FILMS FOR HIGHWAY SAFETY AND TRAFFIC ENGINEERS

Research, Development,
and Technology
Turner-Fairbank Highway
Research Center
6300 Georgetown Pike
McLean, Virginia 22101-2296

Report No.
FHWA-IP-86-25

Implementation Manual

December 1986

U.S. Department
of Transportation

**Federal Highway
Administration**

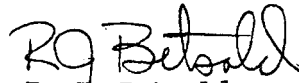

This document is available to the U.S. public through the National Technical Information Service, Springfield, Virginia 22161

FOREWORD

A large number of traffic engineering and highway safety technology transfer items have been documented by audiovisual aids. Much of the documentation has been prepared in nontechnical jargon, which would permit traffic engineers and other highway safety professionals to use the materials to educate general audiences; other materials are technical in nature, suitable for training purposes. Unfortunately, knowledge of the audiovisual aids' existence, technical content, whereabouts, format, and availability often is not matched with the practicing engineer's need for this information.

This synthesis of films bridges the gap between knowledge and need. It has been prepared to inform the practicing traffic engineer and highway safety professional about the numerous films that are available for education and training purposes. This synthesis provides sufficient information to enable the reader to understand the content of each film, film format, audience applicability, and available sources for purchase, rental or loan. It permits the reader to select those films that will be most beneficial considering available personnel, funds, and equipment.

With the increasing popularity of videocassette recorders and cameras, many existing films are being re-recorded and many new films are being planned or are in production. Therefore, periodic updates of this synthesis are anticipated. Readers who wish to provide input to future syntheses are encouraged to use the forms provided in the back of this volume. Information about this synthesis or future syntheses can be obtained by writing the Safety and Traffic Implementation Division, FHWA (HRT-20), 6300 Georgetown Pike, McLean, Virginia 22101

R. J. Betsold
Director, Office of Implementation
Federal Highway Administration

NOTICE

This documentation is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its contents or use thereof.

The contents of this document reflect the views of Analysis Group, Inc., which is responsible for the facts and accuracy of the data presented herein. The contents do not necessarily reflect the official policy of the Department of Transportation.

This report does not constitute a standard, specification, or regulation.

The United State Government does not endorse products or manufacturers. Trademarks or manufacturers' names appear herein only because they are considered essential to the object of this document.

15. Supplementary Notes FHWA Contract Manager: William L. Williams, P.E., HRT-20 FHWA Contract Administrator: Ann G. Argaman, HCP-42			
16. Abstract <p>This document provides abstracts on audiovisual aids of potential interest to highway safety and traffic engineers. Each film abstract includes a description of the film's contents; the source(s) from which it is available for purchase, rental, or loan; the format(s) in which it is available; the length of the film (or number of slides); and, where available, the production year and identity of the target audience.</p> <p>The films abstracted in this synthesis come from a variety of sources, both public and private. While some are very technical in nature, others would be suitable for general audiences. For example, a number are aimed at teaching traffic safety skills to children, others are targeted at driver education students, and still others stress the importance of using seat belts or the dangers of drinking and driving.</p> <p>A subject index of key words is provided for all the films, which are listed in alphabetical order. Addresses for sources from which to order films are also provided. The index of contents appears on the back cover.</p>			
17. Key Words Synthesis, Catalog, Films, Audiovisual aid, Movie, Videocassette, Slides, Slidetape (Also see Key Words in the Subject Index.)		18. Distribution Statement No restrictions. This document is available to the public through the National Technical Information Service, Springfield, VA 22161.	
19. Security Classif. (of this report) Unclassified	20. Security Classif. (of this page) Unclassified	21. No. of Pages 188	22. Price

HOW TO USE THIS CATALOG

Film descriptions are listed in alphabetical order by film title. The alphabetical order ignores spaces between words, ignores "A," "An," and "The" as the first word of any title, and assumes numbers are spelled out. The subject index is in alphabetical order by key words. If you want to find out what films are available on, say, pedestrian safety, you look up "pedestrian safety" in the subject index. There each film about that subject will be listed by number. A006 refers to the sixth film in the "A" section, D004 refers to the fourth film in the "D" section, and so on.

