Preface

This report provides basic information for 1982 from each State on road-user taxes and property taxes levied on a selected group of vehicles. The Intent is neither to weigh the merits of any of the taxes being reviewed nor to recommend any tax policy, but to supply the means to measure and compare the annual payments that would be made for each of 15 carefully selected vehicles in each State. By arranging these payments in a uniform manner, a useful research and planning tool is made available to highway administrators, legislators, and others who are concerned with highways and with vehicles and their use.

The taxation information included for the vehicles, which range from a motorcycle to an 80,000 pound truck-trailer combination, is contained in the following:

- 1. Tables that show highway user and total taxes paid to each State.
- 2. Bar charts in which States are ranked by highway-user and total taxes paid.
- 3. Maps that show ranges of highway-user and total taxes paid to each State.

Introduction

In this report, individual road-user tax payments are compared for each vehicle, and total direct State road-user and personal property taxes are measured. With this information, comparisons can be made among vehicles, among States, and among types of service. The tax rates in effect January 1, 1982, have been used, and the taxes that would be paid for a full year in each State are shown for each vehicle studied. The objective is the measurement of payments, and it is not the intent to assess the merits of the taxes imposed nor to indicate support for or opposition to any tax policy.

During the past 31 years, eight studies were published by the Federal Highway Administration that compared the magnitude of State highway-user taxes and property taxes on a selected group of vehicles. These studies in 1950, 1953, 1956, 1960, 1964, 1968, 1970, and 1973 provided reference points along the full range of vehicle sizes and use classes so that comparisons could be made among States on the effect of each of the taxes, as well as the yield from the entire group of taxes.

For those who have used the earlier studies, the similarity of subject matter and methods of presentation in this one should be helpful. Some of the vehicles selected for this study differ slightly from those used in earlier studies. This selection reflects recognition of changes in usage and legislation governing vehicle registration, classifications, and weights.

As in the prior studies, the vehicles chosen as examples and the operating factors applying to them are considered to be representative of the kinds and sizes of vehicles generally in operation throughout the United States. The assumed amounts and condition of their use are believed to be reasonable; however, they are not claimed to be average. They were selected, rather, to show given points in the tax structures of the States. No consideration was given to the concentration of vehicles in various groups, a factor that will be of importance in applying the findings of this study.

The principal portion of current State road-user revenues is derived from the motor-fuel tax and from registration fees on motor vehicles. The need to generate additional revenues to provide for the increased costs of highway maintenance and construction has resulted in increased tax rates for gasoline in 35 States and diesel fuel in 33 States since 1975. Registration fees increased for automobiles in 21

States, for trucks in 26 States, for buses in 18 States, and for motorcycles in 25 States since 1975.

In an attempt to more equitably distribute the highway-user tax burden, three States adjusted the automobile registration fee and two States the truck fee since 1975. In this same period, one State, each, decreased truck, bus, and motorcycle registration fees.

The establishment, by legislation, of the variable tax rate is a recent development in motor fuel taxation. Washington was the first State to establish this type of tax rate in 1978 based on the price of motor fuel. Since then, Indiana, Kentucky, Massachusetts, New Mexico, and Rhode Island have established a variable tax rate. also based on the price of motor fuel, and the District of Columbia established this type of tax rate based on the Consumer Price Index. Three other States have established a variable tax rate in addition to a basic cents-per-gallon rate. They are Nebraska, with the variable portion based on price of motor fuel; Ohio, with the variable portion based on motor fuel consumption and highway maintenance costs; and Pennsylvania, with the variable portion based on highway petroleum product sales.

