developed for MWCOG and used as the base estimate of transit travel utilizes factors which are applied to work mode split estimates. The home based non-work factors differ for households with and without access to an automobile and by trip distance. The non-home based factors differ only by broad distance ranges. The factors used in the model are shown in Exhibit B.3. The impact of car ownership is very pronounced, as the ratio for households with cars is less than a third that for households without cars for all but the shortest trips.

## EXHIBIT B. 3 <br> NON-WORK FACTORS

## APPENDIX C

## PATRONAGE RESULTS BY JURISDICTION AND CORRIDOR

In addition to the regional patronage results shown in the main text of this report and in Exhibit C.1 and C.2, an analysis of a number of market segments is necessary for various purposes. These market segments can best be displayed in "productionattraction" format. In this format, trips are summarized with the home end of the trip recorded as the "production" and the destination end of the trip as the "attraction". Thus, a round trip by a commuter from Arlington to the District would be shown as two trips "produced" in Arlington and two trips "attracted" to the District. Trips from the District to Arlington would, therefore, represent reverse commuting.

One market segmentation that is of importance because of WMATA's funding arrangements is the jurisdictional distribution of travel. A summary of jurisdiction-to-jurisdiction work trips, in "production- attraction" format, is shown in Exhibits C.3, C.4, and C.5 for person trips, transit trips, and work mode split, respectively. The differential growth rates are clearly shown with work trip productions in the District increasing by only 17,000 from 1985 to 2000 while growth in Fairfax and Montgomery counties is over 150,000 for each jurisdiction. Similarly, the effect of differential employment growth can be seen with work trip attractions increasing only about 40,000 each in Arlington and the District, over 100,000 in Montgomery county, and nearly 200,000 in Fairfax County.

Exhibit C. 6 shows an allocation of model results between rail-related and non-rail related trips, by purpose and jurisdiction. The shift between bus and rail as the Metrorail system expands is very evident for the District, while overall growth in suburban jurisdictions tends to mask the shifts in those areas.

Additional detail, focusing on transit trips, is shown in Exhibit C.7, which summarizes transit trips to the District core, the Arlington core, and the rest of the region from major corridors. The corridor boundaries, defined in terms of the districts used in the analysis, are shown in Exhibit C.8. As expected, mode splits are relatively constant for corridors where no transit improvements are included and the transit share increases in corridors with rail extensions. In many cases, however, the resulting trip increases are rather modest, because of the small changes in the size of the various markets.

The network effects that were used to generate the results are selectively summarized in Exhibits C.9 through C.12. These Exhibits summarize the travel times and fares used in the model from each production zone to Farragut Square and L'Enfant Plaza. The times and fares shown are from the free-choice, walk access network described in the text, and thus represent travel characteristics for a commuter who boards a transit vehicle near his home and travels to one of the destinations noted above.

Exhibit C. 9 summarizes weighted travel time changes to Farragut Square. The weighted time is computed as it is used in the model with transit out-of-vehicle time weighted by 2.2 compared to invehicle transit running time. Differences under one minute have been ignored. In a few instances, travel time increases, generally because of a reduction or reorientation of feeder bus service. Travel time improvements are broadly classified into 2 to 10 minutes and over 10 minute ranges. A similar display for travel to L'Enfant Plaza is shown in Exhibit C. 10.

In some instances, the travel time effects are not due to Metrorail changes but to changes made in Metrobus service. For example, increases in travel time from Kensington are due to reductions in Connecticut Avenue bus service and improvements along Colesville Road are largely due to the institution of express service. Similarly, improvements from Lorton reflect extension of the Shirley HOV lanes.

Other changes are due to operational revisions. For example, with the opening of Van Dorn, the Blue Line is extended to Huntington, providing commuters in that corridor better access to Farragut Square but poorer access to L'Enfant Plaza. Some increases in travel time in northeast D.C. and adjacent areas of Prince George's County are due to revisions to bus service with the opening of the Green Line. Also shown on each of the Exhibits is a notation for those zones where neighborhood bus service was assumed to be introduced between 1985 and 2000. No changes are shown since there is no relevant basis for comparison.

Equivalent fare changes are shown in Exhibits C.11 and C.12, excluding changes of 10 cents or less. In most cases, fares increase with extension of Metrorail as the fare for a bus/rail trip will often be higher than for an all-bus trip that is replaced. In a few cases, fares decline, particularly for those people who can walk directly to rail and avoid a bus/rail transfer. The analysis assumed symmetry in rail access and egress with the average of the morning and evening conditions applied. In actual practice, Metrobus access and egress is influenced by the way in which the bus/rail transfer operates.

