

MOUNTAIN-PLAINS CONSORTIUM

RESEARCH BRIEF | MPC 24-520 (project 649) | March 2024

Assessment of Safe Work Indicators in Transportation Construction Using Personal Monitoring Systems

the **ISSUE**

Construction projects require long hours where workers are subjected to intensive tasks such as hard manual labor, heavy lifting, and compulsive working postures. Among the physiological metrics, heart rate (HR) is considered a good indicator of physical stress and workload. However, there are no reported studies on HR modeling and forecasting in the construction field.

the **RESEARCH**

The objective of this study was to (1) analyze the effect of physiological factors, including breathing rate, acceleration of torso movements, torso posture, and impulse load, on the HR of construction workers; and (2) model and forecast one-minute ahead HR for construction workers based on their physical activity using deep learning algorithms. To this end, physiological metrics of five bridge maintenance workers performing several construction activities were collected.

Administration

the FINDINGS

The primary contribution of the research is to apply a piloted method developed by the contributing researchers that facilitates comparison of discrete physiological metrics across individuals performing a range of construction activities. This information will be valuable to managers in deciding how to schedule transportation construction workers to maximize both productivity and health, and in establishing indicators and real-time warning systems to prevent undue worker physical stress, with a focus on particular activities and extreme weather conditions.

the IMPACT

Models based on this work have the potential to facilitate the mitigation of cardiovascular strain and enable ongoing prevention of accidents in the construction industry. The research will also establish benchmarks for transportation construction workers' physiological health and performance and written "best practice" guidelines for conducting physical construction activities while constructing physical infrastructure projects.