A study of the taxation of motor vehicles inevitably reveals some anomalies in the tax structures of the States. In some instances, these are the result of gaps or oversight in legislation. In others, they may have resulted either from a definite purpose or from developments not anticipated when the legislation was enacted. The most notable of course, was the adaptation of the diesel engine for highway yehicles and its use for years in many States without being subject to motor-fuel taxation. Now, all States except Vermont and Wyoming tax diesel fuel used on the highways. Vermont imposes registration fees on dieselpowered vehicles that are 75 percent greater than the registration fees for gasoline-powered vehicles, while Wyoming imposes a compensatory tax on dieselpowered vehicles that is greater than the tax on gasoline-powered vehicles. There is also no fuel tax shown on tables for diesel-powered vehicles in Idaho and Oregon. This does not mean that there is no tax charge, but rather that the manner of collection is through a special schedule of mileage taxes that contain an "in lieu" fuel tax portion.

The methods used and assumptions made in processing the data should be studied carefully to avoid misunderstanding. The methods and assumptions are shown in the "Specifications, Use Factors and Method of Presentation" section of this report.

The Typical Vehicles

The bases for registering motor vehicles vary considerably among the States. The most common basis for registering passenger cars is the flat fee, as shown in table 2, but there are several groupings and variations, e.g., Mississippi determines its levy by compounding a fixed fee and tax components based upon gross weight and vehicle age. Trucks and vehicle combinations are registered in 35 of the States on a gross vehicle weight basis, but among the remainder of the States there are many variations in the classification and taxation of trucks and combinations. The bases for registering trucks are given in table 3. Table 4 shows the basis for registering a common carrier bus in intercity, intrastate service. The most common basis is gross weight; empty weight and seating capacity bases are also widely used. A flat rate is applied in four States, and in others combinations of these factors plus additional bases, including age, horsepower, and number of axles, Motorcycles are registered on a flat fee basis in all but four States. In Hawaii and New York, motorcycles are registered according to weight, in South Dakota they are registered on the basis of engine displacement, and in Iowa they are registered on the basis of age.

The determination of whether data from any State for any given vehicle would be included or excluded from the study was based primarily on whether the vehicle, as specified, would be registered and permitted to operate in that State. In some States the vehicle or combination could be registered but could not be operated legally with a full load. All such vehicles were omitted from the study, even though they could be registered and might sometimes be operated on the highways of the State with slightly lower gross weights. Where minor variances of axle spacing would permit a vehicle to be used legally in a State, it was assumed for study purposes that the vehicle so altered was essentially the same as that described in the specification sheet and could be reasonably compared with the vehicle of the same description from other States. Consideration was given to any allowance permitted by law relating to scale accuracy or enforcement tolerances.

A direct comparison between the two heaviest truck combinations is not possible due primarily to the increase in weights since the earlier study. The trend toward heavier vehicles and the increase in number of States permitting these vehicle combinations, however, is readily apparent from a comparison of data between the two studies. The 1973 study showed that both of the vehicle types were permitted in 17 States. The 1982 study shows that these vehicle types (No. 12 and No. 13) are permitted in 30 States even though the current vehicle specifications show an increase in gross weight.

Both vehicle types are now allowed in five States where neither was before: Florida, Iowa, Minnesota,

New York, and Wisconsin. In 1973, only the tractorsemitrailer, full trailer combination was permitted in Indiana, Kansas, Kentucky, Maryland, North Dakota, Oklahoma, South Dakota, and Texas. In 1982 both are permitted.

The status of the two largest truck combinations (No. 12 and No. 13) is shown geographically in figure 5.

Tractor-semitrailer combinations are registered as single units in 40 of the States; in 7 States and the District of Columbia, tractor trucks and semitrailers are registered as separate units; and in 3 States, they may be registered as single units or separately. In this study, combinations are considered to be registered as single units in those States where the fee for either the tractor or the semitrailer is based on the gross weight or capacity of the combination, even though in most of these States a relatively small fee is also levied on the other unit of the combination. In the three States in which the owner has the option of registering his combination as a single unit or as separate units, it has been assumed that the owner would choose the method that would result in the lowest registration fee. The States were asked to rate the vehicles as they are customarily requested by the owners, thus, Montana showed combinations registered as separate units while Delaware and Washington showed combinations registered as single units.

Fifteen vehicles were selected to illustrate the range and magnitude of State taxes on motor vehicles: three passenger cars, five single-unit trucks, five vehicle combinations, a bus, and a motorcycle.