Two additional analyses were undertaken to determine the relative contribution of network effects, primarily increases in the Metrorail system, and demographic trends in the region. The first analysis was accomplished by multiplying 1985 person trips by the year 2000 mode splits obtained from the modeling process. Exhibit C. 13 illustrates the results of this analysis. As expected, the network effect is most important for rail-related travel, while the demographic effect of regional growth and changing development patterns is more significant overall.

The second analysis was done by multiplying the year 2000 person trips by the 1985 mode splits. These results are summarized in Exhibit C. 14 and show a similar pattern with the network effect being very pronounced, as expected, for the increase in rail trips and decrease in bus trips.

## APPENDIX D

## DETAILED OPERATING COST MODEL ANALYSIS AND RESULTS

This Appendix contains four sets of materials pertaining to the development and results of the operating cost model:

- Cost model structure and results
- Inflation analysis
- Historical WMATA cost data
- Adjustments to FY86 model calibration

Each of these topics is described in the sections which follow.

## COST MODEL STRUCTURE AND RESULTS

Exhibit D. 1 summarizes the results of the WMATA Metrobus and Metrorail operating cost model for the years 1986 through 2000. Page D.l.l shows the bus and rail inputs or "driving variables" for the years 1986 through 1993. The baseline, diesel fuel, electricity, and parts inflation factors are also shown together with the changing productivity of rail car mechanics per vehiclemile. Page D.1.2 summarizes the cost results for the years 1986 through 1993 for Metrobus and Metrorail; the allocation of Metrobus costs between fixed and variable components for the allocation formulas; an approximate breakdown between fixed and variable costs for Metrorail; and estimates of WMATA employees, broken down into salaried and union positions. Pages D.1.3 and D. 1.4 show similar data for the years 1994 through 2000.

Exhibits D. 2 and D. 3 illustrate the detailed workings of the operating cost model as applied for Metrobus and Metrorail operations for the years 1986 and 2000, respectively. In each Exhibit, pages 1-4 summarize bus-related costs and pages 5-8 summarize rail-related costs. Each mode is further broken down into fixed and variable components plus a total.

The costs are summarized into major WMATA organizational units:

- Independent Offices
○ Finance
○ Administration
○ Design, Construction, and Facility Maintenance
- Bus Service
- Rail Service

Each department is further broken down into offices. The final breakdown represents the major components that fall under each office. For fixed labor costs, the number of salaried and union positions are shown, together with the total labor costs. Non-labor costs are shown as a lump-sum. Variable cost relationships include the identification of the relevant driving variable (vehicles, miles, hours, etc.), in addition to the resulting labor and non-labor cost components.

## INFLATION ANALYSIS

The inflation rates used in the operating cost analysis use the Washington CPI projection as the "base line" rate of inflation. The incremental differences between the base line rate and the rate for specific cost components is then applied to compute compounded inflation factors for specific cost components. The general form of the equation for computing the cost factors is:

where:
$\mathrm{CTIF}_{\text {in }}=$ compounded total inflation factor for cost component $n$, in year i
$C P I_{i}=$ inflation rate of consumer price index expressed as a fraction (e.g., 3\% = 0.03), in year i
$I N C R_{i n}=$ incremental ("real") inflation rate for cost component $n$, expressed as a fraction, in year i

The inflation factors computed in this manner were used to estimate costs in inflated dollars. The so-called "uninflated" or "base year" costs reflect the incremental inflation only, but do not directly include the base line CPI values. The inflation factors are computed as follows:

CIIF $_{\text {in }}=\left(1.0+\mathrm{CPI}_{1}+\mathrm{INCR}_{1 n}\right) /\left(1.0+\mathrm{CPI}_{1}\right) \mathrm{x}$
$\left(1.0+\mathrm{CPI}_{2}+\mathrm{INCR}_{2 n}\right) /\left(1.0+\mathrm{CPI}_{2}\right) \mathrm{x} \ldots \mathrm{x}$ $\left(1.0+\mathrm{CPI}_{\mathrm{i}}+\mathrm{INCR}_{\mathrm{in}}\right) /\left(1.0+\mathrm{CPI}_{\mathrm{i}}\right)$
where:
CIIFin $^{=} \begin{gathered}\text { compounded incremental inflation factors for cost } \\ \text { component } n \text {, in year } i\end{gathered}$
Thus:
$\mathrm{CTIF}_{\text {in }}=\left(\mathrm{CIFF}_{\text {in }}\right) \times\left(1.0+\mathrm{CPI}_{\mathrm{i}}\right)$
Note that CIIFin cannot be computed simply as:
CIIF $=\left(1.0+\operatorname{INCR}_{1 n}\right) \times\left(1.0+\operatorname{INCR}_{2 n}\right) \times \ldots \times\left(1.0+\operatorname{INCR}_{i n}\right)$