Each film description contains an abstract, sources for buying, renting, or borrowing the film, the formats in which the film is available, the length of the film, cost information, and the key words by which the film is indexed. Most of the abstracts were provided by the supplier of each film and some are more detailed than others. Where the information was available, we have indicated the type of audience for which the film is targeted, who produced the film, and the year in which it was made. Cost information was obtained during late 1985 up to mid-1986; price increases may have occurred by the time you order a film.

Only abbreviations or acronyms identify the sources in each film description. A complete list of sources immediately follows this section. We strongly recommend contacting the source directly in advance of ordering a film to verify format and price information. Be aware that foreign-made films may not be compatible with U.S.-made equipment and vice versa. Some sources who loan or rent films require you to insure the films and pay postage in addition to the rental fee. There also may be restrictions on the amount of time you may borrow/rent a film.

We are aware that this catalog of films is by no means complete. Although we attempted to contact as many potential sources as possible, by necessity we had to rely on those who responded. Also many of the films included may be available from additional sources. We suggest contacting your local travel clubs and State and local highway and transportation departments about borrowing a film before paying a substantial fee to an organization some distance away. Many of the local chapters of both the American Automobile Association (AAA) and the National Safety Council maintain film libraries. Other good sources include FHWA Regional and Field Offices, Technology Transfer ("T-square") Centers, and Rural Transportation Assistance Program (R-TAP) Centers. You should also be aware that loan and rental films are not always in the best of condition. You should plan on previewing any film before scheduling it for showing to an audience.

There will be periodic attempts to update this catalog. If you come across any films you feel would be appropriate for inclusion in future catalogs, please fill out one of the forms at the back of this catalog and send it to the address indicated.

AASHO Road Test—Pavement Research

A001

This documentary, made in 1962, describes the methods and findings of the AASHO Road Test, which has become the basis for pavement design throughout the world. Conducted at a cost of \$27 million (equivalent to \$89 million in 1986), the AASHO Road Test is the largest and most influential road research project in history. This documentary is available for loan at the cost of first class postage and handling.

About Air Bags

A002

Despite the proven success of air bags in protecting people in frontal car crashes, myths about air bags persist; these and the facts that set them straight are explored. Air bags and safety belts complement each other to provide the best available occupant protection in car crashes. This is shown and discussed using new crash test footage, interviews with crash survivors, testimony by a police superintendent, and on-the-road demonstrations. (1985)

All About Pedestrian Safety

A012

Traffic accidents are the leading cause of death of children aged 1 to 4, and 45 percent of those deaths are pedestrian accidents. Through the use of an entertaining animated fantasy--the adventures of an 8-year-old boy who must teach a visitor from the year 6000 how to walk--the film introduces the concept of pedestrian responsibility in traffic. Helps kids recognize hazards and safely respond to them. Suitable for primary and intermediate school audiences. Request MTI film No. CJ122.

The American Highway: A Way of Life

A013

This film was produced by the Subcommittee on Investigations and Review, of the Public Works Committee, U.S. House of Representatives. A notably brief introduction by Subcommittee Chairman Congressman Jim Wright: "The film you are about to see lasts 28 minutes. It could save your life." The film begins by acknowledging the indispensability of highways to the American way of life, and describes efforts by Congress, Federal and State governments to improve the nation's highway safety record by addressing problems concerning the roadway, the driver, and the vehicle. However, most of the film points out what the Committee has determined are the most prevalent causes of accidents, and all are driver-related causes: alcohol use by drivers, excessive speeding, tail-gating, driving in other drivers' blind spots, excessive use of the horn, and lack of concentration. The Committee offers specific advice to drivers on avoiding these problems, much of it still valid.