Their relative sizes and axle arrangements are shown in silhouette inside the front cover. The vehicles selected are in general use and are sufficiently similar to vehicles selected for the preceding studies to permit comparisons. The user is reminded that the basic purpose of this study is to present a series that permits comparison of the tax scales of the States at several points, rather than to present common or average vehicles. Description of the vehicles follows:

Passenger Vehicles:

No. 1 - A lightweight sedan.

No. 2 - A mediumweight sedan.

No. 3 - A heavyweight sedan.

No. 14 - A 47-seat, diesel-powered, intercity bus.

No. 15 - A motorcycle.

Single-Unit Trucks:

No. 4 - A gasoline-powered pickup truck registered for 5,000 pounds gross weight.

- No. 5 A gasoline-powered stake truck registered for 14,000 pounds gross weight.
- No. 6 A gasoline-powered van truck registered for 24,000 pounds gross weight.
- No. 7 A diesel-powered van truck registered for 24,000 pounds gross weight.
- No. 8 A tandem-axle diesel-powered dump truck registered for 50,000 pounds gross weight.

Vehicle Combinations:

- No. 9 A three-axle tractor semitrailer, gasoline-powered, registered for 40,000 pounds gross weight.
- No. 10 A four-axle, tractor semitrailer (tandem axles on the semitrailer), diesel-powered, registered for 60,000 pounds gross weight.
- No. 11 A five-axle, tractor semitrailer (tandem axles on both units), diesel-powered, registered for 78,000 pounds gross weight.
- No. 12 A five-axle combination consisting of a two-axle diesel-powered tractor-truck, a single-axle semitrailer, and a two-axle full trailer, registered for 80,000 pounds gross weight.
- No. 13 A five-axle combination consisting of a three-axle diesel-powered truck and a two-axle full trailer registered for 80,000 pounds gross weight.

The automobiles for this study were selected to be comparable in weight to those used in the previous study. This was done to reflect the high and low rates in the State taxation structures for many of the 20 States and the District of Columbia that base their registration fees on weight, to aid in comparison of like-sized vehicles between the two studies and to reflect the total automobile fleet mix rather than the mix for the 1980 model year.

A major development since the previous study has been the decrease in the size, weight, and horsepower of the automobiles produced and sold. The primary causes of this trend are federally mandated fuel economy standards and the public's desire for more fuel efficient automobiles in the face of rising fuel costs. Care should be taken to make allowances for this development when using the figures in this study, particularly the registration fee and motor-fuel tax figures.

Another development since the previous study has been the increase in the maximum vehicle weights permitted in a number of States, increased use of heavier trucks, and the increased use of diesel engines in the lighter-weight trucks. Consequently, the gross weights of the combination trucks over 40,000 pounds have been increased and a 24,000 pound diesel-powered truck has been included. The 55,000-pound four-axle tractor -semitrailer combination has been increased to 60,000 pounds, the 72,000-pound five-axle tractor semitrailer combination has been increased to 78,000 poounds, and both the five-axle tractor - semitrailer and full trailer combinations have been increased from 72,000 pounds and 76,000 pounds, respectively, to 80,000 pounds. The 55,000-pound gasoline-powered four-axle tractor -semitrailer combination has been dropped.

To compare taxes on vehicles that differ primarily in the fuel used, data have been included on two types of 24,000 pound van trucks (Nos. 6 and 7). One type has a gasoline engine and the other a diesel engine. An arbitrary assumption, but one considered reasonable, was made of a fuel-consumption rate of 5.9 miles per gallon for the gasoline vehicle and of 6.9 miles per gallon for the diesel vehicle.

