### the ISSUE

No locally calibrated tool is available to capture the complexity of the current and future public benefits of proposed access management for estimating financial and other benefits and comparing them with the associated financial costs.

### the RESEARCH

Researchers have determined needs and available resources through a literature review and interview process. They developed a benefits estimation methodology focused on benefits related to traffic operations, traffic safety, environmental impacts, and project costs, and subsequently developed spreadsheet software tools that implement the benefits estimation and calculation of traffic safety benefits, using Synchro/SimTraffic for estimating traffic operations and environmental impacts.

A University Transportation Center sponsored by the U.S. Department of Transportation serving the Mountain-Plains Region. Consortium members:

Colorado State University

Administration

## the FINDINGS

The result is a simple, straightforward benefits estimation methodology focused on benefits related to traffic operations, traffic safety, environmental impacts, and project costs. The methodology is facilitated by the two spreadsheet software tools that implement the benefits estimation and the calculation of traffic safety benefits, utilizing Synchro/SimTraffic for estimation of traffic operations and environmental impacts.

## the IMPACT

With a straightforward methodology, SDDOT can more effectively communicate with the public and concerned citizens regarding potential access management projects. Using the software, analysts will follow a consistent analytical procedure with related calculations and results generated by the software rather than manually, therefore saving time. These results will be consistent from project to project, supporting design and access management decisions. Additionally, consideration of the traffic operations, traffic safety, and environmental impact measures are key to an improved and sustainable transportation network.