Automobile Tire Hydroplaning: What Happens

A024

This film is a joint project of the Federal Highway Administration and the National Aeronautics and Space Administration. Every driver will at some time encounter road conditions that could cause hydroplaning. Only by proper knowledge and understanding of the problem can this threat to highway safety be minimized. This film informs the public of the hazards of automobile tire hydroplaning, which occurs when cars are driven at accepted highway speeds on roadways where there is standing water.

KEY WORDS: BUS DRIVER TRAINING, SCHOOL BUS SAFETY

Building In Highway Survival

B031

The purpose of this film is to demonstrate that collisions with rigid roadside objects, by errant vehicles traveling at moderate to high rates of speed, can be made survivable by engineering design. The design featured in this film is that of early first- and second-generation vehicle impact attenuators. Crash testing in actual and slow motion is depicted along with scenes of real-life on-the-road crashes into these attenuation devices, often placed at the elevated gore sites of freeway exits. Design improvements are made to counteract early device tendency to "pocket" the striking vehicle, making it vulnerable to collision with following vehicles. Demonstrations--again with field tests and "real" crashes--of its effectiveness are shown. Produced by the Federal Highway Administration.

FHWA 16 mm 10 min Loan

Emergency Escape Ramps For Runaway Heavy Vehicles

E011

Truck escape ramps have been used since the mid-1950's. The Federal Highway Administration contracted with the Tennessee Department of Transportation to study these ramps in order to: better understand the philosophies of the design and operation; evaluate the successes and failures of operation; and determine the maintenance requirements. Ramps were divided into three categories for the study: (1) gravity ramps, (2) arrester beds, and (3) combinations of the two. Thirteen conditions are listed that should be met when designing and constructing an escape ramp. (1978)

Engineering for Highway Safety

E014

Although commercially produced, this film offers an excellent historical look at development of crash cushions, or impact attenuators. It describes the first metal drums, frangible plastic barrels filled with sand, and the hydrocushion, the latter especially useful in wide areas such as gores at exit ramps and other freeway bifurcations. They are also effective for side impacts and are reusable when refilled with water. The guard rail energy absorption terminal, trademarked "GREAT", consists of an expendable energy absorbing cartridge and short triple corrugated guard rail sections that telescope when struck by errant vehicles. The uses of portable versions of this device in construction and maintenance zones as well as mounted on the rear of maintenance trucks is effective in shielding the highway worker in a manner "forgiving" to drivers. Produced by Lori Production, Inc. for Energy Absorption Systems, Inc.

An Evaluation Of A Yielding Support System

E016

This film documents the full-scale dynamic crash testing of a new delineator post system developed by the Wyoming Highway Department. The system, consisting of an anchor and stanchion, has several advantages over the one pound "U" channel currently in use in many states. The total cost of replacement materials is lower and the support system is much easier to replace, adding to the overall maintenance efficiency. (1977)

Everyone Pays For Potholes

E017

For every dollar spent by highway agencies to maintain roads, road users pay at least \$60.00 in out-of-pocket costs for extra fuel and car repairs. This program identifies the causes of the problem and presents ideas to solve the problems. Research and new technology are shown. Because the problem exists worldwide, everyone--consumers, government administrators, highway superintendents, educators--is concerned and looking for ways to combat the deterioration. Suitable for grade 10 to adult audiences. Produced by Cornell University. (1982)

Just Another Friday Night

J004

The story of a modern American tragedy on our nation's highways is highlighted in this film produced by the AAA Foundation for Traffic Safety. The film focuses on single-vehicle accidents that all too often involve teenagers, drinking, and high-speed driving with disastrous consequences. The purpose of the film is to involve young drivers in discussion of how society is to deal with drivers in fatal crashes resulting from impaired driving and/or reckless behavior. Driver education and improvement programs will find this film a helpful tool in triggering a lively and important discussion about traffic accidents and their serious consequences. Suitable for grade 9 to adult audiences. (1984)