Nine States impose a higher tax on diesel fuel than on gasoline. These States, and the tax rates in cents per gallon as of January 1, 1982 are as follows:

State	Gasoline	Diesel
Alabama	11	12
Arkansas	9.5	10.5
Iowa	13	13.5
Kansas	8	10
Mississippi	9	10
Montana	9	11
New York	8	10
Tennessee	. 9	12
Texas	5	6.5

Specifications, Use Factors and Method of Presentation

In 1981, a detailed statement of specifications for each of the 15 vehicles selected was sent to the State authorities for determination of the specific fees and taxes that would be payable on them during a full year under laws existing January 1, 1982. Table 1 shows these specifications together with the assumed annual mileage traveled, motor fuel consumed, and other factors needed to compute the various taxes that would be paid. The State road-user levies to be reported were motor-fuel taxes and vehicle registration fees, other annual vehicle fees closely related to registration, and the applicable motor-carrier taxes. In addition, all direct personal property taxes levied on motor vehicles by all levels of government were to be reported. The property taxes for 1982 were generally estimated by the State authorities on the basis of 1981 property assessments and tax rates. However, where the 1982 rates and valuations were available they were used.

The same care that was taken in the selection of vehicles was taken in the selection of use factors. Average values were not available for travel mileages, fuel consumption rates, and earnings for each selected vehicle. It was, therefore, necessary to assign values arbitrarily, but special effort was made to select amounts that were reasonable. The objective was to supply specific factors to which tax rates could be applied uniformly in all States and to present data reflecting these rates to permit valid comparisons among States, vehicles, and services.

In order to avoid the complex situations that would have been encountered in computing taxes on vehicles in interstate operation, intrastate was specified. Without this stipulation, the study would have been unduly complicated by the necessity of having to (1) include the additional taxes and fees applicable only to interstate carriers, and (2) consider an almost infinite variety of circumstances, especially the various reciprocity and/or proration agreements. Obviously, few large combinations travel entirely in one State for an entire year. However, the stipulation of intrastate travel was permissible, even indispensable. because the purpose of the study was to compare tax rates rather than to select typical vehicles or the most probable amount and kind of service for the most probable tax payments. It was specified that the vehicles were assumed to have been operated in the same State since purchased new in 1980. This made 1982 the third year of registration and thus excluded from the study nonrecurring taxes, such as those on sales and titling, and removed the vehicles from the top property tax brackets.

Although the types of vehicles used on farms vary widely, it was decided to show farm service for the

pickup and the stake trucks only. Figure 10 shows a comparison of the registration fees charged for farm and for private use of the 14,000-pound gross weight stake truck.

In this study, the group of taxes imposed by the Federal Government on gasoline, vehicles, tires, and associated products has been specifically excluded, as has the annual use tax on vehicles of more than 26,000 pounds gross weight. These levies have been excluded because they are uniform throughout the Nation and would have no effect on the comparisons among States. Similarly, local taxes and fees, other than property taxes, are not included. Many counties and cities impose registration fees or additional motor-fuel taxes, but the inclusion of these levies is beyond the scope of this study.

The data received from the States are presented for the individual selected vehicles in tables 7 to 20 and figures 11 to 33. In all of the tables, the States are arranged in regional groupings to permit ready comparison of data for each State with data for its neighbors. The figures show the principal groups of taxes and permit a quick comparison of the elements reported and among the States.

The national average and extremes are shown in table 5. The averages are unweighted arithmetic averages of the totals for all States in which the vehicles are permitted to operate. In figure 9 a comparison is shown of the low, average, and the high annual rates on four of the vehicles covered in the study. (Note the two different vertical scales in the figure.)

Probably no vehicle would incur exactly the annual amounts shown in the tabulations, and this is particularly true for the large commercial vehicles. Consideration was given to reporting tax payments on the basis of ton-miles of operation or vehicle-miles of travel, but to do so would have been going substantially beyond the limited objectives of this series of studies. Furthermore, comparison of the annual taxes was more advantageous because such amounts are more readily understood by the layman, many of the taxes and fees are levied on an annual basis, and by using the same assumptions, the relative positions of the States are the same on either an annual or a vehicle-mile basis.