## HISTORICAL WMATA COST DATA

As described in Chapter $V$, historical data on WMATA operating costs were obtained for fiscal years 1981 through 1985. The following information was used to convert from current year (year of expenditure) dollars to 1986 dollars:
$\left.\begin{array}{ccccc}\text { Year } & \begin{array}{c}\text { Consumer } \\ \text { Price } \\ \text { Index }\end{array} & & \begin{array}{c}\text { Annual } \\ \text { Inflation } \\ \text { Rate }\end{array} & \end{array} \begin{array}{c}\text { Inflation } \\ \text { Factor } \\ \text { (1986 Base) }\end{array}\right)$

The inflation rate assumed by WMATA is 4.00 percent in FY86.
The results of the analysis of the operating cost data are shown graphically in Exhibits D. 4 through D. 12 and are discussed below.

## Allocation of Bus costs

Exhibits D. 4 and D. 5 show the allocation of Metrobus operating costs, in year of expenditure and base year (1986) dollars, respectively, based on the definition of fixed, mileage-related, and hour-related costs used in the allocation of operating costs. An important exception is that fringe benefits could not be allocated due to the level of aggregation in the data analyzed. The most significant findings are:

- fixed costs, in base year dollars, have remained relatively constant over the past three years.
- total operating costs, in base year dollars, have also remained relatively constant. Indeed, over the past several years, total costs have actually decreased, reflecting a slight reduction in the level of service provided.

Exhibits D. 6 and D. 7 show an allocation of Metrorail operating costs, in year of expenditure and base year (1986) dollars, respectively. The allocation separates fixed from variable costs, with the fixed costs defined in a similar manner as in the allocation of Metrobus costs.. Again, the level of aggregation in the data prevented the allocation of fringe benefit expenses. In base year dollars, the level of fixed and total expenditure has been increasing due to the significantly increasing level of service.

## Analysis of Cost per Vehicle-Mile

Exhibit D. 8 summarizes the level of Metrobus and Metrorail service provided during the period FY81 through FY86. Exhibits D. 9 and D. 10 present Metrobus operating expenses per platformmile in year of expenditure and base year dollars, respectively. In base year dollars, it can be seen that Metrobus costs were increasing in real terms until FY84. Since then, real costs have stabilized, due in part to WMATA's aggressive cost containment approach to managing costs.

Exhibits D. 11 and D. 12 present Metrorail operating expenses per car-mile, in year of expenditure and base year dollars, respectively. Metrorail expenses are shown to increase in real terms through FY84. Since then, real costs have declined, again due in part to aggressive cost containment by WMATA.

Analysis of Historical Metrorail Maintenance Staffing Levels
Additional investigation of historical maintenance staffing levels was undertaken because of the magnitude of Metrorail maintenance expenses and the concern that shifts in productivity levels in the rail car maintenance area may occur particularly as facilities and equipment have aged.

The WMATA operating budgets for FY82 through FY86 were the source of information for the following analysis. Staffing levels were investigated for the following maintenance areas:

- Facilities Maintenance
- Building and Support Equipment
- Custodial
- Track and Structures
- Rail Systems Maintenance
- Automatic Fare Collection (AFC)
- Automatic Train Control (ATC)
- Power

The staffing levels used in the analysis address positions allocated to Rail Operations only; they do not include capitalized positions. The driving variables are year-end values, rather than weighted averages for the year (such averages would be lower if a Metrorail phase opened in the middle of a fiscal year).

Exhibit D. 13 presents a summary of the historical trends in labor productivity in the above noted maintenance areas. The following observations can be noted:

- Building \& Support Equipment: The ratio has dropped since a high in FY83/84. The projected FY87 value is close to the FY85 value, but significantly lower than the FY86 value.

| Mecharics/Station | 1.77 | 1.72 | 171 | 1. 34 | 1.35 | 1. 33 |

- Custodial: Similar to the above-noted trend.
- Track \& Structures: Similar to the above trend. It should be noted that there have been several large, capitalized projects conducted in this area.
- Automatic Fare Collection: Productivity improved from FY82 through FY86. The increase in staffing required in FY87 is due to the extended hours of Sunday service. It should be noted that positions are budgeted on the basis of the number of AFC machines (farecard vendors, faregates, addfare machines, and kiosk equipment), rather than on the number of mezzanines, as is done in the cost model.
- Automatic Train Control: There has been an improvement in productivity since FY84, although FY86 was higher than FY85. The increase in FY87 is due to the extended hours of Sunday service.
- Power: There is a significant and steady improvement in productivity beginning in FY85.

## ADJUSTMENTS TO FY86 MODEL CALIBRATION

As noted in Chapter V, several changes were made to the FY86 cost model to better reflect the realities of the FY87 budget. These changes were generally in two areas:

- termination of old programs and initiation of new programs - changes in labor productivity and unit cost

These are described in more detail below.