Preferential Treatment For High Occupancy Vehicles

P025

This FHWA film presents ways that peak-period capacity of urban roads can be augmented relatively quickly, inexpensively, and in an environmentally advantageous and energy-conservative manner. Several innovative techniques for providing preferential treatment for high occupancy vehicles--i.e., to maximize the movement of people rather than vehicles--are illustrated. Examples of reserved lanes for carpools and buses include Shirley Highway (I-395) in Northern Virginia, the San Bernadino Busway in Los Angeles, Interstate 495 between the New Jersey Turnpike and the Lincoln Tunnel, the Long Island Expressway in New York City, and U.S. 101 from the Golden Gate Bridge to Richardson Bay in San Francisco. Other special treatments for buses and carpools include the Blue Streak exclusive bus ramp in Seattle, exclusive bus and carpool lanes at the San Francisco-Oakland Bay Bridge toll plaza, ramp metering with a bus/pool bypass lane for the San Diego Freeway and for I-35W in Minneapolis, exclusive gate use for buses to the Dulles Airport Access Road in Virginia, plus reserved bus lanes, bus streets, contra-flow bus lanes, and bus signal pre-emption in CBD areas as well as fringe parking provisions, off-street bus terminals, and passenger shelters. (1974)

**Priority Highway Facilities For Carpools And Buses
(Carpool Lanes)**

P029

This film not only shows bus priority projects, but shows unique solutions to urban congestion with the use of special facilities for carpools. A few of the projects shown are: San Francisco-Oakland Bay Bridge Roll Plaza, California; Shirley Highway (I-95), Northern Virginia near Washington, D.C.; and Monanalua Freeway, Honolulu, Hawaii. Produced by FHWA. (1977)

MANAGEMENT

Pro Driving Attitudes

P030

This film shows the techniques necessary for a driver to develop a professional, or safer, attitude toward driving. Illustrates the four basic attitudes characteristic of professionals: being alert, being wary, being patient and being considerate, and how anyone can develop these attitudes, one at a time, by being patient with himself.

LA-NSC	16 mm, 3/4-inch U-matic, 1/2-inch VHS	16 min	Rental - \$ 55.00
--------	--	--------	-------------------

KEY WORDS: PROFESSIONAL DRIVERS, DRIVING ATTITUDES

Pro Driving Tactics

P031

Based on the concept "protect yourself with time and space," this film uses animation to show drivers what tactics they can develop to protect themselves from other drivers. Tactics include: maintaining a space shield and a clear field of vision, developing perception and proper eye movement, stopping distances, and the fact that safe driving starts with the driver's consideration of the condition of himself and his vehicle.

Quickchange Moveable Barrier

Q002

This is a promotional film for a product of Barrier Systems, Inc. that was developed and tested in Australia and now is being manufactured and sold in the U.S. The Quickchange Moveable Barrier is comprised of a series of 1-meter-long concrete sections connected by 1-inch-diameter pins at the top and bottom to a steel hinge bar. A tow truck trailer lifts the barrier sections two inches above the pavement and conveys them through an "S" curve to a parallel position from eight to twelve feet from the original position. Examples of this transfer are shown at seven and ten miles per hour. Six crash tests demonstrate the barrier's ability to redirect vehicles ballasted up to 4,400 pounds, traveling at 55 miles per hour, and impacting at both 7.5- and 15-degree angles without vaulting or rollover and with no structural damage to the barrier.

Quiet Highway Design

Q003

This film was produced as part of the National Cooperative Highway Research Program (NCHRP) Project 3-7/3, Establishment of Standards for Highway Noise Levels (FY '73). It provides an introduction to basic concepts and an appreciation of the nature of highway noise problems. Attention is given to noise sources, to the problems of receivers, and to the solutions that are available to the highway designer and others in bringing about reductions in highway-generated noise levels. Available for loan from TRB for the cost of first class postage and handling.