Although there would be no differences among the relative positions of the States when their vehicle taxes were compared on an annual basis or on a vehicle-mile basis because of the equal travel assumption, the annual mileage assumed for each vehicle for the purpose of making the comparison is important. Since all travel is

assumed to be intrastate, the mileage factors are especially important. If the annual mileage figures assumed were too small, States having relatively large license or other annual fees but no mileage taxes would be placed in an unfavorable position in relation to States that have low annual fees and impose mileage taxes. But, if assumed mileages were too great, from

the viewpoint of the taxpayer, the States imposing mileage taxes would be placed in an unfavorable position in comparison to those that depend principally upon annual fees for the taxation of heavy vehicles. The mileages shown for the larger vehicle types are not intended to be averages, but should be considered reasonable compromises of the miles they actually travel.

Road-User Taxes

Historically, road-user taxes have been divided by most authorities into three major groups, the most important being fuel taxes and miscellaneous fees incidental to fuel taxation. The second major group, usually termed motor-vehicle revenues, consists of motor-vehicle registration fees and other related fees, some of which are not paid annually (e.g., title fees, drivers' license fees, and other revenues of relative minor importance). The third group, motor-carrier taxes, has in the past consisted primarily of special taxes on for-hire carriers. However, the so-called carrier taxes have evolved into a broader, more varied group and are no longer as closely associated with forhire carriers as they were in earlier years. Such taxes. which have come to be known as third structure taxes. include vehicle-mile, ton-mile, axle-mile, and similar taxes applied without regard to whether the vehicle is used in for-hire service or is in private use.

In the past, the three major groupings have afforded adequate classification of road-user revenues, although there were borderline instances in which there has been considerable question concerning proper classification. The most common of these borderline cases is the annual registration fee in States that levy higher rates on for-hire carriers. The differential between the registration fees for private and for-hire operation possibly could be considered in this study under the theory that carriers' vehicles, as a rule, can be expected to be operated more miles than vehicles in private operation, and, therefore, the higher registration fee for carriers' vehicles serves as an adjustment for the greater mileage.

Another example of borderline classification is the special registration fee charged for diesel-powered vehicles. An argument can be made for classification of these additional fees as fuel taxes, but they have not been so classed in this study. The important consideration is the overall fairness of the State's tax system, and this must be measured, finally, by the total taxes collected on the vehicles.

The methods of accounting for and reporting tax liability sometimes impose additional costs not reflected in the tax payments. No effort was made in this study to determine the amounts or effects of any such costs. Although the effects of the historical development are still present in the tax structures of many States, the tendency to impose taxes on for-hire carriers that are not imposed on private carriers or to levy higher rates on for-hire carriers seems to have diminished.

Mileage taxes are based on vehicles and their use and make little, if any, distinction between operation of a transportation service for profit and operation incidental to the conduct of another enterprise.

Mileage taxes can have two distinct advantages: They should yield considerable amounts of revenue; and, they should be imposed, in theory, at rates that take into account the value of service received and the cost of providing that service-the cost of highways. Mileage taxes also have at least two major disadvantages. The more important of these, from the States' point of view, is the cost of administration. The cost of establishing and maintaining complete records, weighing stations, and an enforcement staff is substantial and consumes a relatively greater proportion of the revenue collected than do the other two basic revenue producers-the gasoline tax and registration fees. The second disadvantage is the necessity for the vehicle operators to maintain records for filing the reports required under a mileage tax. This can constitute a sizable burden on the vehicle owner over and above the actual amount of tax paid, but the disadvantage may become one of diminishing importance, particularly in States that are members of registration proration compacts. Two such compacts are the Uniform Vehicle Registration Proration and Reiprocity Agreement (UPRA) with 20 States, and the International Registration Plan (IRP) with 27 States. Fifteen States are in both plans with, generally, the IRP taking precedence over the UPRA. In the proration States, vehicle owners and operators must keep complete records of the vehicle-miles of operation of each piece of equipment and send reports of this information to each of the States in which their vehicles are prorated under the UPRA compact or their home-based State under the IRP. There would be little. if any, additional information required for mileage tax application.