## Termination of Old Programs and Initiation of New Programs

There are approximately $\$ 10$ million in old programs that will not recur in FY87. Some of these programs, such as the Flxible bus rehabilitation program, were previously addressed in the cost model.

There are many new programs and enhancements to existing programs whinc were not reflected in the FY86 budget. These new programs include the following:

| Office/Cost Area | Mode | \$ Change | Justification |
| :---: | :---: | :---: | :---: |
| General Counsel | Bus | \$189,637 | Increase work load |
|  | Rail | \$403,031 | Shift from capitalized |
| Treasurer | Bus | \$142,005 | Expanded programs |
|  | Rail | \$253,281 | Expanded programs |
| Budget \& Mgt Analysis | Bus | \$386,473 | Bus survey conducted every other year |
| Marketing | Bus | \$ 63,574 | Expanded programs |
|  | Rail | \$168,976 | Expanded programs |
| Facil Maint | Rail | \$600,000 | Expanded contr maint |
|  |  | \$400,000 | Escalator step replace (FY87 only) |
|  |  | \$345,000 | Track \& Struct parts (FY87 only) |
| Admin Services | Bus | \$315,241 | Expanded programs |
| Mgt Infor Svc | Bus | \$349,162 | New MVS installation |
|  | Rail | \$425,475 | New MVS installation (both FY87/88 only) |
| Planning | Bus | \$211,988 | New programs |
|  | Rail | \$ 95,935 | New programs |

Changes in Labor Productivity and Unit cost

## Workers' Compensation

Due to the aggressive management WMATA has undertaken in this area, substantial reductions in unit costs are anticipated. These management actions have included the contracting-out of the administration of workers' compensation claims administration and data processing, initiation of an in-house orthopedic clinic, and a broad range of loss control programs. This has resulted in a reduction of both the claims rate and average loss per claim:

| Mode | Unit cost |  |
| :---: | :---: | :---: |
|  | FY86 | FY87 |
| Metrobus | \$.2050/platform-mi | \$.1476/plat form-mi |
| Metrorail | \$.0850/sched car-mi | \$.0216/sched car-mi |

## Third Party Liability Claims

WMATA continues to experience losses in the third party liability area, despite aggressive management actions to control these costs. These actions hae included contracting out the
supervision of WMATA claims adjusters and data processing activities. However, defendant judgments have been frequent and have been growing in size. This is a growing trend in the industry and is characteristic of jury decisions in the region. It is partially due to the "deep pocket syndrome" common to public entity liability. The projected changes are as follows:

Unit Cost

| Mode | FY86 | FY87 |
| :--- | :--- | :--- |
| Metrobus | $\$ .1286 /$ platform-mi | $\$ .2048 /$ platform-mi |
| Metrorail | $\$ .0071 /$ sched car-mi | $\$ .0236 /$ sched car-mi |

## Insurance

The entire transit industry has been experiencing drastic increasing insurance premium costs. This has been the result of several factors, including:

- major losses in the entire insurance industry
- lower interest rates
- poor claims experience on the part of transit properties
- fewer insurance carriers in the market place

The following changes in premium rates are projected:

## Unit Cost

| Insurance Type | FY86 | FY87 |
| :---: | :---: | :---: |
| METROBUS |  |  |
| Fixed premiums | \$4,200 | \$7,900 |
| Mileage-related | \$.0170/platform-mi | \$.0322/platform-mi |
| Vehicle-related | \$216/peak veh | \$388/peak veh |
| Garage-related | \$1111/garage | \$1278/garage |
| METRORAIL |  |  |
| Fixed premiums | \$300,900 | \$639,400 |
| Mileage-related | \$.0382/sched car-mi | \$.0663/sched car-mi |
| Vehicle-related | \$1484/peak car | \$2503/peak car |
| Station-related | \$938/station | \$1686/station |

## Facilities Maintenance

The extension of the Orange line to Vienna will result in a very small addition to the staffing in this area. This is due primarily to the effiencies anticipated from satellite
dispatching centers for facilities maintenance crews. This arrangement will reduce the travel time for personnel to reach job sites. The effective changes in labor productivity are as follows:

Labor Productivity Measure

Bldg \& Struc Mech/Station
Janitors/Station
Track \& Str Crew/Route-Mi

| FY86 | FY87 |
| :--- | :--- |
| --- | $-\infty$ |
| 2.47 | 2.31 |
| 1.79 | 1.68 |
| 3.03 | 2.87 |

## Rail Car Maintenance

With 7 million additional rail car-miles projected in FY87, the Budget staff anticipates approving only 9 additional positions. This results in a greatly enhanced level of productivity and is based on the effectiveness of a $\$ 35$ million capital program undertaken during the past several years to increase rail car reliability. This program centered on correcting design deficiencies in many components of the 300 Rohr car fleet and the first of the Breda cars. These components included traction motors, compressors, lighting ballast, defrosters and other items with either frequent repair intervals or whose design made repair and replacement time consuming.