R

Rail-Highway Crossing Corridor Improvements

R001

Discusses various analytic techniques of estimating hazard indices of rail-highway crossing, including the New Hampshire Formula and Oregon method and describes a pilot project of low-cost improvements along a Southern Railway Corridor between Belleville and Fairfield, Illinois. Film includes typical cost breakdown by type of improvement--chevron signs, high-intensity cross bucks, advance warning signs, brush and tree trimming, reconstruction of approach, replacement of 8-inch lenses with 12-inch lenses, new culvert, raising shoulders, and other improvements. The presentation favors the corridor approach to improvements, the involvement of all interested parties (Federal, State, and local agencies plus the railroad company), and the consideration of the various funding options. In this example two Federal agencies, two State agencies, three cities, three counties, and the railroad company were involved. Produced by FHWA.

Self Restoring Barriers (SERB)

S035

Where barriers are necessary, they should accommodate a wide range of vehicle sizes and weights and require minimum maintenance after an impact. Both W-beam and tri-beam guard rails were found to experience extensive damage and to be unable to prevent rollovers when struck by large vehicles. Therefore, FHWA funded research by the Southwest Research Institute (SRI) on a self-restoring barrier. The design developed by SRI uses cables to position the rail about a foot away from the support posts. The rail rides up when hit, adjusting to the size of the vehicle. This film demonstrates the superior performance of SERB to W-beam and tri-beam guard rails in heavy-vehicle impacts. It can also handle many compact automobiles and requires less maintenance after similar impacts. Produced by FHWA. (1981)

Signal Operations Analysis

S038

This presentation of the Signal Operations Analysis Package (SOAP) is a computer program that offers the traffic engineer a practical method for the evaluation of arterial traffic signal systems. The program was developed for the Florida Department of Transportation by the University of Florida. Since development, it has been used extensively by the Florida Traffic Division.

Three types of information are available from SOAP, including: information required for the design of a signalized intersection; intersection evaluation in terms of several measures of effectiveness and a detailed analysis of the variation of the measures of effectiveness under changing operating conditions.

SOAP allows designers to examine a complete range of design alternatives and supports objective traffic engineering decisions. (1980)

Skidding Accidents S046

This film (produced by the Public Works Subcommittee on Investigations and Oversight, U.S. House of Representatives) illustrates wet-weather skidding accidents that occurred on the Interstate Highway I-495 around Washington, D.C. The Subcommittee hoped the film would serve to emphasize their plea to all motorists to exercise more caution when driving on wet pavements. They also expected the film to prompt highway authorities to increase efforts to identify and correct the more hazardous locations of our road system.

The Strategic Highway Research Program

S068

A videotape that describes the motivation and scope of the Strategic Highway Research Program (SHRP), planned and set in motion by the American Association of State Highway and Transportation Officials, grew out of a study conducted by TRB that led to TRB Special Report 202, "America's Highways: Accelerating the Search for Innovation." SHRP focuses on six areas: asphalt, long-term pavement performance, maintenance cost-effectiveness, protection of concrete bridge components, cement and concrete in highway pavements and structures, and chemical control of snow and ice on highways. The need for SHRP and each of the six program areas are discussed and illustrated. The \$30-million-per-year program will begin full-scale operations in approximately 1987, and will have substantial effects on the materials and the methods used in the nation's highway program.

The videotape is a brief, nontechnical, highly visual overview of the program, ideal for communicating the origins and scope of SHRP to general audiences. Transportation managers, public officials, equipment and materials suppliers, trade associations, engineers, contractors, researchers, and consultants will find this introduction a valuable way to obtain information on the Strategic Highway Research Program.

This videotape is available for loan to State departments of transportation at no cost. Others should send appropriate fee to cover mailing and handling costs as indicated for each format.