Although tolls collected are, in effect, another form of mileage tax, they are omitted from this study. Tolls have played an important part in financing a few of the principal routes of interstate traffic, but their effects are largely concentrated in the eastern half of the United States, and the use of toll roads varies so greatly among different regions, users, and classes of vehicles, that the application of acceptable factors for general estimates and comparisons is impossible within the scope of this study. Furthermore, the use of toll routes (and payment of tolls) is optional rather than mandatory.

In the tax comparisons and discussions in this study of vehicles in motor-carrier service, gross receipts taxes and other levies that are imposed on general business--levies that are not limited to motor carriers--have been excluded, even though their chief impact, in some instances, seems to be on highway vehicles. Fees for authority to operate and other fees paid only at the time a carrier begins to haul goods for hire have also been excluded. However, in many instances, the motor-carrier fees shown include license and permit fees that must be paid annually.

The majority of trucks are used in ordinary private service, but even these are subject to mileage or other carrier taxes under some conditions. Such variations in the tax structure of the States made it necessary, in this study, to make a few judgments relative to the inclusion or exclusion of these special levies.

A general policy was to include only the taxes normally paid on vehicles in a given group. For example, the laws of some States are written so that heavy trucks must pay certain mileage or compensatory taxes whether used in private or contract operation. In the same States, light trucks are not subject to the tax. In such cases, the tax is shown only for the heavier vehicles, because the purpose of the study is to present a comparison of tax burdens on certain selected vehicles rather than to include all of the taxes on all vehicles. Many of the larger trucks traveling in interstate commerce are subject to higher taxes than are reported in this study. The assumption of equal usage in all States allows for meaningful comparisons.

Types of Service

Most States have distinctly different tax rates for commercial vehicles in personal use or private operation (not for hire), in common or contract carrier operation (for hire), and in farm service. Vehicles in personal use or private operation are those used by the vehicle owner solely for his transportation or for carrying his own goods with no direct transportation charge.

Contract carriers are those employed in hauling goods for others with a direct transportation charge, at times and to destinations required by the jobs for which they are hired.

Common carriers are those operating vehicles for hire over established routes and on fixed schedules.

Contract carriers and common carriers operating vehicles for hire are usually subject to State regulation controlling their operations. Generally, the public utility commission or public service commission is the regulatory agency.

Information was obtained and tabulated for the study vehicles under the various types of service to account for the differing tax rates. The automobiles (Nos. 1, 2, and 3) and motorcycle (No. 15) are shown for personal use, the pickup truck (No. 4) for personal use and farm service, the stake truck (No. 5) for private and contract carrier operations and farm service, the dump truck (No. 8) for private operation, and the bus (No. 14) for common carrier operation. The other vehicles, trucks and truck combinations are shown for private operation and contract carrier operation.

The freight carriers in this study were assumed to be in contract for-hire service rather than common carrier service, since the operating characteristics of the former are more consistent with the explicit assumption that all travel is intrastate. To include combinations in common carrier service, operating primarily interstate, would result in a gross distortion if the fees were calculated on the basis of intrastate travel.

The bus was assumed to be in common carrier service, since an overwhelming proportion of intercity

bus service is by common carrier. A sufficient number of trips in most States are intrastate so that applying the intrastate travel assumption in calculating taxes should yield reasonable totals.

The farm-service classification includes vehicles registered at a reduced fee without restriction as to the highways they may use. Farm vehicles registered by some States at a nominal charge imposed as the sole registration fee and licensed for restricted operation on or in the immediate vicinity of the farm have not been included in this study.

Farm trucks are registered at reduced rates in 39 States. The registration fee reductions vary, not only among the States, but also vary somewhat for vehicles of different capacities.

This can be seen from a comparison of figures 7 and 8. Many farm trucks are in the lighter weight groups, and what may at first glance appear to be relatively minor concessions in the form of reduced registration fees can, in fact, be of major importance from a revenue standpoint, particularly in predominantly agricultural States. The reduction in registration fees for a farm truck can be substantial. In 20 States the amount of the reduction can be 50 percent or more compared with the same truck in private operation.