This chanye in labor productivity will save more than $\$ 4$ million in mechanics' wages in FY88. As seen below, the proposed staffing level results in the most efficient use of mechanic labor since before FY82:

| Year |  | Mechanics, Helpers | Scheduled Car-Miles | Mechanics per Million Car-Miles |
| :---: | :---: | :---: | :---: | :---: |
| FY82 |  | 298 | 17,440,000 | 17.087 |
| FY83 | Note 1 | 342 | 17,397,000 | 19.659 |
| FY84 | Note 2 | 370 | 17,840,000 | 20.740 |
| FY85 |  | 456.97 | 26,516,000 | 17.234 |
| FY86 |  | 483.41 | 28,733,000 | 16.824 |
| FY87 | Request | 515 | 36,810,800 | 13.990 |
| FY87 | Mark-Up | 492 | 35,788,800 | 13.747 |

Note 1: Total mechanics \& helpers $=359$. Assumes 17 assigned to capitalized projects.

Note 2: Total mechanics \& helpers $=422$. Assumes 52 assigned to capitalized projects.

It is reasonable to anticipate that as the Metrorail fleet ages, these dramatically increased levels of productivity will not continue. Most rail transit properties experience significant
increases in maintenance work loads as vehicle age. While there is no definitive data for determining the exact magnitude of the increase (either within WMATA or from other transit properties), the study asuumes maintaining the FY87 ratio through FY90, then increasing the ratio linearly to the FY86 value by FY2000.

## Rail Systems Maintenance

Only limited additional staffing is anticipated for the Vienna extension. This is due to more efficient use of manpower previously authorized. Extended hours of service on Sundays will result in additional staffing requirements in some areas:

|  | Old Staffing <br> Ratio | New Staffing <br> Ratio | Comment |
| :--- | :---: | :---: | :---: |
| AFC | 0.72 Mech per | 0.78 Mech per | Mezzanine |

## Electricity

Major reductions in the cost of electricity consumed by Metrorail are anticipated in FY87. Much of this results from the implementation of the recommendation of the Carnegie-Mellon study conducted several years ago and the absence of a utility rate increase. A slight increase in electricity use in bus garages is due to new maintenance facilities:

Unit Cost

| Electricity Use | FY86 | FY87 |
| :---: | :---: | :---: |
| Propulsion | \$.7849/sched car-mi | \$.6757/sched car-mi |
| Subway Stations | \$174,102/station | \$156,167/station |
| Other Stations | \$ 93,760/station | \$ 84,102/station |
| Bus Garages | \$166,722/garage | \$172,121/garage |

## APPENDIX E

## REHABILITATION AND REPLACEMENT INPUTS AND DETAILED RESULTS

This Appendix presents the detailed input data, assumptions, and results for the following rehabilitation and replacement analyses:

- Metrobus facilities and equipment
- Metrorail facilities, except track
- Metrorail equipment, except rail cars
- Track
- Rail cars

## metrobus rehabilitation and replacement

Exhibit E. 1 summarizes Metrobus rehabilitation and replacement costs for bus facilities and equipment. The Exhibit is divided into two sections. The first section summarizes inputs and the second section summarizes the replacement cost outputs. The inputs for 1973 through 1985 are shown on page 1 and include costs in year-of-expenditure dollars plus totals. Data for 1986 through 1998 are shown on page 2 and data for 1999, 2000, and totals for each category are shown on page 3.

The outputs are summarized on page 4 for 1973 through 1978. This page also shows the range of asset categories from the WMATA accounting system, the percentage of each asset category that is to be replaced, the replacement cycle, and the source of assumptions from within WMATA. This page also includes totals and various rolling averages. Results for 1979 through 1989 are summarized on page 5, for 1990 through 2000 on page 6, and 2001 through 2010 with totals by category on page 7.

Original Cost by Year Asset mas Capitalized

## METRORAIL FACILITIES REHABILITATION AND REPLACEMENT

Exhibit E. 2 summarizes rehabilitation and replacement costs for Metrorail facilities other than track. The Exhibit is divided into two sections, summarizing inputs and outputs. Inputs for 1973 through 1983 are shown on page 1 and include a summary of existing assets from the WMATA accouting system and additional assets for the uncompleted sections of the system. Inputs for 1984 through 1994 are summarized on page 2 and inputs for 1995 through 2000 with totals by category on page 3 .

