NEWS

NATIONAL HIGHWAY SAFETY BUREAU

WASHINGTON, D. C. 20591

FOR MONDAY RELEASE
May 4, 1970

NHSB -- 16-70
(202) 962-8527

The Department of Transportation plans to crack down on the sale and use of so-called "Farm Use Only" tires for normal passenger car use. The Department says such tires are not safe for normal highway use.

The Department's National Highway Safety Bureau proposes to amend Federal Motor Vehicle Safety Standard No. 109, which requires all passenger car tires to meet specific performance tests.

The amendment would require (1) that tires unsafe for highway use be branded with the phrase "Unsafe for Normal Highway Use," (2) that each tire have a label attached indicating that the sale of the tire for passenger car use subjects the person selling it to a \$1,000 civil penalty, and (3) that all tire manufacturers report to the Bureau periodically the number of these tires sold and the name of distributors or dealers who purchase them.

The Notice of Proposed Amendment, issued by NHSB Director Douglas W. Toms, would become effective on October 1, 1970.

The Bureau has conducted an investigation which disclosed that more than 185,000 tires were manufactured for normal highway use during 1969 which later were reclassified and branded with some restrictive language such as "Farm Use Only" or "Non-Highway Use." The tires were reclassified due to some manufacturing defect affecting the tire's performance capabilities.

-more

Toms said many of the reclassified tires are being sold for normal highway use by unscrupulous distributors and dealers who buff off the restrictive labeling information and sell them to the unsuspecting public as sound highway use tires. The use of such tires on passenger cars can present an extreme safety hazard.

In addition, Toms said, because the tires do not contain the D. O. T. symbol (which is part of the labeling requirements of Standard No. 109) their sale for passenger car use is a violation of the National Traffic and Motor Vehicle Safety Act of 1966.

Anyone removing the required label before sale to the user or anyone removing or altering the legend "Unsafe for Normal Highway Use" also would be subject to civil penalties up to \$1,000.

Last December, the Safety Bureau sent letters to all domestic and foreign tire manufacturers detailing its concern about the number of non-certified tires that were being sold for passenger car use.

Interested persons are invited to submit written data, views, or arguments on the proposed amendment by the close of business on May 22, 1970.

NEWS

NATIONAL HIGHWAY SAFETY BUREAU

WASHINGTON, D. C. 20591

FOR IMMEDIATE RELEASE

NHSB -- 17-70
(202) 962-8527

The Department of Transportation's National Highway Safety Bureau today issued an advisory to all vehicle owners who now use, or expect to use in the coming summer months, externally mounted luggage racks.

The Bureau says it is most important that immediately prior to use all luggage racks be physically checked for tightness of all assembly and mounting screws and bolts. This can be done by the vehicle owner, by dealer service, or other maintenance personnel.

Roof luggage racks are installed both at manufacturing plants and by dealers at the time of sale delivery. Racks frequently are secured to the vehicles with sheet metal screws, and they are held together with additional assembly screws or bolts.

The Director of the National Highway Safety Bureau, Douglas W. Toms, disclosed that his staff has completed an investigation of two reports in which loaded luggage racks separated from the roof of station wagons. Toms said, "Impact and vibration studies witnessed by Bureau staff have demonstrated that the racks are structurally adequate and will withstand abuse more severe than should be encountered in heavy use. The tests also showed that the specified roof mounting, when properly maintained, that is, checked physically for tightness, is entirely adequate.

-more-

"While there is no indication of any unreasonable tendency to loosen in service," said Toms, "it is possible, of course, that continued service or particularly heavy use may cause some loosening at assembly and roof mounting points. Obviously, then, periodic checking is a good idea for all luggage racks."

A typical rack failure, which can be caused by looseness of assembly and mounting screws, involves separation of the loaded rack from the roof of the vehicle when traveling at highway speeds. The resulting showering of luggage and pieces of the rack on the highway can have fatal consequences for following vehicles.

With the summer touring season about to begin, the Bureau urges all vehicle owners using any type of external luggage rack to make certain that they are securely fastened.

NATIONAL HIGHWAY SAFETY BUREAU

WASHINGTON, D. C. 20591

FOR IMMEDIATE RELEASE

NHSB --22-70
(202) 426-0686

The Department of Transportation proposes two new Motor Vehicle Safety Standards that would set strict requirements for air brake systems on trucks, buses and trailers.

The proposed standards issued by Douglas W. Toms, Director of the Department's National Highway Safety Bureau, would, if adopted, have an effective date of January 1, 1972.

"The safety afforded by a vehicle's braking system is determined by several factors, including stopping distance, and stability while stopping," Toms said. "Also, there must be features in the system which guard against malfunction, and emergency features which can stop the vehicle should a malfunction occur. The proposed standards would establish requirements for each of these aspects of brake safety for vehicles equipped with air brakes."

Perhaps the most important indication of brake performance is the distance in which a brake system can stop a vehicle from a given speed. The Safety Bureau, therefore, proposes requirements for stopping distances for trucks and buses from 20 miles per hour and 60 miles per hour while traveling both on good roads and on slippery roads.