A comparison of the registration fees for the 14,000-pound stake truck (No. 5) for private use and farm service is shown in figure 10. If classified as a farm truck, this vehicle is allowed a reduction in the registration fee of more than 75 percent in 5 States, 50 to 75 percent in 15 States, and less than 50 percent in 18 States.

When considering the equity of reduced registration rates for farm trucks, it should be remembered that farm trucks generally average fewer miles per year on highways than other trucks, and therefore, the reductions are not as large on a centsper-mile basis as they might appear from the comparisons shown in tables 8 and 9 and figures 7 and 8.

Property Taxes

In most States, property taxes on motor vehicles have little or no direct relation to the use of highways, and the revenues from these property taxes are not available for highways. They are, however, so closely associated with registration fees in their application and their relation to costs of operation and they comprise such a large portion of the total taxes paid on motor vehicles in some States that their inclusion in this study was necessary in order to obtain equitable The registration fees for individual comparisons. vehicles vary considerably among the States, and property taxes in some instances greatly exceed the registration fees paid, but when property taxes and registration fees are considered together, differences among the States are generally smaller.

Figure 4 shows the States in which State or local property taxes are levied and the States in which registration fees and special license taxes are in lieu of ad valorem or property taxes. In this connection, the registration fees of many States are based, at least in part, on the age or valuation of the vehicle.

In the tables in this study, registration fees in lieu of property taxes are reported with registration fees. Other taxes and fees reported by the States in lieu of property taxes but are ad valorem in nature are considered property taxes for the study. These fees are identified by various titles, including permit and county fees, specific ownership, privilege and excise taxes. These excise taxes should not be confused with one-time, new-vehicle, or resale excise taxes which are not included in the study. Property taxes are generally based on the current value of the vehicle and are paid annually.

In Alaska, a local tax is collected on weight and age of the vehicles to take the place of a property tax. This amount is shown under other taxes and fees in the tables in this study.

Louisiana and Texas permit local property taxes to be levied in addition to the registration fee. However, in Louisiana, such levies are not generally applied. In the case of Texas, the figures shown in the tables are for the capital city, which does not levy these taxes.

In New Hampshire, a Municipal Permit on motor vehicles is a prerequisite for State registration. Although it is not called a personal property tax, the fee is charged on an ad valorem basis and is shown on the tables as a property tax.

The valuation of motor vehicles for tax purposes is generally conceded to be much closer to market

value than the valuation of other personal property-household furnishings, for example--subject to the same taxes. It is also probable that motor vehicles constitute a substantial portion of taxable personal property in many jurisdictions. Therefore, although this study is not directly concerned with personal property taxes per se, they are of considerable importance in the analysis of the total tax burden on the motor vehicle, either by those concerned solely with highway finance or with research in broader fields of public finance.

In Oklahoma, the registration fee on the medium-weight sedan is \$92.61, a larger fee than for any other State, but Oklahoma levies no property tax on automobiles. In Arizona, the registration fee of \$8.00 is one of the lowest among the States, however, it levies a tax in lieu of a property tax of \$103.12. This tax must be paid before the vehicle can be registered. The combination of these two taxes in Arizona total more than the registration fee in Oklahoma.

Six States impose a registration fee of \$40.00 or more on the mediumweight automobile cited in this study. None of these States levy a property tax on this vehicle

The relation of property taxes to registration fees and the relative importance of property taxes as a part of the total tax burden on the automobile owner is illustrated in the tables for the individual vehicles in this study. Another factor that demonstrates the close relationship between registration fees and property taxes is the reduction of the registration fee in several States according to the age, and therefore value, of the vehicle. As noted previously, this is a general rule in applying property taxes. Nine States use the factor of age, to a greater or lesser extent, in determining the registration fee on automobiles.