Output summaries begin on page 4 with data for 1973 through 1978. Also shown are the categories within the WMATA asset accounting system, the percentage of each asset that is replaced, the replacement cycle, and the source of assumptions. As shown, many of the asset categories included in the inputs have been broken down into three separate useful life categories. The data on page 4 summarizes line structures, other special structures, and passenger stations. Similar information for parking facilities, buildings, yards, and third-rail are summarized on page 5, together with totals and rolling averages. Similar results for 1979 through 1989 are summarized on pages 6 and 7, for 1990 through 2000 on pages 8 and 9, and for 2001 through 2010 with totals by category on pages 10 and 11.

## METRORAIL EQUIPMENT REHABILITATION AND REPLACEMENT

Exhibit E. 3 summarizes rehabilitation and replacement costs for Metrorail equipment other than rail cars. The Exhibit is divided into two sections, summarizing inputs and outputs. Inputs for 1973 through 1983 begin on page 1 and summarize existing assets from the WMATA accouting system. Inputs for the uncompleted section of the system that are part of the Stark-Harris system are shown on page 2 and inputs for the remaining parts of the 103-mile system are shown on page 3 together with totals. Inputs for 1984 through 1994 are summarized on pages 4-6 and inputs for 1995 through 2000 with totals by category on pages 7 -9.

Output summaries begin on page 10 with data for 1973 through 1979. Also shown are the categories within the WMATA asset accounting system, the percentage of each asset that is replaced, the replacement cycle, and the source of assumptions. As shown, some of the asset categories included in the inputs have been broken down into several separate useful life categories. The data on page 10 summarizes miscellaneous equipment and facilities, elevators and escalators, power, and automatic train control (ATC). Similar information for automatic fare collection (AFC), data processing, and communications is shown on page 11. Totals and rolling averages are shown on page 12. Similar results for 1980 through 1990 are summarized on pages 13-15, for 1991 through 2001 on pages 16 - 18, and for 2002 through 2010 with totals by category on pages $19-21$.

## TRACR REPLACEMENT

Exhibit E. 4 summarizes the replacement costs for trackwork on the Metrorail system. The Exhibit is broken down into two main parts. The first part, on pages 1 and 2, summarizes input data. The first section of the Exhibit summarizes the type of construction, percentage of trackage by curvature group, and total construction cost of each segment of the system. Data through Wheaton are shown on page 1 with the remainder of the system on page 2.

The middle section of pages 1 and 2 shows inflation rates used to convert the historical costs in year of expenditure dollars to 1986 constant dollars. This section also shows the third rail factor of $71 \%$ which was used to compute the net cost for revenue track for the new sections of the system. Factors for 1973 through 1988 are shown on page 1 and factors for 1989 through 2000 are shown on page 2 .

The last section of pages 1 and 2 summarizes costs in 1986 constant dollars for each type of construction and curvature. These costs are summarized by year, based on the year of capitalization for the current system and the anticipated construction schedule for the remainder of the system. Costs for 1973 through 1988 are shown on page 1 and costs for 1989 through 2000 with a total are shown on page 2.

The second part of the Exhibit includes the results of the analysis which are shown on pages 3, 4, and 5. The total replacement cost is shown for each type of construction and curvature group, plus a total for the system. Both 5-year and 7 -year rolling averages are also shown on the Exhibit. Results for 1973 through 1988 are summarized on page 3, 1989 through 2004 on page 4, and 2005 through 2015 on page 5.

## RAIL CAR REHABIIITATION AND REPLACEMENT

Exhibit E. 5 summarizes rail car replacement and rehabilitation using a straight-line average annual cost calculated over the useful life of each fleet component. The Exhibit is broken down into three major sections. The top section summarizes characteristics of each major Metrorail fleet component including the number of vehicles, the year capitalized or placed in service, the rehabilitation and replacement periods, and the rehabilitation and replacement costs and payments. The top portion of the Exhibit also notes the vehicle replacement cost ( $\$ 1.1$ million), the rehabilitation percentage (32.11\%), and the fact that no interest earnings are computed on the accounts.

The middle section of the Exhibit summarizes the rehabilitation costs for each fleet component with a total for the system. The lower section of the Exhibit summarizes the replacement costs for each fleet component. Page 1 of the Exhibit shows the annualized values for 1986 through 2001 while page 2 shows the values for 2002 through 2015.