Symposium Of Human Factors In Traffic Operations

S077

This presentation was recorded live during a Human Factors Symposium. The symposium program (developed by the Federal Highway Administration, Office of Traffic Operations) is designed to keep traffic and design engineers abreast of applicable "Human Factors" developments. The scope of the program is confined to topics relating to driver information systems and traffic control device designs and applications. Participants completing the program will: (1) understand the role of human factors in design and operations; (2) use a fresh approach in looking at driver-related problems; and (3) gain sufficient background to apply relevant human factor findings in their work. Subjects covered include: The Driving Task; Signs; and Guide Sign Evaluation. (1974)

Program For Field Personnel**

T023

A streamlined, at-your-location-with-your-instructor course covering fundamental principles, devices, flagging, use of devices under different conditions, installation, removal sample applications, monitoring, and maintenance and recordkeeping. There are five sessions (modules) with each session consisting of a slide-tape presentation with a course reference text and examinations. The course is designed to be taught in 4-1/2 hours, for construction foremen, workers, and inspectors.

Part 1: Introduction to Work Area Traffic Control (106 slides)
This session provides the individual with the basic principles and standard devices used for work area traffic control. Subjects include work area signs, channelization devices, warning lights, general requirements, and fundamental principles.

Part 2: Selection and Use of Devices (107 slides)
This session explains how to select and use standard devices to create an effective traffic control system. Subjects include basic protection, use of devices under different conditions, and installation and removal.

Part 3: Applications of Work Area Traffic Control (91 slides)
This session discusses sample layouts and strategies for controlling traffic in typical work situations. Subjects include requirements, moving/mobile work examples, short-term stationary work examples, and long-term stationary work examples.

Part 4: Flagging (92 slides)

This session explains flagging principles and practices to include requirements, equipment, flagging stations, procedures, and communication.

Part 5: Monitoring Maintenance and Recordkeeping (45 slides)

This session emphasizes the need for continuous monitoring and inspection of work zones, and provides the individual with sample inspection procedures and checklists. Subjects include inspection procedures, potentially dangerous conditions, positioning and condition of devices, and recordkeeping.

Visual Perception In Driving

V011

Part 1 - Eye Habits**Part 2 - Identification**

A set of two presentations produced for the AAA Foundation for Traffic Safety by the Ohio State University Department of Photography and Cinema. Suitable for grade 9 to adult audiences. (1981)

Part 1: Eye Habits - Most of our driving information is collected by our eyes and our decisions are based on what we see--or think we see. Driver errors leading to accidents often are the result of poor eye habits. Utilizing research data developed at Ohio State University, the film demonstrates how inexperienced and experienced drivers use their eyes in scanning and searching the road ahead. Specific suggestions are presented in the film on how drivers can improve their visual habits.

Part 2: Identification - This film demonstrates that visual perception in driving is more than just seeing. It is the piling up and use of past experience and knowledge through which we interpret what we see and act on in the present. Suggestions are made on how drivers can improve their visual perception by learning to identify important traffic information and organizing it into meaningful patterns.

KEY WORDS: VISUAL SKILLS

Visual Search In Driving

V012

This film describes an eye movement recording system that is used to gather research information about the visual information system. In addition, a number of the findings revealed by the research are illustrated. A unique system allows researchers to observe and record the eye movements of drivers in actual road driving situations. Once the data is recorded on the video tape, it is taken to the Driving Performance Laboratory for data reduction and statistical analysis. While driving, a small light source reflected from the driver's eye is combined with the road-scene picture and other measurement data and is recorded on video tape. Research has been applied to sign design effects, curve negotiation, night driving, the visual search of new drivers, and the effects of alcohol, fatigue, and carbon monoxide on drivers. Thus data is now becoming available on driver information acquisition, which can lead to the design of safer highways and vehicles. Produced by the Ohio State University for the Ohio DOT. (1977)