-more-

A second important characteristic is the stability of the vehicle while stopping. The proposed rules would require that trucks and buses meet the stopping distance requirements without skidding the wheels, and that trailers also stop without skidding the wheels. A skidding wheel loses all directional stability.

To deal with problems of balance between brakes on trucks and their trailers, the notices propose to specify identical relationships between brake chamber air pressure and brake retardation force. Requirements for brake actuation and release times are proposed which increase the responsiveness of the brakes and further insure a balance between trucks and trailers.

The proposed regulations also would require that a brake retain adequate stopping power despite high temperatures caused by repeated decelerations. The ability of a brake to effectively recover after high temperature operation also has an important bearing on vehicle safety, and the Notices propose a brake recovery requirement.

To protect the brake system against the consequences of malfunction, the Notices propose to require several items of equipment, including valves and similar devices to protect the air reservoirs from pressure loss due to leakage in the system, and on trucks and buses, a low pressure warning signal and a pressure gauge for each reservoir.

In the event of air pressure loss in the system, emergency features are proposed to enable the vehicle to be brought to a stop. A split service brake system is proposed for trucks and buses which could stop the vehicle with part of the system inoperable. A parking brake system also is proposed on all vehicles which would be actuated automatically if air pressure falls below a specified point.

Interested persons are invited to submit written data, views, or arguments on the proposed rule making by close of business on September 21, 1970.

NATIONAL HIGHWAY SAFETY BUREAU

WASHINGTON, D. C. 20591

FOR RELEASE WEDNESDAY, P.M.
June 3, 1970

NHSB -- 20-70
(202) 426-0686

The Department of Transportation today announced that Dunlop of France has agreed to pay \$22,500 in settlement of a claim against the firm for producing tires in violation of the National Traffic and Motor Vehicle Safety Act of 1966.

The agreement is a result of negotiations following notification to the company in March that the National Highway Safety Bureau was prepared to submit the case to the Department of Justice with a recommendation that civil penalties be sought.

The tires involved in the case were the CT 650 x 13 passenger car tires manufactured by Dunlop of France between January 1, 1968 and August 1, 1968. Tests conducted for the National Highway Safety Bureau showed that 9 out of 48 such tires failed to meet the endurance requirements and 30 of 56 failed the strength requirements of Federal Motor Vehicle Safety Standard No. 109.

The National Highway Safety Bureau issued a public advisory on February 5, 1970, warning motorists that continued use of these tires could be hazardous under certain conditions.

The company agreed to the settlement in lieu of a court trial. The NHSB has notified the company that its files in this case are now closed.

NATIONAL HIGHWAY SAFETY BUREAU

WASHINGTON, D. C. 20591

FOR RELEASE FRIDAY A.M.
June 19, 1970

NHSB — 25 -70
(202) 426-0686

The Department of Transportation has notified the Goodyear Tire and Rubber Company and the B. F. Goodrich Company that they may have violated the National Traffic and Motor Vehicle Safety Act of 1966.

Douglas W. Toms, Director of the Department's National Highway Safety Bureau, said the two companies had produced passenger car tires that failed to comply with Federal Motor Vehicle Safety Standard No. 109.

Bureau officials said three groups of Goodyear tires are involved. They are Goodyear's 6.50 x 13 Power Cushion tires; 7.00 x 13 Power Cushion tires; and 9.15 x 15 Custom Power Cushion tires.

Of the 6.50 x 13 Power Cushion tires tested by independent laboratories for the NHSB, 15 of 65 failed the endurance test of the standard, 6 of 66 failed the high speed test and 6 of 66 failed the strength test. Ten of 59 Power Cushion Tires, size 7.00 x 13, failed the strength test and 6 of 52 Custom Power Cushion tires, size 9.15 x 15, failed the high speed test.

-more-

Goodyear previously had recalled 6.50 x 13 Power Cushion tires produced in January 1969, and, after meetings with NHTSB officials, also recalled its 7.00 x 13 Power Cushion tires produced in May, June and July 1968, and 9.15 x 15 Custom Power Cushion tires produced in January 1969.

The Goodrich tires that showed compliance testing failures are in the company's Silvertown 660 line. A total of 46 of 54 Goodrich 6.50 x 13 tires failed the strength test, and 6 of 49 failed the high speed test in the same size. Four of 51 failed the high speed test in the 6.95 x 14 category, while 14 of 48 failed the high speed test in the 8.55 x 14 size.

Goodrich has recalled 6.50 x 13 tires produced from January 1, 1968, to September 30, 1968, and 8.55 x 14 tires produced in March 1968.

The NHTSB said it is considering seeking civil penalties against Goodyear and Goodrich for violations of the National Traffic and Motor Vehicle Safety Act of 1966. Under the Act, manufacturers are liable for a civil penalty of \$1,000 for each violation and up to \$400,000 for a related series of violations.

The Bureau said the companies have been given 30 days to submit any mitigating information, data or arguments relevant to this matter.