## APPENDIX $F$

## RAIL ALLOCATION PARAMETERS

Metrorail operating support is allocated to jurisdiction based on three factors:

- population density
- stations in operation
- ridership

The allocations, based on the above-mentioned factors, for the 1986 budget and the projections for 1993 and 2000 are shown in Exhibit F.1

In addition to the direct operating support, two WMATA programs result in addition support from the local jurisdiction. The first is a reimbursement from the District for the 10 cent reduction in fares for passengers boarding east of the Anacostia River. The second is a reimbursement for half the impcat of the "taper and cap" on rail fares. This reimbursement is allocated to jurisdiction based upon the riders benefiting from the discount. Both factors are summarized in Exhibit F.2. Montgomery County has the highest share of this fare support due to longer average Metrorail trip lengths from that jurisdiction.

## APPENDIX G

## JURISDICTIONAL ALLOCATIONS

#### Abstract

WMATA support for the various capital and operating categories was computed on an annual basis for the years 1986 through 2000 and allocated to each jurisdiction. State and Federal aid was computed for two alternative Federal funding scenarios and also allocated by jurisdiction. It should be noted that the assumptions are the same for 1986 under both scenarios. The inputs and outputs of this allocation process are summarized in the following Exhibits, primarily for the six major jurisdictions in the Washington area.

Exhibit G. 1 summarizes the basic non-WMATA inputs to the allocation process. The first table is Federal operating assistance, which is assumed to be available under the favorable Federal funding scenario. As noted Chapter VIII, the amount of Federal aid is considered constant in year-of-expenditure dollars or declining in constant dollars by almost half between 1986 and 2000.

The second table is a summary of debt service on the revenue bonds issued to fund the initial segments of the Metrorail system. Since interest on these bonds is a constant amount in year-of-expenditure dollars, the costs decline in constant dollars.

The third table contains additional data required for state aid calculations. The first item is the Federal operating assistance for the other WMATA jurisdictions (Fairfax City and Falls Church) and the second item is the debt service allocation for these jurisdictions. The next two items are estimates of operating expenses for Alexandria's DASH system and Fairfax County's Connector. The fifth item is the assumed total Virginia aid, a uniform amount in constant dollars. The last item is the assumed proportion of Virginia state aid allocated to capital projects (15\%), based on recent experience.

The final table includes factors for allocating Federal support to rehabilitation and replacement costs. The first item is the assumed amount of Federal funds available from formula programs under the unfavorable Federal aid policy (Alternative B) which is assumed to decrease in constant dollars. The last item is the assumed Federal aid matching ratio (25\%) under the favorable Federal aid scenario (Alternative A).

WMATA cost allocation inputs are summarized in Exhibit G.2. The first two tables on the first page are the rail capital
allocations under the favorable and unfavorable Federal funding scenarios. The third table on the first page is the allocated rail operating assistance and the fourth table is the allocated rail fare reimbursement.

The first table on the second page of Exhibit G. 2 shows the allocated bus operating support for the Metrobus system. The final table shows the total rehabilitation and replacement costs for buses, other bus system costs, rail facilities, rail equipment, and the annualized rail car costs.

Various factors for jurisdictional allocation of rehabilitation and replacement costs are summarized in Exhibit G.3. Some of these factors are also required for the various state aid formulas. The first table contains the factors for rail rehabilitation and replacement allocation and are the averages of the rail operating assistance allocations for the past five years.

The second table are the Metrobus mileage-related factors used in the allocation of bus operating costs, which are also used for the allocation of bus rehabilitation and replacement costs. The third table contains the allocated bus operating costs which are used in the state aid calculations.

The third table is an allocation of rail costs, calculated using the same proportions as the rail operating support. These costs are also required as input to the state aid formulas. The final table is simply the sum of the bus operating costs and the "allocated" rail operating costs.

Allocations of total WMATA support without regard to state aid are shown in Exhibit G.4. The first table on the first page shows the allocation of operating assistance, including Metrorail fare reimbursement, under conditions of favorable Federal aid. The second table shows similar allocations under conditions of unfavorable Federal aid. These tables are derived from the bus operating support, rail operating support, and rail fare reimbursement from Exhibit G.2. The first table then reflects a subtraction of the Federal operating assistance from Table G.I.

The third and fourth tables on the first page are allocations of rail rehabilitation and replacement costs under the two alternative Federal funding scenarios. These tables are derived by multiplying the total rail $R$ \& $R$ costs from Exhibit $G .2$ by the rail allocation factors from Exhibit G.3.

The last table on the first page and the first table on the second page are allocations of bus rehabilitation and replacement costs for the two Federal funding scenarios. These tables are derived by multiplying the total bus $R$ \& $R$ costs from Exhibit G. 2 by the bus allocation factors from Exhibit G.3.

The second and third tables on the second page are simply the sum of the rail and bus tables computed previously. The last two tables are the sum of the operating support and $R \& R$ allocations from this Exhibit, the revenue bond debt service from Exhibit G.1, and the rail construction allocations from Exhibit G.2.