The property taxes that are given in the tables, except for the farm vehicles, include all such taxes levied by the State, county, city, or other local governmental unit in which the vehicle is domiciled, and these are the taxes that would be imposed on the vehicles in the capital city of the State. The property taxes given for farm vehicles include State, county, and district, or other property taxes that would be collected in a typical, rural agricultural community in the State. In a few States, where uniform statewide property valuation and State rates were in effect in all jurisdictions, there is no difference between property taxes on farm vehicles and vehicles registered in the State capital.

Administration and Application

Motor-Vehicle Texation

Although this study is based primarily on legislation, it is appropriate to call attention to administration and enforcement as they affect vehicle taxation.

Two of the most important considerations in any revenue legislation are administration and application or enforcement. Highway-user revenue legislation is no exception. The interpretation of the laws, simplicity of the instructions and required forms or reports, and the ease of collecting the revenues are administrative decisions of great importance. These decisions take on even greater significance with the passage of new revenue legislation, the updating of current legislation, and the modification of revenue collection procedures. Any review of highway-user taxation will show many similarities in the laws, as written, and even in the required forms and reports used by the various States. This is understandable since most laws are thoroughly researched before passage and the experience of other States in administering similar laws is studied.

In the area of application or enforcement, however, greater variations are evident between the States. The interpretation and application or enforcement of road-user taxes in one State compared with another having similar tax laws may easily cause substantial tax differences on similar vehicles in similar service.

The payment of motor-fuel taxes is an item that merits close examination. Most persons familiar with the subject agree that some gasoline used on the highways escapes taxation (through refund and exemption) and that the amounts undoubtedly vary greatly among the States. There is no way of knowing how much revenue escapes through excessive refund claims, but the total may be considerable. During 1980, one State refunded or exempted 19 percent of the total motor fuel consumed. In five other States, claims for nonhighway use of motor fuel were from 16 percent to 11 percent of all motor fuel used. Nationwide, the average was 4 percent. There appear to be many ways of avoiding or evading the tax on diesel fuel, and State authorities charged with collecting it are in general agreement that a considerable amount escapes taxation. The fact that kerosene and some heating oils can be used as diesel fuel substitutes makes it probable that collection of the tax will remain a problem for Diesel-fuel taxation is undergoing some time. increased scrutiny with the increased use of diesel fuel in light trucks and automobiles. The problems of collecting motor-fuel taxes may have been an influence

on some State legislatures that have tended to levy larger-than-average ownership taxes (registration fees, sales taxes, and associated fees) rather than taxes on vehicle use (motor-fuel taxes).

Even in the area of registration fees, variances can occur between States with similar fee schedules. These differences often are due to different determinations of the loads to be carried.

The administration and application of highwayuser taxes take on an even greater importance with the changes in the economic conditions and increased revenue needs for the building and maintaining of highways.

In an exhaustive comparison of road-user taxes in different States, it would be pertinent to examine practices and interpretations in the application of the existing statutes, but in this study, no allowance was made for such differences.

Motor-Vehicle Inspection

Half of the States require motor vehicles to be inspected periodically. The inspections vary as to type of inspection stations used, frequency of inspection, vehicles required to be inspected, cost of the inspection to the motorist, and disposition of the fee.

We have included the discussion of the motor-vehicle inspection program in this section rather than with road-user taxes since the States' portion of the inspection fee is generally nominal and is normally used to defray the cost of providing the inspection stickers and maintaining files instead of being used as a revenue producing tax in most of the States.

In addition to the 25 States and the District of Columbia that require annual or semiannual inspection, 7 conduct random or spot inspections. The fees range from \$2.50 to \$15.00. Only two States and the District of Columbia own and operate their own inspection stations. In the others, the inspection is performed in State designated and supervised privately owned facilities.

The States' portions of the inspection fees range from \$0.00 to \$5.00. The States' shares of the inspection fees are included with the road-user revenues in the tables in this study.

Table 19 summarizes the State inspection programs. These inspection programs are not to be identified with safety equipment inspections of commercial vehicles conducted by regulatory agencies in many States.
