

MOUNTAIN-PLAINS CONSORTIUM

RESEARCH BRIEF | MPC 18-370 (project 458) | November 2018

Application of a Multi-Agent System with the Large-Scale Agent-Based Model for Freight Demand Modeling

the ISSUE

North Dakota road and bridge infrastructure is critical to support energy development and the agricultural industry. Due to the nature of infrastructure investment, transportation planning requires long-term projection and large investments of public dollars. Consequently, statewide freight demand modeling is a great tool for planning enhancing effective and efficient investment.

the RESEARCH

In this study, researchers used the agent-based simulation (ABS) for modeling agricultural transportation demand. With the simulation model, geographic information systems (GIS) was utilized to collect and analyze remote sensing of agricultural crops. The researchers reviewed agent-based modeling in freight and public transportation planning to fill the gap between traditional modeling efforts and emerging needs of adopting behavioral modeling for an agricultural transportation model. The study then investigated adoption of an agent-based model for a large-scale travel demand model. The objective of the proposed model was to provide a platform to analyze grain transportation movement at the micro-level, since most industry reports lack such micro-level freight analysis while supporting regional and statewide planning.

Administration

the FINDINGS

Researchers found that the proposed model is capable of handling sophisticated decision-making processes, such as grain pricing strategies, transportation costs, holding costs, and advanced logistics choice model and the behavioral selection process.

the IMPACT

Agent-based simulation for modeling agricultural transportation demand provides a greater level of detail for transportation planning efforts. This level of detail increases accuracy and enhances the ability to accurately project investment needs and target infrastructure investments.