Special calculations for Virginia state aid are summarized in Exhibit G.5. The first table is a single item showing the net available state aid after allocation of the total state aid to cover the debt service on the revenue bonds. Data for both the total state aid and the debt service are taken from Exhibit G.1.

The second table is Metrorail and Metrobus operating support for the Virginia jurisdictions, taken from Exhibit G.2. The third table includes the operating costs for Virginia Metrobus and Metrorail services from Exhibit G.3. Costs for Alexandria and Fairfax County also include the local bus system costs taken from Exhibit G.I

The fourth table shows the allocation of the net state aid to the Virginia jurisdictions based 75\% on total WMATA operating support and 25\% on total operating costs including local services. The final table is the portion of the total state aid assumed to be allocated to capital requirements, computed as $15 \%$ of the total as shown in Exhibit G.1.

Allocation of state support by jurisdiction in summarized in Exhibit G.6. Note that zero values are shown in all categories for the District of Columbia. The first table on the first page is the allocation for debt service, $100 \%$ for the Virginia jurisdictions and 75\% for the Maryland jurisdictions.

The second and third tables are state operating support for the favorable and unfavorable Federal funding alternatives. The Maryland support is computed by the formula described in Chapter VIII and the Virginia support is computed as the difference between the total support and the capital support as shown in Exhibit G. 5.

The last two tables on the first page summarize state support for rehabilitation and replacement costs. The Maryland support is assumed at 75\% and the Virginia support is taken from Exhibit G. 5 after application to rail construction.

Rail construction support is shown in the first two tables on the second page. Maryland support is assumed at 75\% and the Virginia support is taken from Exhibit G.5. The last two tables on the second page summarize the state aid for all WMATA support categories.

The allocation of net WMATA support after allowing for state aid is shown in Exhibit G.7. The tables were obtained by subtracting the state aid shown in Exhibit G. 6 from the total allocated support from Exhibit G.1 and G.4.

The first table on the first page shows the local contribution toward debt service. The next two tables show the contributions for operating support under the two alternative Federal funding scenarios.

The last two tables on the first page summarize local support for rehabilitation and replacement costs. The first two tables on the second page summarize local support for rail construction to complete the Metrorail system. The final two tables summarize local support for all WMATA programs.

## APPENDIX H

## IMPACT OF WMATA SUPPORT ON LOCAL JURISDICTIONS

The impact of WMATA support on the local jurisdictions is summarized in Exhibit H.1. The first two tables on the first page of the Exhibit summarize two primary measures of the local governments' resources and requirements. The first is local government operating expenditures for all non- WMATA services. The second is the total tax base for the major jurisdictions. All figures are expressed in millions of constant 1986 dollars.

The last two tables on the first page show the ratio of total WMATA support from Appendix $G$ to the operating expenditures of the six major jurisdictions. Calculations are shown for both favorable and unfavorable Federal funding sceanrios. Under the favorable funding scenario, regional values range from about 4.5\% to 5.0\%. Jurisdictional values are similar for the District and Montgomery County, somewhat lower for Fairfax County, higher for Prince George's and Alexandria, and about double for Arlington. Under the unfavorable scenario, the values are approximately double on a regional basis and for most jurisdictions during the peak rail construction period in the early 1990's. Thereafter, they decline to a level about one-third higher by the end of the century.

The tables shown on the second and third pages are computed for local shares of allocated costs after adjustment for state aid. The second page shows comparisons to operating budgets while the third page shows comparisons to the tax base. On both pages, the first two tables show the comparisons for WMATA operating assistance while the last two tables show compariṣons of support for the sum of operating assistance, debt service, and rehabilitation and replacement costs. Costs for rail construction are not included because of the uncertainties in how these costs will be funded by the different jurisdictions.

The values for the Maryland jurisdictions are much lower than for the other jurisdictions because of the relatively large amount of state aid assumed by applying the existing formulas. The values for the District, of course, are higher than for the other jurisdictions since no state aid is available.

APPENDIX I
HISTORICAL WMATA ASSISTANCE AND ABILITY-TO-PAY MEASURES
```

Exhibits I. 1 through I. 4 summarize gross WMATA assistance allocations and ability-to-pay measures for the years 1980 through 1983 or 1985, depending upon the availablility of data. All measures are shown before application of Federal or state assistance.

Exhibit I.l compares WMATA allocations to personal income of the residents of each jurisdiction. Exhibit I. 2 shows allocations compared to total earnings by place of employment. Exhibit I. 3 relates the WMATA allocations to taxable property values, including personal property except in the District of Columbia. Exhibit I. 4 compares the WMATA allocations to other expenditures of each local jurisdiction.

Exhibits I. 5 through I. 8 show the same four comparisons for net WMATA assistance allocations, after taking into account Federal and state aid.
